Waste from a recharge well mixed with natural groundwater and part of this waste was recovered by a neighboring discharge well. These two wells are situated in a confined aquifer through which there is a natural uniform flow. The wells fully penetrate the aquifer, the flow is steady, and the aquifer medium is homogeneous and isotropic. The density and viscosity of the recharge water are the same as the natural groundwater. By the application of potential flow theory based on Darcy's law, the flow field may be generated by the superposition of a source, a sink, and a uniform flow. Longitudinal dispersion is negligible compared to convection in the case of a single recharge well in an aquifer with uniform flow. In the convective dispersion equation, seepage velocity is replaced by the uniform flow velocity. The longitudinal dispersion term is neglected. A closed form solution is obtained for the discharge well concentration as a function of position (relative to the recharge well), pumping rate of both wells, and lateral dispersion. Part of the computer program used to solve the equations is given. (Knapp-USGS)

PHYSICO-CHEMICAL CHARACTERISTICS OF THE MUNICIPAL WASTE WATERS OF THE GREAT MONTREAL AREA (QUEBEC) (CARACTERISTIQUES PHYSICO-CHIMIQUES DES EFFLUENTS URBAINS DE L'AGGLOMERATION DE MONTREAL (QUEBEC)),
National Inst. of Scientific Research, Quebec.
D. Mascolo, D. Cluis, D. Couillard, and M. Meybeck.
INRS-Eau Technical Report No 4, June 1972. 20 p, 9 tab.

Descriptors: *Sewage effluents, Quality control, *Chemical analysis, *Monitoring, Phosphates, Biochemical oxygen demand, Chemical oxygen demand, *Canada, Water pollution sources, Pollutant identification.
Identifiers: *Montreal.

A study of 34 effluents (sewage) of the Montreal area (Quebec) was performed during summer 1971. The effluents of different types (i.e., domestic raw sewage), treated sewage, combined sewage-storm overflow are discharged into the Des Mille-Iles and the Des Prairies rivers. During a period of 36 hours, discharge was measured every 15 minutes and samples were taken every 30 minutes. Composite 6 hours samples were subjected to the following analyses: BOD5, COD, dissolved oxygen, orthophosphates, total phosphates, NO2, NO3, CL-, ABS, total solids, and conductivity. Daily per capita loading were calculated; typical daily loading were: 49g. BOD per capita, 117 g. COD per capita, and 5.3g. total phosphates per capita, corresponding to a daily water consumption of 120 US gallons per capita. (INRS-Eau)

EXPERIMENTAL STUDY ON THE ADSORPTION OF POLIO VACCINE VIRUS TYPE 2, DURING FILTRATION THROUGH MILLIPORE-MEMBRANE FILTERS (IN GERMAN),
Mainz Univ. (West Germany). Hygiene Institut.
A. Hechmat.

Zentralbl Bakteriol Parasitenkd Infektionskr Hyg Erste Abt Orig Reihe A Med Midrobiol Parasitol, Vol 219, No 4, p 420-425, 1972, English summary.
Identifiers: Adsorption, Bacteria, Filters, *Filtration, *Membrane filters, Millipore, *Polio virus types, Vaccine, *Virus.

In the field of water-hygiene, especially in identification of virus in surface and waste water, it is often necessary to free the sample water from turbid substances and bacteria. Whereas some examiners pointed out the adsorbing ability of membrane filters for virus, others did not regard the phenomenon to be disturbing. Since millipore-membrane filters as cellulose-derivatives are often used in practice, the DAWP-filter with a medium pore-diameter of 650 nm was chosen to show the adsorption-effect for a stock of poliomyelitis-virus at different pH values and salt-concentrations. In a millipore-membrane filter with a diameter of 14 cm varying quantities of the given virus-substance are retained. When using distilled water as suspending agent, the smallest quantity is found. An increase in the NaCl-concentration of the solution leads to increased adsorption of the virus particles. Use of a 0.66 M phosphate-buffer also leads to distinct loss of virus in the filtered substance. The findings with pH 5 and pH 8 are nearly identical. Filtration experiments with a filter-diameter of 5 cm and an 8-9 times greater load for the filter did not cause a remarkably different loss of virus. The effect of a higher salt-concentration on the adsorption of virus is noted.--Copyright 1973, Biological Abstracts, Inc.

MERCURY IN THE PULP AND PAPER MILL ENVIRONMENT--APPRAISAL AND PERSPECTIVE,
Westvaco Corp., Laurel, Md. Laurel Research Center.
J. Marton, and T. Marton.
Tappi, Vol 55, No 11, p 1614-1618, Nov 1972. 7 tab, 15 ref.

Descriptors: *Mercury, *Water pollution sources, *Pulp and paper industry, *Air pollution, Surveys, Fuels, Fossil fuels, Coals, Water pollution, Incineration.
Identifiers: Mercury compounds.

The contribution of the pulp and paper industry to mercury-cause pollution of air and water was investigated by studying mercury discharges in the vicinity of five pulp and paper mills. Although the U.S. paper industry no longer uses mercurial chemicals, its main raw materials still contain mercury as a contaminant. Only a minor amount, ca. 0.1 lb. of mercury per ton of pulp produced, is discharged into waterways. Its accumulation in riverbeds around three of the mills studied was barely detectable. The mercury content of several paper and board products was determined at approx. 0.1 ppm. About 25% of the paper produced in the U.S.A. is being incinerated. Even if all paper were burned, releasing about 14 tons per year of mercury into the atmosphere globally, it would constitute only a small fraction of the approximately 5000 metric tons released by combustion of fossil fuels, not to speak of a similar amount (5000 tons) discharged annually into rivers by diverse other industrial and agricultural activities. The most significant airborne discharge of mercury by the paper industry, viz., 1-2 lb. per 1000 tons of pulp manufactured, stems from combustion of coal. The fuel consumption of the paper industry represents only about 25% of all coal being burned. (Brown-IPC)

METHANOL, ETHANOL, AND ACETONE IN KRAFT PULP MILL CONDENSATE STREAMS,
WashingtonUniv., Seattle. Coll of Forest Resources.
D. F. Wilson, I. N. Johanson, and B. F. Hrutfiord
Tappi, Vol 55, No 8, p 1244-1246, Aug 1972. 1 fig, 3 tab, 10 ref.

Descriptors: *Water pollution sources, *Pulp wastes, *Alcohols, Organic compounds, Biochemical oxygen demand, Effluents, Pollutants, Waste water (Pollution), Softwood, Hardwood, Deciduous trees, Coniferous trees, Hemlock trees, Douglas fir trees, Industrial wastes, Byproducts, Pulp and paper industry.
Identifiers: *Methanol, *Ethanol, *Acetone, Ketones, Kraft mills, Condensates, Steam volatile compounds, Pulpwood, Alder (Alnus), Western red-cedar (Thuja plicata), Red-cedar trees (Thuja).

Methyl and ethyl alcohols and acetone are major water-soluble, steam-volatile compounds found in kraft pulp mill condensate streams. As important sources of biodegradable organic matter, they have been estimated to contribute one-third of the total effluent BOD in a kraft linerboard mill. The amount of methanol in particular depends on the pulpwood species. Hardwoods can yield about twice as much methanol as do softwoods. Depending on pulping conditions, condensate streams contain about 8 lb methanol per ton of pulp for coniferous species and 12 lb per ton for deciduous species. Laboratory digestions have yielded nearly double these amounts, viz., 14-16 lb per ton for western hemlock and Douglas-fir, and 26-28 lb per ton for red alder and western red-cedar. Individual condensate streams showed methanol concentrations ranging from 300 to 8000 ppm. Evaporator condensate contained the largest total amount, but the lowest concentration of methanol. Digester relief condensate had the highest concentration. The amount of ethanol plus acetone was only about one-tenth that of methanol. (Brown-IPC)

COLOR OF PULP INDUSTRY WASTE LIQUORS. II. AUXOCHROMES AND CHROMOPHORES IN CHLORINE-OXYLIGNIN (IN JAPANESE).
Kyushu Univ., Fukuoka (Japan). Faculty of Agriculture.
K. Sameshima, M. Sumimoto, and T. Kondo.
Mokuzai Gakkaishi (Journal of the Japan Wood Research Society), Vol 18, No 4, p 191-196, 1972. 10 fig, 10 ref. (English summary).

Descriptors: *Bleaching wastes, *Color, *Waste water (Pollution), *Pulp wastes, *Lignins, Molecular structure, Hydrogen ion concentration, Industrial wastes, Pollutants, Foreign research.
Identifiers: Functional groups, Chromophores, Quinones, Carbonyl groups, Kraft mills, *Japan.

Chlorine-oxidized lignin was the major color body in effluents from multistage kraft pulp bleaching plants. The importance of acidic functional groups as auxochromes was indicated by the dependence of the color of oxylignin on its solution pH and its degree of methylation, i.e., methoxyl group substituents. Unlike in other lignin preparations, both weak and strong acidic groups in oxylignin function as characteristic auxochromes. Reduction with sodium borohydride indicated that carbonyl groups were the most important of the complex auxochromes in oxylignin, and that these groups, possibly including hydroxybenzoquinone structures, were closely related to the auxochromic acidic groups. ESTIMATION OF GROWTH RATE FROM MITOTIC INDEX,
California Univ., Davis. Dept of Bacteriology
K-T Chung, E. H. Nilson, M. J. Case, A. G. Marr, and R. E. Hungate
Applied Microbiology, Vol 25, No 5, p 778-780, May 1973. 3 fig, 1 tab, 10 ref.

Descriptors: *Growth rates, *Cytological studies, Estimating, *Microorganisms, E. coli, Growth, Equations, Inhibitors.
Identifiers: *Mitosis, Data interpretation, Chloramphenicol.

The growth rate of a eukaryotic population dividing at a constant rate can be estimated from the equation, t sub m/g ln 2 equals l/n (1 plus R), in which t sub m is the time required for mitosis, g is the generation time, and R is the fraction of cells undergoing mitosis. Values for t sub m and R can be determined by direct microscope examination of the population. The validity of the derived equation has been checked with an exponentially growing culture of a prokaryote, Escherichia coli, in which chloramphenicol was administered to inhibit protein synthesis. Cells having enough protein completed the division process whereas the rest of the population was inhibited. From the plot of the growth curve before and after administration of chloramphenicol, t sub m and R were estimated. The calculated and actual growth rates were almost identical. (Holoman-Battelle)

AMMONIUM REGULATION IN ASPERGILLUS NIDULANS,
Glasgow Univ. (Scotland). Dept. of Genetics.
J. A. Pateman, J. R. Kinghorn, E. Dunn, and E. Forbes.
Journal of Bacteriology, Vol 114, No 3, p 943-950, June 1973. 2 fig, 3 tab, 16 ref.

Descriptors: *Absorption, *Pathogenic fungi, Model studies, Path of pollutants, Enzymes, Nitrogen compounds, Inorganic compounds, Organic compounds.
Identifiers: *Ammonium, *Mutants, *Aspergillus nidulans, *Regulation (Chemical), NADP-glutamate dehydrogenase, L-Glutamate, Thiourea, Methylammonium, Chemical concentration, Biological magnification, Nitrate reductase, Actionmycetes.

L-Glutamate uptake, thiourea uptake, and methylammonium uptake and the intracellular ammonium concentration were measured in wild-type and mutant cells of Aspergillus nidulans held in various concentrations of ammonium and urea. Mycelia for uptake and enzyme assays were grown in shaken cultures at 25C for 18-20 h, harvested, and, for enzyme assays, extracted according to Cove (1966). The levels of L-glutamate uptake, thiourea uptake, nitrate reductase, and hypoxanthine dehydrogenase activity are determined by the extracellular ammonium concentration. The level of methylammonium uptake is determined by the intracellular ammonium concentration. The uptake and enzyme characteristics of the ammonium-derepressed mutants, meaA8, meaB6, DER3, amrA1, xprD1, and gdhA1, are described. The gdhA mutants lack normal nicotinamide adenine dinucleotide phosphate-glutamate dehydrogenase (NADP-GDH) activity and are derepressed with respect to both external and internal ammonium. The other mutant classes are derepressed only with respect to external ammonium. The mutants meaA8, DER3, amrA1, and xprD1 have low levels of one or more of the L-glutamate, thiourea, and methylammonium uptake systems. A model for ammonium regulation in A. nidulans is put forward which suggests: (i) NADP-GHD located in the cell membrane complexes with

xtracellular ammonium. This first regulatory omplex determines the level of L-glutamate up- ake, thiourea uptake, nitrate reductase, and anthine dehydrogenase by repression or inhibi- ion, or both. (ii) NADP-GDH also complexes with ntracellular ammonium. This second and different orm of regulatory complex determines the level f methylammonium uptake by repression or in- ibition, or both. ITRATE REDUCTION AND THE GROWTH OF VEILLONELLA ALCALESCENS,
Cornell Univ., Ithaca, N.Y. Div. of Biological Sciences.
C. B. Inderlied, and E. A. Delwiche.
Journal of Bacteriology, Vol 114, No 3, p 1206-1212, June 1973. 3 fig, 6 tab, 16 ref.

Descriptors: *Anaerobic bacteria, *Pathogenic bacteria, *Reduction (Chemical), *Nitrates, *Essential nutrients, Absorption, Growth rates, Inhibitors, Chemical reactions, Enzymes, Nitrogen compounds, Ammonium salts, Cultures, Respiration, Nutrient requirements.
Identifiers: *Veillonella alcalescens, Bacterial physiology, Nitrate reductase, Substrate utilization, Assimlation, Pyruvate, Ammonium chloride, Growth media.

Veillonella alcalescens, a strict anaerobe, was found to possess a nitrate reductase system which has characteristics of both assimilatory and respiratory nitrate reduction. The nitrate reductase has been identified tentatively as a particulate enzyme which utilizes a variety of electron donors for the reduction of nitrate. By use of N-15-labeled nitrate, it was shown that under appropriate conditions nitrate nitrogen is incorporated into cell material. V. alcalescens grown on pyruvate and nitrate has a greater growth rate than cells grown on pyruvate alone. Growth can occur in a medium with hydrogen and nitrate as the sole energy source. Ammonium chloride decreases the rate of nitrate reduction but does not completely inhibit reduction or incorporation. The results suggest that nitrate assimilation and respiration are not as distinct as in some other organisms. (Holoman-Battelle)

SOLVENT CHARACTERIZATION BY GAS--LIQUID PARTITION COEFFICIENTS OF SELECTED SOLUTES,
Chemische Werke Huels A.G., Marl (West Germany).
L. Rohrschneider.
Analytical Chemistry, Vol 45, No 7, p 1241-1247, June 1973. 2 fig, 5 tab, 11 ref.

Descriptors: Gas chromatography, Solubility, Water, Solvents, Alcohols, Ethers, *Solutes.
Identifiers: *Partition coefficients, *Organic solvents, Molecular volume, Solvent polarity, Toluene, Ethanol, Methyl ethyl ketone, Dioxane, Nitromethane, Octane.

A method is given for the determination of gas-liquid partition coefficients by gas chromatographic headspace analysis with two different columns. The partition coefficients of n-octane, toluene, ethanol, methyl ethyl ketone, dioxane, and nitromethane are specified for eighty solvents. The correlations of these data with solvent polarity, solubility parameter, and the molecular volume of the solvents are discussed. The measured data reference to the aromatics selectivity of extraction solvents and the solubility for polymers in diverse solvents. (Little-Battelle)

MERCURY AND OTHER TRACE METALS IN THE ENVIRONMENT. A COMPILATION OF FEDERAL GOVERNMENT RESEARCH PROJECTS AND SURVEYS AUGUST 1971.
Department of Energy, Mines and Resources, Burlington (Ontario). Canada Center for Inland Waters.

Report, August 1971. J. W. Schmidt, Compiler. 50 p, 4 ref.

Descriptors: *Mercury, *Analytical techniques, *Water pollution effects, *Water pollution sources, Trace elements, Heavy metals, Primary productivity, Pollutant identification, Sediments, Fish physiology, Nitrilotriacetic acid, Food chains, Bioindicators, Bioassay, Pesticides, Toxicity, Soils, Water analysis, Fish, Absorption, Arctic Ocean, Clams, Canada, Great Lakes, Lake Erie, Lake Ontario, Chelation, Suspended solids, Boron, Pesticide residues, Geochemistry, Lead, Nickel, Zinc, Cadmium, Wastes, Sludge, Mass spectrometry, Copper, Salmon, Iron, Molybdenum, Manganese, Aluminum, Cobalt, Chromium, Strontium, Acid mine water, Cations, Separation techniques.
Identifiers: Methyl mercury, Lake Winnipeg, Lake of the Woods, Saskatchewan River, Lake St. Clair, Ligands, Le Have River, Barium, Silver, Tithium, Thalium, Uranium, Vanadium, Atomic absorption spectrophotometry, Biological samples, Arsenic, Selenium.

Brief summaries are presented of Canadian research projects related to mercury and other trace elements in the environment. Recent publications and research grants are also listed. The purpose was to allow those working in the area to become more aware of other groups and individuals who are actively pursuing related projects and to thus stimulate cooperation. The projects covered include work related to the analysis of water, soil, and sediments for mercury and other toxic metals, the sources of mercury in the environment, and the effects of mercury and other trace elements on aquatic flora and fauna. A STUDY OF NUTRIENT VARIATIONS IN THE SURFACE AND MIXED LAYER OF MONTEREY BAY USING AUTOMATIC ANALYSIS TECHNIQUES,
Naval Postgraduate School, Monterey, Calif.
G. O. Paulson.
Available from the National Technical Information Service as AD-757 700. Master's Thesis, September 1972. 151 p, 57 fig, 9 tab, 21 ref.

Descriptors: Surface waters, *Automation, Variability, *Sea water, *Mixolimnion, *Nutrients, Essential nutrients, Water circulation, Chemical analysis, Water analysis, Methodology, Mixing, Silicates, Phosphates, Nitrates, Nitrites, Depth, Eutrophication, Upwelling, Limiting factors, Chlorophyll, Nitrogen compounds, Ecological distribution, Plankton, Water sampling, Salinity, Profiles, Colorimetry, Instrumentation, Research equipment, Iron, Color, Turbidity, Sulfides, Oceanography, Pollutant identification, *California.
Identifiers: *Monterey Bay, Technicon Autoanalyzer II System, Shipboard measurements, On board analysis, Reproducibility, Sensitivity, Accuracy, Error sources, Data interpretation, Orthophosphates, Chemical interference, Tannins, Precision, Assimilation.

Concentrations of silicate, phosphate, nitrate, and nitrite were determined in Monterey Bay, California. Data were collected aboard ship during four cruises in April and May, 1972 using the Technicon (Trademark) AutoAnalyzer (Trademark) II System in dual channel operation. The sensitivity, reproducibility, and accuracy of this system were investigated and the results presented. Nutrient concentrations were presented as surface variations, depth variations, and vertical profiles. The large variability of nutrient concentrations in the ocean area studied was discussed. Upwelling areas were investigated for nutrient concentrations, circulation patterns, and variations in nutrient ratios. Planktonic bloom areas have been identified from the low nutrient levels, low nutrient ratio values, and high chlorophyll correlations. Results indicate that silicate was the limiting nutrient to biological activity in the waters studied. Assimilation ratios for biological activity were found to be 16.33 for NO3:PO4 and 1.14 for SiO4:PO4. Nutrient plateau regions were analyzed and sources discussed. The major cause of nutrient concentration changes in the area (except plankton blooms) as determined from nutrient ratio studies was found to be circulation of the water masses. (Holoman-Battelle)

MODELING SNOWMELT RUNOFF IN AN ARCTIC COASTAL BASIN,
R. Carlson, W. Norton, and R. Britch.
Paper presented at International Symposia on the Role of Snow and Ice in Hydrology, UNESCO-Session: WMO-2b, September 6-13, 1972. Banff, Canada. 14 p, 5 fig, 6 ref. OWRR A-031-ALAS (2).

Descriptors: *Snowmelt, *Runoff forecasting, *Arctic, *Alaska, *Model studies, Oil industry, Oil spills, Analytical techniques, Hydrographs, Climatic data, Path of pollutants.
Identifiers: *Snowmelt runoff forecasting.

Present and impending oil exploration and development activity on Alaska's Arctic Coastal Plain has led to a need for a better understanding of the region's water resources. The remoteness of the area and an almost complete lack of hydrologic data preclude the use of the usual hydrologic analysis techniques. As a possible alternative, a snowmelt-runoff model has been developed which simulates this important part of the hydrologic system, and which causes most of the outflow. The initial model simulation operates in two parts. The first is a snowmelt hydrograph generation program which uses a four-component energy teansfer computation to transform climatological information into snowmelt. The second part uses a two-parameter linear storage model to transform the snowmelt hydrograph into the runoff hydrograph. A test run using 1971 data for the Putuligayak River basin indicates that the model performs satisfactorily, although a need for improvement is clearly indicated. Future model development will investigate an inclusion of a delay factor in the snowmelt process, a further delineation of the surface and channel storage, and a provision for channel delay. RELATION OF CHANNEL SLOPE TO REAERATION OF MICHIGAN STREAMS,
Geological Survey, Okemos, Mich.
T. R. Cummings.
Open-file report, May 1973. 19 p, 5 fig, 1 tab, 4 ref.

Descriptors: *Reaeration, *Streams, *Michigan, Water pollution, Mathematical studies, Equations, Regression analysis, Correlation analysis, Channel morphology, Depth, Streamflow, Flow rates, Average flow, Low flow, Water quality, Waste assimilative capacity, Organic wastes, Self-purification.
Identifiers: *Reaeration coefficients.

Reaeration coefficients (k2), which are rate constants for the process of oxygen absorption from the atmosphere, were computed for Michigan's streams using an equation developed by Bennett and Rathbun (1972). Mean velocity and mean depth data, which are necessary for the computation, were extracted from discharge measurements made at gaging stations throughout the State. The computed k2 values were related to channel slopes obtained from topographic maps. Regression equations were derived that express the relation of k2 to slope for streams at mean flow, median flow, 7-day 2-year low flow, and 7-day 10-year low flow. The equations indicate that an increase in channel slope or a decrease in streamflow increases k2. (Woodard-USGS)

TRINITY BAY STUDY: DYE TRACING EXPERIMENTS,
Tracor, Inc., Austin, Tex.
G. H. Ward, Jr.
Available NTIS, Springfield, Va 22151 as N73-17510, Price $3.00 printed copy; $1.45 microfiche. Contract Report to NASA, Manned Spacecraft Center, November 1972. 121 p, 60 fig, 20 tab, 14 ref. NAS 9-12724.

Descriptors: Water pollution sources, *Path of pollutants, *Thermal pollution, *Dye releases, *Bays, *Texas, Aerial photography, Satellites (Artificial), Sampling, Fluorescent dye, *Fluorometry, Remote sensing, Correlation analysis, Winds, Currents (Water), Salinity, Dispersion, Electric powerplants.
Identifiers: *Trinity Bay (Tex).

The NASA/MSC Trinity Bay Study (NASA, 1971) has focused upon the heat balance and temperature distribution within Trinity Bay, Texas, particularly as affected by Houston Lighting and Power Cedar Bayou Generating Station, which draws its cooling water from behind Atkinson Island in upper Galveston Bay and discharges into upper Trinity Bay above Point Barrow. One of the predominant factors governing the distribution of temperature (and, especially, the thermal plume configuration at the Cedar Bayou discharge) is the hydrodynamics of the Trinity Bay System. This is conventionally dichotomized as advective and dispersive. Among the former are included the effects of tidal currents, wind-driven circulations, and large-volume inflows. Among the latter are the effects of turbulent diffusion and local shears in the currents. In practice, there is not clear separation between these two classes of hydrodynamic processes; this depends, in part, upon the resolvable scales of motion, which in turn is determined by methods of measurement and the mathematical representation. (the 'model'). The dye-tracing experiments address specifically the dispersion processes, although advective information is extracted as well, when appropriate. (Woodard-USGS)

TRANSFER OF CS-137 FROM DETRITUS TO PRIMARY PRODUCER,
Oak Ridge National Lab., Tenn.
M. Witkamp.
Available from the National Technical Information Service as CONF-711213-1. Report December 13, 1971. 12 p, 2 fig, 2 tab, 3 ref.

Descriptors: *Detritus, *Cycling nutrients, *Tracers, *Path of pollutants, Model studies, Vegetation, Ecosystems, Laboratory tests, Radioecology, Systems analysis, Food chains, Trophic level, Plant growth, Animal growth, Snails, Trees, Analog computers, Computer models, Analog models, Decomposing organic matter.
Identifiers: Mobilization, *Cs-137, *Transfer coefficients, Cesium radioisotpes, Paravitrea, Millipedes, Fate of pollutants, Dixidesmus erasus, Plants.

A combination of radiotracer, microcosm, and systems analysis techniques was used in evaluating recycling of minerals from detritus back to the vegetation. A greenhouse experiment with microcosms of increasing complexity showed the effects of millipedes and snails on Cs-137 movement from leaf litter to tree seedlings. Millipedes increased the organic matter content of the soil and the concentration and availability of Cs-137. The increase in growth and mineral uptake by plants suggests that millipedes affect both nutrient and Cs-137 kinetics in similar ways. With snails there were smaller increases in Cs-137 turnover in soil and less tree growth than with millipedes. Snails also reduced plant growth by consuming part of the foliage. Gross transfer coefficients for movement of Cs-137 from detritus to plants were determined through analysis of Cs-137 turnover using a simulation model. (Holoman-Battelle)

ECOLOGICAL CONCEPT OF THE COASTAL ZONE IN THE GREAT LAKES,
Michigan Univ., Ann Arbor. Great Lakes Research Div.
C. L. Schelske.
Available from the National Technical Information Service as COO-2003-10. Report, May 1971. 16 p, 2 fig, 1 tab, 14 ref.

Descriptors: *Ecosystems, *Great Lakes, *Ecology, *Aquatic environment, Coasts, Salinity, Flow, Water circulation, Path of pollutants, Nutrients, Water temperature, Thermal stratification, Waste assimilative capacity, Lake Michigan, Lake Erie, Lake Ontario, Lake Superior, Lake morphometry, Lake Huron, Discharge (Water), Chlorides, Upwelling, Aquatic productivity.
Identifiers: *Coastal zones, Marine environment, Thermal bar, Fate of pollutants.

The coastal zone of the Great Lakes may be similar to the marine coastal zone in many respects, but in terms of ecological processes it must be viewed as part of the lake ecosystem and cannot be treated separately. Some of those differences between the coastal zones include salinity, residence times of water, circulation period, biological productivity, limiting nutrients, and the direction of the flow of water. In order to study the coastal zone adequately, the entire lake ecosystem must be studied. For some types of problems, such as chloride pollution, the five Great Lakes must be considered as a system. ESTIMATION OF ESTUARINE MARSH PRODUCTIVITY,
Delaware Univ., Newark. Dept. of Biological Sciences.
E. De Michele.
Journal of the Environmental Engineering Division, American Society of Civil Engineers, Vol 99, No EE3, p 397-404, June 1973. 1 fig, 1 tab, 14 ref.

Descriptors: *Aquatic productivity, *Estimating, *Estuarine environment, *Tidal marshes, *Measurement, *Biochemical oxygen demand, Primary productivity, Model studies, Turbulent flow, Transportation, Dispersion, Organic matter, Adsorption, Equations, *Delaware.
Identifiers: *Murderkill River (Del), Convective-diffusion equation.

The adsorptive and absorptive capabilities of tidal marshlands, have, in the past, been estimated using various techniques. Thus far it has been dif-

ficult to measure the organic matter representative of marsh productivity. To eliminate some of the distortions associated with such measurements, a model based on the convective-diffusion equation was used to estimate 5-day BOD additions from a tidal marsh to a northern temperature zone estuary. Use of the model involves: (1) determination of river coefficients for conservative and nonconservative substances, based on measured concentration profiles, for periods of maximum and minimum marsh activity; and (2) calculation of river reaction rates. Organic removals for the two periods of extreme marsh activity then may be compared to provide a means of estimating net marsh productivity. Data collected over a 6-yr period were used to demonstrate the previously described technique. The extensive marshy area fringing Delaware's Murderkill River estuary (drainage area of 107 sq miles) is found to contribute 1,050 lb per day 5-day biochemical oxygen demand during the summer months. No attempt was made to evaluate contribution per unit area of marsh. (Holoman-Battelle)

5C. Effects of Pollution

ECOLOGICAL IMPLICATIONS OF DIMETHYL MERCURY IN AN AQUATIC FOOD CHAIN,
Utah Water Research Lab., Logan.
L. P. Kolb, D. B. Porcella, and E. J. Middlebrooks.
Available from the National Technical Information Service as PB-222 971, $3.50 in paper copy, $1.45 in microfiche. Research Project Technical Completion Report PRWG105-2, June 1973. 50 p, 18 fig, 29 tab, 44 ref. OWRR B-070-UTAH (3). 14-31-0001-3659.

Descriptors: *Mercury, *Bioassays, Toxicity, Ecosystems, *Food chains, *Algae, *Daphnia, Fish, *Volatility, Metabolism, Water pollution effects, Path of pollutants.
Identifiers: Methylation, *Dimethyl mercury, *Fathead minnows, Microbial methylation, Desorption.

Laboratory studies indicate dimethyl mercury may be a major product of microbial methylation in organic mercury. Although another methylation product, monomethyl mercury, has been extensively studied, the physical, chemical, and biological factors affecting the transport and food chain distribution of dimethyl mercury have remained unclear. Results are presented of laboratory studies of volatilization rates from water as a function of temperature and mixing conditions, uptake kinetics and equilibrium concentrations in algae, Daphnia, and fish, toxicity to fish, and studies of metabolism of dimethyl mercury by microbes. Mercury - 203 labeled dimethyl mercury was used in the study, and in all tests the organisms used were live counted. A unique method was developed for measuring dimethyl mercury uptake in algae. In water, dimethyl mercury was found to behave similarly to nonreactive gases such as oxygen. Volatilization occurred rapidly.

AN INVESTIGATION OF THE CAUSE AND EFFECT OF EUTROPHICATION IN LONG LAKE, WASHINGTON,
Eastern Washington State Coll. Cheney. Dept. of Biology.
R. A. Soltero, A. F. Gasperino, and W. Graham.
Available from the National Technical Information Service as PB-222 937, $3.75 in paper copy, $1.45 in microfiche. Project Completion Report, July 1973. 86 p, 18 fig, 23 tab, 45 ref. OWRR A-058-WASH (1).

Descriptors: *Nutrients, Nitrogen, *Eutrophic action, Productivity, Chlorophyll, Phytoplankton, Zooplankton, *Washington, Water pollution sources, Phosphates, Primary productivity.
Identifiers: Long Lake (Wash), *Nitrate-nitrogen, *Orthophosphates.

Surveillance on the Spokane River and its tributaries has shown that a major source of nutrients influent to Long Lake was the effluent of the Spokane sewage treatment plant. Existing concentrations of nitrate nitrogen and orthophosphate increased threefold and tenfold, respectively, below the effluent. Of the influent phosphate, 14% was retained in the reservoir. The major fractions retained were the soluble organic phosphate and orthophosphate. A density current system was evident which altered vertical and longitudinal distribution of physical and chemical parameters. This current isolated a wedge of water on the reservoir bottom and the water became anaerobic. During the period of anaerobiosis orthophosphate phosphorus and nitrate nitrogen maxima are present. Long Lake was classified as eutrophic on a basis of primary productivity, chlorophyll a concentrations, hypolimnetic oxygen depletion, and nitrogen and phosphorus concentrations. Euphotic zone nitrate nitrogen and orthophosphate concentrations correlated negatively with chlorophyll a and phytoplankton standing crops, however the latter correlated positively with temperature. Zooplankton grazing did not significantly limit phytoplankton production.

INFECTION OF AMERICAN SMELT IN LAKE ONTARIO AND LAKE ERIE WITH THE MICROSPORIDIAN PARASITE GLUGEA HERTWIGI (WEISSENBERG),
Saskatchewan Fisheries Lab., Saskatoon.
M. Chen, and G. Power.
Can J Zool. Vol 50, No 9, p 1183-1188, 1972. Illus.
Identifiers: American smelt, *Lake Erie, *Lake Ontario, Glugea-hertwigi, Lakes, Ovary, *Parasites microsporidian, Pathology, Seasonal, *Smelt infection.

In samples taken monthly throughout the year the percentage of American smelt in Lake Ontario and Lake Erie containing cysts of G. hertwigi was 5.2% and 62.7%, respectively. Sexual differences in incidence were observed, the significance of which was uncertain as results from the 2 lakes were contradictory. In male fish infection was almost entirely restricted to the digestive tract with few cysts in the liver, skin, and testes. In female fish the digestive tract and ovaries were similarly infected. Seasonal fluctuations in Glugea infection were obvious and seemed correlated with the gonadal cycle. In both sexes the highest parasite load corresponded with the onset of maturation. A striking difference in fecundity between the 2 smelt populations was attributed to the Glugea infection. In females parasite cysts replaced ovarian tissue, causing a reduction in the number of maturing eggs.--Copyright 1973, Biological Abstracts, Inc.

OVERWINTER DRAWDOWN: IMPACT ON THE AQUATIC VEGETATION IN MURPHY FLOWAGE, WISCONSIN,
Wisconsin Dept. of Natural Resources, Madison. Bureau of Research.
T. D. Beard.
Technical Bulletin No 61, 1973. 13 p, 3 fig, 5 tab, 8 photos, 13 ref.

Descriptors: *Drawdown, *Aquatic weed control, *Wisconsin, Distribution, Water level fluctuations, Pondweeds, Winter, Freezing, Environmental effects, Management, Fish reproduction.
Identifiers: *Murphy Flowage (Wis), Water lily, Water milfoil, Coontail, Water marigold.

After an initial study of the effect of two overwinter drawdowns on aquatic vegetation in Murphy Flowage (Wisconsin), this study determined the reinvasion of certain species into the flowage and various management implications of an overwinter drawdown. There was a drastic change in abundance of aquatic vegetation after the drawdowns. Potamogeton robbinsii, most abundant plant in 1967, covering 104.4 acres was reduced to 8.0 acres in 1968 and 3.1 acres in 1969; Nuphar was reduced from 43.1 acres in 1967 to 10.2 acres in 1969; and Myriophyllum from 19.8 acres in 1967 to 2.9 acres in 1969. The five species most affected by the drawdown showed an approximate acreage reduction after the drawdowns of 187.3 acres. Re-invasion by Najas flexilis, Magalodonta beckii and Potamogeton diversifolius was beginning after the second drawdown. The drawdown released approximately 65 acres for fishing in 1968 and 60 acres were still open by 1969 after the second drawdown. Interference with reproduction due to low water levels was probably the major factor involved in the reduction of aquatic vegetation. Type of vegetation, invasion of resistant species after drawdown, phytoplankton bloom, timing and number of drawdowns, winterkill, fishing pressure and other uses should be given management consideration. (Jones-Wisconsin)

SAPROBIC SUCCESSIONS,
V. Sladecek.
Verhandlungen Internationale Vereinigung Limnologie, Vol 18, Part 2, p 896-902, 1972. 3 fig, 1 tab, 8 ref.

Descriptors: *Biodegradation, *Succession, *Degradation (Decomposition), Eutrophication, Self-purification, Biological communities, Bacteria, Systematics, Protozoa.
Identifiers: Flagellates, Vorticella, Decomposes, Consumers, Producers.

Saprobity is the biological condition of water with respect to amount and intensity of decomposing organic matter, both of autochthonous as well as allochthonous origin. Saprobity develops in two basic directions indicating the successions of characteristic communities. The progressive saprobic sere with the pioneer stage of katharobity develops after receiving nutrients into a betamesosaprobity and is named eutrophication. The input of organic matter increases the saprobity and changes the communities up to hypersaprobity. The regressive sere is self-purification and means the changes of communities in the reverse direction from hypersaprobity to betamesosaprobity. Within the metasaprobity four communities of colorless flagellates can be recognized. All four communities live in havitats with hugh numbers of bacteria including sulphur bacteria which are anaerobic and which show BOD-5 values in the range 700-200 mg/l. Concentration of hydrogen sulfide reaches mg/l up to g/l. Exceptionally few ciliate individuals resistant to hydrogen sulfide appear. Larger numbers of

ciliates mean a transition into the next better saprobic level, the isosaprobity. The rough biocenotical structure of individual saprobic levels is diagrammed. (Jones-Wisconsin)

HETEROTROPHIC GROWTH IN INDOOR RESEARCH CHANNELS: SELF-PURIFICATION AND PRODUCTION,
T. S. Traaen, K. S. Ormerod, and H. Efraimsen.
Verhandlungen Internationale Vereinigung Limnologie, Vol 18, Part 2, p 891-895, 1972. 3 fig, 1 tab, 13 ref.

Descriptors: *Biological communities, *Self-purification, *Productivity, Nutrients, Organic matter, Benthos, Carbon, Phosphates, Nitrates, Ammonia, Carbohydrates, Bacteria, Diatoms, Protozoa, Laboratory tests.
Identifiers: *Sewage fungus, Attached growth, Detached growth, Zoogloeal bacteria, Sphaerotilus natans.

This experiment dealt with quantification of nutrient consumption and organism production in an indoor research channel which received organic matter and inorganic nutrients. Detached growth, that is, growth being released in the effluent stream, was collected by filtering through plankton nets and subsequent filtration through preweighed glass fiber filters. Biochemical changes in the channels were detected by analysis of effluent water. Composition of organisms was not obviously different along the channel thus the self-purification process could not be observed by biological criteria. Chemical analysis, however, demonstrated a definite self-purification. The curves for removal of sucrose and nitrate showed a high degree of conformity, while the removal of ammonia was rather variable. Most of the added orthophosphate was removed after 20 days. Subsequent experiments have demonstrated that increased addition of ortho-phosphate leads to increased removal which means that the self-purification capacity of ortho-phosphate was greater than indicated by the experimental results. The removal of added nutrients was very rapid with considerable amounts of organisms produced. Accordingly, the self-purification as defined by the employed parameters might be understood to express the conversion of one type of pollution to another, with the secondary pollution possibly more troublesome than the original. (Jones-Wisconsin)

BIOLOGICAL TRANSFORMATION OF ORGANIC MATTER IN A RIVER,
T. N Sivko, R. Z. Kovalevskaja, T. M. Mikheeva, and A. P. Ostapenia.
Verhandlungen Internationale Vereinigung Limnologie, Vol 18, Part 2, p 756-760, 1972. 1 fig.

Descriptors: *Energy transfer, *Biological communities, *Organic matter, *Rivers, Phytoplankton, Diatoms, Pyrrophyta, Seasonal, Primary productivity, Sampling, Biomass, Zooplankton, Photosynthesis, Biochemical oxygen demand, Detritus, Respiration, Bacteria, Oxygen, Rotifers.
Identifiers: *Dnieper River (USSR), Mogilyev (USSR), Cyclotella comta, Protococcophyceae, Rhodomonaspusilla, Cryptomonas.

Biological processes in a section of Dnieper River, USSR, from Mogilyev 93 km downstream were studied with limnological methods. Monthly observations at two stations, two series of 72-hour observations with a 4-hour interval and a 48-hour delay to consider current velocity, and single samplings at 11 intermediate stations were made. Phytoplankton, as determined from sediment plankton samples, was mainly represented by diatoms, accounting for 90-95% of total biomass with Cyclotella comta dominant. Higher rate of photosynthesis was found at both stations during second observation series due, apparently, to intensive growth of small size Cyclotella which has a higher photosynthetic activity than large sized cells. About 65% total oxygen was consumed by suspended organic matter, 60% of which was detritus, indicating high metabolic activity of detritic particles and their microflora. If it is assumed algal respiration equals 20% of gross daily photosynthesis, oxygen consumption by algae is about 2 g/sq m oxygen per day, or 40% of its total consumption by water. Zooplankton respiration was represented mainly by rotifers (90% total biomass). The presented values only approximately describe the transformation of organic matter in the river. (Jones-Wisconsin)

THEORETICAL FOUNDATIONS FOR THE STUDY OF PRODUCTIVITY IN AZERBAIJANIAN LAKES AND RESERVOIRS,
A. G. Kasymov, N. F. Likhodeeva, and N. B. Talibov.
Verhandlungen Internationale Vereinigung Limnologie, Vol 18, Part 2, p 863-866, 1972. 2 tab, 4 ref.

Descriptors: *Biological communities, *Productivity, *Lakes, *Reservoirs, Fisheries, Light penetration, Water temperature, Zooplankton, Rotifers, Crustaceans, Copepods, Biomass, Phytoplankton, Benthos, Larvae, Insects, Mollusks, Dragonflies, Tubificids, Fertilization.
Identifiers: *Azerbaijan (USSR), Lake Abjicabul (USSR), Lake Sarisu (USSR), Lake Akgel (USSR), Lake Karagel (USSR), Mingechaur Reservoir (USSR), Varvarinsk Reservoir (USSR).

Of the 64 lakes and reservoirs in Azerbaijan SSR, three lakes and two reservoirs support the fishing industry. Zooplankton productivity, developing in new impoundments, is discussed. At the first stage of biocenotic formation and productivity, historically formed biocenoses are replaced by intensive intrusion into existing biotopes of stagnant water species; formation of new biocenoses on bases of those previously existing is considered a second stage. In reservoirs on transparent rivers new biocenoses productivity is much lower than that of the original river community. In reservoirs on turbid-water rivers, productivity is much higher in comparison with former river biocenoses. Specific composition of newly formed biocenoses bears a temporary character and Chironomid larvae predominate. In the first year of zooplankton complexes Rotatoria are most abundant and are then replaced by Crustacea. In the third stage the existing biocenoses, as well as productivity of plankton and benthos, become stabilized. As a result of mineralization of the flooded land vegetation, Chironomid quantity becomes sharply decreased. Reservoir bottoms are covered with mud and therefore the typical mudloving forms appear instead of species related to submerged plants. To increase productivity land reclamation must proceed and reservoir bays should be fertilized. (Jones-Wisconsin)

EXPERIENCE IN THE STUDY OF BOTTOM ASSOCIATIONS IN THE DNIEPER RIVER RESERVOIRS AND THEIR PRODUCTIVITY,
V. V. Gurvich, K. S. Vladimirova, G. A. Olivary, and U. V. Scorik.
Verhandlugen Internationale Vereinigung Limnologie, Vol 18, Part 2, p 859-862, 1972.

Descriptors: *Ecosystems, *Benthos, *Reservoirs, Biological communities, Depth, Distribution, Cyanophyta, Chlorophyta, Diatoms, Euglenophyta, Environmental gradient, Biomass, Diptera, Mollusks.
Identifiers: *Dnieper River (USSR), Kiev Reservoir (USSR), Kremenchug Reservoir (USSR), Kakhovska Reservoir (USSR), Nnieprodzerzhinsk Reservoir (USSR), Zaporozhje Reservoir (USSR).

Formation and establishment of ecosystems in reservoirs depend on plant and animal composition and on abiotic factors (morphometry of water bodies, physical, chemical and hydrological peculiarities). Estimation of species composition and quantitative development is of primary importance in elucidating cenosis structure and functions. Formation of bottom cenoses in Dnieper reservoirs begins soon after impoundment. Algae and protozoa are pioneers, insect larvae, mysids, molluscs and other organisms follow. A cenosis is formed during the first 3-4 years. In summer and autumn, more than 50% of biomass weight are algae, mainly Bacillariophyta and Chlorophyta. Animals of these cenoses include Oligochaeta, chironomid larvae, and crustaceans. In spite of the high biomass of bottom cenosis its distribution in the photic zone is irregular. Average biomass of micro- and mesobenthic organisms is four times lower than that of macrobenthos biomass and is considerably lower than phytomicrobenthos. Reservoir deep areas are characterized by a restricted number of cenoses, regardless of reservoir age and location. Analysis of bottom cenoses of Dnieper reservoirs shows a great algal diversity and high biomass compared with that of animals. The greater the number of green algae, diatoms and euglenoids, the richer is the zoobenthos. (Jones-Wisconsin)

SOME BIOLOGICAL PECULIARITIES IN RESERVOIRS IN SOUTH TURKMENIA,
Sh. I. Kogan.
Verhandlungen Internationale Vereinigung Limnologie, Vol 18, Part 2, p 867-871, 1972. 2 fig, 3 tab, 10 ref.

Descriptors: *Productivity, *Biological communities, *Reservoirs, Arid climates, Solar radiation, Oligotrophy, Hydrobiology, Limiting factors, Phytoplankton, Aquatic plants, Hydrology, Chemical properties, Nitrogen, Phosphorus, Biomass, Turbidity, Water level fluctuations.
Identifiers: *Turkmenia (USSR), Macrophytes.

A number of reservoirs in the Turkmen Republic (USSR) are built for irrigation. In an arid country with high direct solar radiation, they are characterized by low biological production. Some hydrological and hydrochemical data accounting for low productivity of zooplankton, phytoplankton, benthos and fish are discussed. Effect of water transparency and water level variations on phytoplankton development is seen in Kurtli Reservoir of the Kara-Kum channel. Nitrogen and phosphorus contents are very low and the reservoirs are thus considered oligotrophic. The low primary phytoplankton production with high macrophyte production is regarded as one of the typical biological peculiarities of South Turkmenian reservoirs. There are no species of phytoplankton algae in these reservoirs which are significant in moderate latitudes, such as Anabaena flos-aquae, Anabaena lemmermannii, Aphanizomenon flos-aquae and other representatives of blue-green algae. There are, however, some definitely tropical blue-green species and a relatively large number of these are capable of atmospheric nitrogen fixation. Some reservoirs, Keiif, Kurtli, Third Guindukush, are considered eutrophic though they differ considerably from typical eutrophic reservoirs in the European part of the USSR. (Jones-Wisconsin)

SEASONAL CHANGES IN WATER CHEMISTRY OF A TROPICAL LAKE (LAGO DO CASTANHO, AMAZONIA, SOUTH AMERICA),
G. W. Schmidt.
Verhandlungen Internationale Vereinigung Limnologie, Vol 18, Part 2, p. 613-621, 1972. 7 fig., 2 tab., 10 ref.

Descriptors: *Tropical regions, *Seasonal, *Water chemistry, Lakes, *South America, Water level

fluctuations, Rainfall, Conductivity, Calcium, Bicarbonates, Chlorides, Silica, Phosphorus, Iron, Oxygen, Sodium, Potassium.
Identifiers: *Lago do Castanho (Brazil), Amazon (South America).

Seasonal water level fluctuations of the Amazon River exercise a controlling influence over its flood plain and produce seasonal differences in many physical-chemical and biological conditions in the numerous lakes of this landscape. The chemistry of Lago do Castanho, whose depth depends on the water level of the Amazon, was studied by standard hydrochemical laboratory methods. Toward the end of October or beginning of November, the river usually begins to rise and back up into the lake basin, where the load of suspended materials is deposited on the lake's floor. As the water level in the river continues to rise, the lake continues to fill until about the middle of June, stagnates briefly, then begins to empty as the river level falls. During the water's sojourn within the basin, its salt content, and, therefore, its electrical conductivity, decreases considerably. Highest values of total iron and total phosphorus for the year were reached before the water dropped to its minimum level. It was determined that chemical conditions in the Lago do Castanho undergo a pronounced yearly cycle, which is ultimately the sole result of water level changes of the Amazon, thus reflecting the rainfall regime over the entire catchment area of this river system. (Jones-Wisconsin)
W73-13731

A PRELIMINARY COMPARISON OF THE ZOOPLANKTON IN A TROPICAL AND A TEMPERATE LAKE (LAKE GEORGE, UGANDA AND LOCH LEVAN, SCOTLAND),
M. J. Burgis, and A. F. Walker.
Verhandlungen Internationale Vereinigung Limnologie, Vol 18, Part 2, p. 647-655, 1972. 5 fig., 12 ref.

Descriptors: *Zooplankton, *Tropical regions, *Temperate, *Life history studies, Lakes, Physical properties, Copepods, Dominant organisms, Seasonal, Reproduction, Eutrophication, Population, Standing crops, Biomass, Daphnia.
Identifiers: *Lake George (Uganda), *Loch Leven (Scotland), Cyclops strenuus abyssorum, Thermocyclops hyalinus, Mesocyclops leuckarti, Daphnia barbata.

The major physical parameters of a tropical lake and a temperate lake are described for comparison of their zooplankton. Both lakes contain dense phytoplankton populations. Blue-green algae, particularly Microcystis spp. are dominant throughout the year, and the mean concentration of chlorophyll-a shows relatively little variation in Lake George. In Loch Leven blue-green algae are frequently abundant and chlorophyll concentrations are highest in April and May, but the species composition of the population shows no regular pattern of seasonal variation or succession. Submerged aquatic macrophytes are sparse in both lakes. The zooplankton in both lakes is dominated by a species of cyclopoid copepod. In Loch Leven Cyclops strenuus abyssorum contributes 99% to the total crustacean zooplankton numbers. In Lake George Thermocyclops hyalinus accounts for 80 to 96% and Mesocyclops most of the remainder. This comparison of the zooplankton is confined to the two dominant copepods. Their mean standing crop, seasonal variation in numbers of the major divisions in their life histories and some relevant comparisons of reproduction are presented. Filter-feeders are relatively insignificant. (Jones-Wisconsin)
W73-13732

PLANKTON COMPOSITION IN RELATION TO NUTRIENT INFLOW IN A SMALL NEW ZEALAND LAKE,
V. M. Stout.
Verhandlungen Internationale Vereinigung Limnologie, Vol 18, Part 2, p. 605-612, 1972. 5 fig., 1 tab, 3 ref.

Descriptors: *Physicochemical properties, *Plankton, *Nutrients, *Inflow, Springs, Lakes, Agricultural runoff, Swamps, Streams, Silica, Phosphorus, Nitrogen, Water temperature, Diatoms, Chlorophyll, Dominant organisms, Seasonal, Chlorophyta, Light intensity, Rotifers, Crustaceans.
Identifiers: *Lake Grasmere (New Zealand), Diatoma.

Major inlets to Lake Grasmere, New Zealand, are compared physically and chemically. Temperatures, fluctuations in silica, total phosphorus and total organic nitrogen in the lake, secchi disc readings, chlorophyll-a and comparative fluctuations in dominant phytoplankton species are described. There are three periods of more abundant phytoplankton growth: a winter peak of Diatoma, a spring growth mainly of green algae, and a summer peak of three different species of diatoms. The zooplankton in Lake Grasmere in winter consist almost entirely of rotifers, and these increase in numbers in the spring. Thus, there is a seasonal succession in the zooplankton with rotifers dominant from late autumn until spring and Cladocera abundant over the warmer months. Fluctuations in the levels of the important nutrients, such as silica, phosphorus and nitrogen, in the inlet waters may cause variations in plankton composition, both in kinds of species present and in the total amount of plankton. Besides those investigated, there may also be an important contribution of other nutrients, such as trace elements. The amounts of nutrients in the inlet waters will vary from year to year and may cause corresponding changes in plankton succession. (Jones-Wisconsin)

BIOASSAY AND CHEMICAL COMPOSITION OF SOME CARPATHIAN RIVERS,
Polish Academy of Sciences, Krakow. Zaklad Biologii Wod.
M. Bombowna, and H. Bucka.
Verhandlungen Internationale Vereinigung Limnologie, Vol 18, p 735-741, 1972. 2 fig., 3 tab., 4 ref.

Descriptors: *Bioassay, *Chemical analysis, *Rivers, *Productivity, Eutrophication, Analytical techniques, Algae, Reservoirs, Biological communities, Forecasting, Indicators, Nutrients, Calcium, Magnesium, Photosynthesis, Systematics, Limiting factors, Scenedesmus, Diatoms.
Identifiers: *Poland (Carpathian rivers), Upper Wisla (Poland), Goczalkowice Reservoir (Poland), Skawa River (Poland), Raba River (Poland), Dunajec River (Poland), Ankistrodesmus pseudomirabilis, Scenedesmus acutus, Fragilaria capucina.

Potential productivity of Carpathian rivers, Upper Wisla above its influx into Goczalkowice Reservoir and its three right affluents, Skawa, Raba and Dunajec was measured. Whether the high content of nutrient compounds, a higher calcium and magnesium content are good indicators of larger potential river productivity at the given moment was checked. A chemical analysis of the water was made and the amount of the given test organisms, as well as the intensity of their photosynthesis was estimated. Attention was paid to elimination of nutrient compounds, alteration of pH value, amount of algal suspension precipitated on the membrane filters dried at 40C, and chlorophyll content. Accurate measurements of photosynthetic intensity in all the tests were made, and supplemented by the determination of primary production. Possible decreases of nutrient compounds in future dam reservoirs can be examined on the margin of bioassays characterizing the potential river productivity. The comparison of the rivers shows that rivers with a similar chemical composition may have different influence on algal growth. Therefore the chemical analysis completed by the algal test and microrespirometric methods seems the most useful in river investigations. (Jones-Wisconsin)
W73-13734

CORRELATION BETWEEN DISSOLVED OXYGEN AND PHYTOPLANKTON IN THE LOWER REACHES OF VOLTA LAKE, GHANA,
S. Biswas.
Verhandlungen Internationale Vereinigung Limnologie, Vol 18, Part 2, p. 622-627, 1972. 3 fig., 5 tab, 10 ref.

Descriptors: *Correlation analysis, *Dissolved oxygen, *Phytoplankton, *Africa, Photosynthesis, Density, Mathematical studies, Distribution, Variability.
Identifiers: *Volta Lake (Ghana).

In deep lakes the photosynthetic oxygen release is usually due to phytoplankton. Though significant correlation between oxygen and phytoplankton may be observed as expected, it is not necessarily a certainty. Observations on the lower reaches of Volta Lake, Ghana, have shown that significant correlations may or may not be obtained according to the way data are expressed. Vertical distribution of dissolved oxygen and phytoplankton was recorded weekly offshore over a year. Oxygen was determined iodometrically and expressed as percentage saturation. Both living and dead phytoplankton organisms were counted, the distinction being based on the presence or absence of healthy cell contents. Data were expressed both as living organism density and their percentage in a total of living and dead. Expected correlation between oxygen and phytoplankton was supported by actual observations. The partial correlation coefficients were significant when depth was eliminated and hence the observed correlation was not a spurious one. It was also practically linear as data closely approximated the fitted line of regression. Percentage of living phytoplankton but not its density correlated significantly with dissolved oxygen. Data show that a high density does not necessarily mean a high proportion of photosynthetically active organisms. (Jones-Wisconsin)

NEW PARASITE RECORDS FOR LAKE ERIE FISH,
Department of Lands and Forests, Maple (Ontario). Research Branch.
A.O. Dechtiar.
Great Lakes Fish Comm Tech Rep. 17 p 1-20. 1972.
Identifiers: Lake Erie, Acanthocephala, Aspidocotylea, Cestoda, Crustacea, Digenea, Fish, Hirudinea, Lakes, Mollusca, Monogenea, Nematoda, *Parasites, Protozoa, Virus.

During 1961-1969 inclusive, 1112 fish representing 46 spp., were examined for parasites. Fish were taken mainly from the Port Dover areas in the eastern end, and from the Wheatley area in the western end of Lake Erie. Of the fish, 96% were infected by a least 1 sp of parasite. This study adds 96 new records, including several new spp., to the parasite fauna of Lake Erie fish, bringing the present known total to 215 spp. The parasites included a virus, Protozoa, Monogenea, Aspidocotylea, Digenea, Cestoda, Nematoda, Acanthocyphala, Hirudinea, Crustacea and Mollusca.--Copyright 1973, Biological Abstracts, Inc.

EVALUATION OF ECOLOGICAL EFFECTS OF RECENT LOW WATER LEVELS IN THE PEACE-ATHABASCA DELTA,
H. J. Dirschl.
Can Wildl Serv Occas Pap. 13. p 3-28. 1972. Illus.
Identifiers: Calamagrostis-Spp, *Canada (Peace-Athabasca delta), Deltas, *Ecological effects, Fen, Herbaceous, Peace River, Phragmites-Communia, Vegetation, *Water levels, Willow.

Concern about the ecological effects of the altered water regime of the Peace-Athabasca Delta, following completion of the W. A. C. Bennett Dam on the Peace River, led the Canadian Wildlife Service in 1968 to initiate an ecological study. A preliminary account is presented of study of plant succession on exposed silt surfaces. Techniques are discussed which were used to (1) classify and map the delta's landscape according to homogeneous units and (2) examine the distribution of those landscape units in relation to topography and moisture regime. The ecological character of the Peace-Athabasca Delta is determined by the flat terrain and the unique hydrological regime formed by the lower Peace River, and by Lake Athabasca and its outflow channels. Vegetation pattern and animal life in the delta have developed in response to a fluctuating water regime and thus are adapted to it. The germination of seeds contained within the silt or distributed by wind has resulted in rapid colonization of the exposed lake bottoms by numerous species of herbaceous fen vegetation and by willow seedlings. If the present water regime continues indefinitely, the observed plant succession will convert most of the exposed lake and marsh bottoms into willow or phragmites (Phragmites communis) thickets and reedgrass (Calamagrostis spp.) meadows. The overall effect of the regulated water regime on the landscape of the Peace-Athabasca Delta appears to represent an acceleration in the natural aging rate of the delta deposits. It will include a simplification of the delta's scenic diversity, a pronounced reduction in the number and extent of water bodies and a diminution of productive shallow marsh and wet meadow environments in proportion to mesic shrub and forest communities.--Copyright 1973, Biological Abstracts, Inc.

SOME EFFECTS OF MYSID INTRODUCTION AND NUTRIENT ENRICHMENT ON A LARGE OLIGOTROPHIC LAKE AND ITS SALMONIDS,
T. G. Northcote.
Verhandlugen Internationale Vereinigung Limnologie, Vol 18, Part 2, p 1096-1106, 1972. 3 fig, 3 tab, 14 ref.

Descriptors: *Eutrophication, Fish management, *Salmonids, *Crustaceans, Phosphates, Fish food organisms, Fisheries, Fish harvest, Zooplankton, Daphnia, Copepods, *Canada, *Oligotrophy, Lakes.
Identifiers: *Kootenay Lake (British Columbia).

Shortly after experimental introduction of mysids into Kootenay Lake, British Columbia, the lake was subjected to heavy nutrient enrichment. The impacts of these events are reviewed, and, where possible, the effect of mysid introduction and nutrient enrichment are distinguished. Evidence is presented strongly indicating an accelerated eutrophication of Kootenay Lake within the recent two decades. Although the introduced population of Mysis relicta rapidly expanded and dispersed throughout the lake during this same period, there seems little likelihood of its involvement in the many changes indicative of eutrophication, except perhaps for some shifts in relative abundance of zooplankton species. Many of the recent limnological changes in the lake probably result from the sharp increase in its nutrient loading, of which phosphates are predominant. Of the three common salmonids in Kootenay Lake, two species, rainbow trout and kokanee, have apparently responded to one or both major changes in the system, the kokanee very obviously so. Although it has not been possible to distinguish clearly the effects of mysid introduction and nutrient enrichment upon Kootenay Lake and its salmonids evidently the latter has not all been deleterious. (Jones-Wisconsin)

BIOGENIC ENRICHMENT OF SOCKEYE SALMON LAKES AND STOCK PRODUCTIVITY,
Washington Univ., Seattle. Coll., of Fisheries.
O. A. Mathisen.
Verhandlungen Internationale Vereinigung Limnologie, Vol 18, Part 2, p 1089-1095, 1972. 5 fig, 8 tab.

Descriptors: *Fisheries, *Sockeye salmon, *Productivity, *Spawning, *Alaska, Food chains, Predation, Fish harvest, Competition, Fish food organisms, Lakes.
Identifiers: Nushagak District (Alaska).

Diminution of the sockeye salmon runs in Nushagak District, Alaska, is ascribable to several density-dependent factors, because escapement levels computed from historical records were remarkably stable during the last 60 years of commercial fishing operations, while yields were declining. It is increasingly clear that the function of the escapement, in addition to providing eggs, also affects survival in fresh water of the progeny in different ways. Reduced escapements may change freshwater survival rate by altering either food productivity or the biotic predator community and food competitors of physical characteristics of the spawning beds or by an interaction of all. Eventually a lake system must stabilize itself on a lower productivity level, a mechanism which could explain decline of the early average catches. Presumably yields of the magnitude obtained during the peak of the Nushagak fishery could not be sustained without artificial fertilization. Once the effect of biogenic fertilization was reduced, factors like predation will exert more direct control of freshwater survival. A spawner-recruit relationship contained in a simulation model must be based not on fixed parameters, but on parameters expressed as functions of changing productivity. (Jones-Wisconsin)

THE CYCLING OF RADIOACTIVE SEDIMENTS (STRONTIUM-90) IN THE LAKES OF LATVIAN SSR,
G. Andrushaitis, and Z. Kalnina.
Verhandlungen Internationale Vereinigung Limnologie, Vol 18, Part 2, p 995-1000, 1972. 1 tab, 9 ref.

Descriptors: *Radioactive wastes, *Migration, Sediments, Biological communities, *Strontium radioisotopes, Lakes, Trophic level, Adsorption, Seasonal, Calcium, Plankton, Aquatic plants, Fish, Crustaceans, Copepods, Rotifers, Phytoplankton, Invertebrates, *Lake sediments.
Identifiers: *Latvian SSR.

Concentrations of strontium-90 in water and its uptake by plankton, plants, fish, substrates, and the calcium content of the water were measured in Latvian reservoirs of different trophic states to determine the accumulation and migration of radioactive wastes. Analyses of Sr-90 show that fish--Esox lucius, Perca fluviatilis, Abramis brama--accumulate more Sr-90 in a dystrophic lake than the same species in mesotrophic and eutrophic lakes. In considering different lake types, there was a marked difference between the Sr-90 concentration factor in a dystrophic and that of either eutrophic or mesotrophic lakes. Concentration factor for plankton, water plants, fish and substrates in a dystrophic lake is higher than in mesotrophic and eutrophic lakes, corresponding to their different ionic relationships. Sr-90 concentration in water and its accumulation by hydrobionts and lake substrates changes seasonally. In water it is highest during autumn and winter, lowest during summer. Sr-90 increases during plant vegetation period due to mineral increase. For fish it is higher in spring than autumn. Its increasing or decreasing concentration factor for plankton is connected with change in species and water pH, but for substrates it depends on substrate structure and its displacement. (Jones-Wisconsin)
W73-13778

ON THE USE OF MATERIAL BALANCES FOR THE ASSESSMENT OF SELF-PURIFICATION CAPACITY IN INLAND WATERS, LAKE PAIJANNE AS AN EXAMPLE,
K. M. Lappalainen
Verhandlungen Internationale Vereinigung Limnologie, Vol 18, Part 2, p 934-941, 1972. 5 fig, 1 tab, 11 ref

Descriptors: *Self-purification, *Lakes, *Eutrophication, *Mathematical models, Phosphorus, Lignins, Nutrients, Iron, Primary productivity, Phytoplankton, Biomass, Humus, Organic matter, Sedimentation, Nitrogen
Identifiers: *Finland (Lake Paijanne), Material balance.

Some points in formation of a numerical model of self-purification are presented. The material balance investigation of Lake Paijanne, Finland, was started in 1970 to determine the material discharge in different inlets and outlets and at some of the lake's cross-sections. In one upper waterway the influences of two pulp mills and three housing areas are evident in the lignin and phosphorus content; human effluents from Jyvaskyla are shown by a high amount of nutrients. Central Paijanne receives waste from a pulp mill and two housing areas. There seems to be a positive correlation between the sedimentation of P and the Fe content, but the role iron plays in the sedimentary process of phosphorus is not understood. Positive correlation between sedimentation and average amount of primary production and biomass of phytoplankton are shown. Oxygen saturation of the hypolimnion as the sedimentation function at different points of the open lake at the summer's end is given. If the material balance observations and observations of the lake condition are drawn from a sufficient number of lakes, different cases can be fitted into certain classes and within each class a quantitative model for self-purifying function can be formed. (Jones-Wisconsin)

ECOLOGICAL EFFECTS OF STRIP MINING IN OHIO,
Bendix Aerospace Systems Div., Ann Arbor, Mich.
P. Chase.
Available from the National Technical Information Service as E73-10003, $3.00 in paper copy, $1.45 in microfiche. NASA/Goddard Space Flight Center PR 569, SR 309, Bimonthly progress report, January 1973. 3 p. NAS 5-21762.

Descriptors: *Mapping, *Strip mines, *Ohio, Ecology, Terrain analysis, Coal mines, Surveys, Water quality, Monitoring, Reclamation, Appalachian Mountain Region, Satellites (Artificial), *Environmental effects.
Identifiers: Coal deposits.

Monitoring is conducted of the acreage stripped or otherwise disturbed by coal mining operations in southern and eastern Ohio to detect, identify, and map the secondary effects of coal mining (STRIP) on the environment. These include erosion, vegetative stress, and sedimentation in rivers and lakes. The effects of water drainage and mine acid seepage are also of interest. The after-effects of mining operations are to be studied and recovery time and effectiveness with which mined areas are restored to usefulness compared. The stripped areas are easily monitored by ERTS-1. From

ocessing of the CCT's, various stages of recla-
ation may be recognized. One result, significant
a practical application and for cost-benefit anal-
is, is the relative ease with which ERTS-1 will
onitor new and unreclaimed stripping activities
southeastern Ohio and in all of Appalachia. The
dth of new or unreclaimed stripped areas are
ted by band numbers. The shape is quite distinc-
e on the bands and monitoring additional areas
Appalachia without other graphic aids appears
ssible for a trained photo interpreter. (Jones-
isconsin)

EFFECTS OF SPOIL DUMPING ON THE BENTHIC INVERTEBRATES OF THE SOUND,
Rhode Island Univ., Kingston.
S. D. Pratt.
n: Dredge and Spoil Disposal in Rhode Island
Sound, University of Rhode Island Sea Grant
Marine Technical Report No 2, 1972. p 31-42, 2 fig,
tab.

Descriptors: *Dredging, *Environmental effects,
Benthic fauna, Invertebrates, Speciation, Sand,
Silt.
dentifiers: *Rhode Island Sound, *Providence
Harbor (R.I.), *Spoil dumping.

The communities of benthic organisms in the
Rhode Island Sound and Providence Harbor are
studied and the effects of spoil dumping on them is
reviewed. Samples were taken and analyzed of the
faunal assemblages in the spoil area, they had
characteristic diversity index values that could not
be simply interpreted. Some spoil samples had
relatively high values, indicating little disturbance,
while the natural assemblage had extremely low
values. Only a few species were found on the spoil
dump which had been transported from the dredge
area, and only one species in abundant numbers.
Most of the species colonizing the spoil were
members of the surrounding sand-bottom assem-
blage. Although the spoil was generally silty, only
a few colonizing species were recognized as mem-
bers of the offshore silt-bottom assemblage. Am-
petisca agassizi, a tube building amphipod
crustacean that is the dominant species on the
sandy sediments in the dump area was found on
some spoil areas indicating that colonization will
occur when the hydrographic regime is suitable,
independent of the quality of the underlaying sedi-
ment. (See also W73-09142) (Ensign-PAI)
W73-13783

FISHERIES RESOURCES IN THE DUMP SITE AREA,
Rhode Island Univ., Kingston.
S. D. Pratt.
In: Dredge Spoil Disposal in Rhode Island Sound, University of Rhode Island Sea Grant Marine Technical Report No 2, 1972. p 43-45, 2 fig. URI CONTRACT 98-20-6012.

Descriptors: *Dredging, Fishing, *Fisheries, *Fish conservation, Lobsters, Fish.
Identifiers: *Rhode Island Sound, Spoil dumping, Fin fish, Cod, Flounder, Butterfish, Scup.

The types of fisheries in the Rhode Island dump site area and the extent to which each was affected by the spoil dumping was determined. Fin fish, cod, flounder, butterfish and scup are caught by trawling. The major concerns of trawl fishermen were that spoil might be dumped outside the designated area and that it might increase turbidity after storms, reducing fish catches. Lobstermen avoid trapping near the dump site fearing low polluted catches, burial of traps and loss of buoys. Lobster was the least affected fishery and will probably continue on the spoil after dumping ceases. (See also W73-09142) (Ensign-PAI)

THE EXTINCTION OF FISH AND ACID WATER,
Oslo Univ. (Norway). Dept. of Limnology.
A. Lande.
Fauna (Oslo), Vol 25, No 2, p 105-110, 1972, Illus, English summary.
Identifiers: *Acid water, Extinction, Fish, *Norway, *Trout, Water analysis.

During the later decades, and especially during the period 1960-65, the trout has become extinct in many lakes and rivers in southern Norway. The increased acidity of precipitation is certainly the main cause. The situation in Bygland, about 100 km north of Kristiansand is described. Some water samples were taken from different lakes and rivers in this area in Oct. 1970 and Oct. 1971. Analyses of pH, conductivity and ionic composition were carried out. The water is very poor in electrolytes, and very often it is the low pH, and not Ca or total ionic concentration that determines the conductivity. It seems that bog lakes, or seepage lakes have less variation in pH than lakes with large amounts of water flowing through, and in such seepage lakes the trout populations can survive.--Copyright 1973, Biological Abstracts, Inc.

WATER NITRATE METHEMOGLOBINEMIA IN CHILDREN AND ADOLESCENTS (IN RUSSIAN),
Kazanskii Gosudarstvennyi Meditsinskii Institut (USSR). Faculty of Pediatrics.
N. I. Petukhov, A. I. Ryvkin, G. G. Gainullin, and V. I. Landysheva.
Gig Sanit, Vol 37, No 3, p 14-18, 1972, English summary.
Identifiers: Adolescents, Blood, Children, Cyanosis, *Nitrates, Pressure, *Well water, *Methemoglobinemia, Public health.

The nitrate content of well water was studied in 3 settlements, as were its effects on the health of 453 persons, aged 6 mo. to 75 yr. When the concentration of nitrates in the water was 23.7-44.6 mg/l (N), water-nitrate methemoglobinemia developed in children and adults, Cyanosis, a fall of the minimal and maximal blood pressure and an increase of methemoglobin content of blood were noted in all sick persons. A rise of 000 pulse rate was noted in children under 6 yr, and an increase of the respiration rate in children under 13 years of age.--Copyright 1973, Biological Abstracts, Inc.

CONTRIBUTIONS TO THE RECOGNIZING OF INFECTIOUS AND PARASITIC DISEASES OF FISHES LIVING IN THE MODERATE BRACKISH WATERS OF ROMANIA (IN RUMANIAN),
Institutul de Cercetari si Proiectari Alimont, Bucharest (Rumania).
R. Georgescu, N. Angelescu, and R. Tilenschi.
Stud Cercet Piscic Inst Cercet Proiect Aliment. 4. p 349-361, 1971, English summary.
Identifiers: *Brackish water, Diseases, Fish infections, *Parasitic diseases (Fish), *Romania.

The fish used for stocking the moderately brackish ponds of the Amara fish farm came from fresh water ecosystems, which are centers of contagious diseases and have a rich and varied parasitic fauna. The evolution of infectious and parasitic diseases in the new environment was studied in 1970. Both kinds of diseases continued to develop. Only 16 species of parasites, with an ectoparasites:endoparasites ratio of 7:9, were found. Earlier studies found 33 species with ectoparasites:endoparasites ± 19:14.--Copyright 1973, Biological Abstracts, Inc.

EFFECT OF WASTE DISCHARGES INTO A SILT-LADEN ESTUARY, A CASE STUDY OF COOK INLET, ALASKA,
Alaska Univ., College. Inst. of Water Resources.
R. S. Murphy, R. F. Carlson, D. Nyquist, and R. Britch.

Available from the National Technical Information Service as PB-223 009, $3.00 in paper copy, $1.45 in microfiche. Completion Report IWR-26, November, 1972. 26 p, 13 fig, 3 tab. OWRR B-015-ALAS (2).

Descriptors: *Waste assimilative capacity, Waste water treatment, Water pollution effects, *Estuaries, Municipal wastes, *Nutrients, *Alaska, Cold regions, Outlets.
Identifiers: *Cook Inlet (Alas), Low temperature effects.

Cook Inlet, Alaska, located adjacent to Anchorage, Alaska's largest population center has received the area's raw waste discharges for five decades. A program of field measurements and data analysis was carried out to examine the effects of the raw discharge on the Inlet's low temperature, silt laden, highly mixed waters. The physical characteristics studied included temperature, suspended sediments, tidal currents and tidal dispersion. Chemical characteristics included measurements of pH, dissolved oxygen, salinity and nutrients such as silica, nitrogen and phosphorus. The biological characteristics studied were bacteria, plankton and benthic organisms. The study indicated that some pollution had occurred near the outfalls but the Inlet as a whole was extremely low in all usual pollution indicators. Because of the high tidal mixing and heavy sediment concentrations the Inlet water present a very hostile environment and could easily receive additional waste loads with no detrimental effects. Additional treatment of the now primary treated water is unnecessary.

PESTICIDE LEVELS IN WATER AND WILDLIFE OF REELFOOT LAKE, TENNESSEE,
Tennessee Univ., Martin. Dept. of Biological Sciences.
J. W. Henson.
Available from the National Technical Information Service as PB-223 013, $2.75 in paper copy, $1.45 in microfiche. Tennesse Water Resources Research Center, Knoxville, Research Report No 34, 1973. 19 p, 1 fig, 4 tab, 13 ref.

Descriptors: *Pesticide residues, *DDT, Lakes, *Fish, *Wildlife, *Mortality, Water pollution effects, Environmental effects, *Tennessee.
Identifiers: *Reelfoot Lake (Tenn.).

An attempt was made to determine the extent of pollution of waters and fish of Reelfoot Lake (Tenn.) by chlorinated pesticide residues and to determine whether residue accumulation in the tissues of lake-associated animals was a factor in their mortality. Except in winter, water samples from the highly eutrophic lake contained large amounts of organics and/or soil particulate matter which interfered with the analytical methods used. The presence of DDT and its derivative was indicated in low concentrations (up to 15-20 ppt) in those water samples collected during winter months. All fish samples (collected 1971-1973) contained p,p'-DDT and its derivatives at levels ranging from 0.017-49.312 ppm (whole fish, wet-weight basis), but all residue levels were less than 5 ppm except for one channel catfish taken near the mouth of a stream that enters the lake. Aldrin and dieldrin also were found in the tissues of this channel catfish. Mortaility of resident mallard ducks was not determined to be due to pesticide residue accumulation although p,p'-DDE (0.049-0.492) was found in all duck tissues.

FURTHER OBSERVATIONS ON A GROWTH INHIBITING SUBSTANCE PRODUCED BY PANDORINA MORUM,
Kentucky Univ., Lexington. Dept. of Botany.
D. O. Harris.
Research Report (1972). 20 p, 5 tab, 12 ref. OWRR A-018-KY (3).

Descriptors: *Algal toxins, *Inhibitors, *Plant growth, Stability, Enzymes, Photosynthesis, Respiration, Hydrogen ion concentration, Solubility, Algal control.
Identifiers: *Pandorina morum, Volvocaceae, Volvox tertius, Volvox globator, Volvulina pringsheimii.

These studies clearly show that a substance produced by Pandorina morum (a colonial green flagellate) inhibits growth of most members of the Volvocaceae. The substance was relatively stable when exposed to acid, although exposure to a pH of 2.0 for 20 minutes did destroy most of its activity. It was soluble in benzene and chloroform. To gain some insight concerning the possibility that the toxin was proteinaceous, effects of several proteolytic enzymes on the toxin were examined; these enzymes were trypsin, chymotrypsin and pronase. All attempts to degrade or destroy the inhibitor with these common proteolytic enzymes proved to be unsuccessful, which suggests that the substance is not proteinaceous in structure. A critical examination of the molecular size was undertaken using Sephadex gel filtration. The effect of the inhibitor on the rates of both photosynthesis and respiration was measured. A 65% reduction in photosynthetic rate was found, but, in general, respiration rates were unaffected. It is hoped that these studies on the toxin will shed light on a method to control the indiscriminate growth of algae in all water supplies. (Jones-Wisconsin)
W73-13900

THE INFLUENCE OF SIMAZINE ON THE PHOTOSYNTHETIC PIGMENTS OF GREEN ALGAE,
L. N. Paromenskeya, and G. N. Lyalin.
Available from the National Technical Information Service as AD-754 220. Defence Research Information Centre, Translation No. 2992, November 1972. 8 p, 3 fig, 2 tab, 17 ref. Translated from Fiziologiya Rastenii, Vol 15, No 6, p 1002-1007, 1968.

Descriptors: *Triazine pesticides, *Photosynthesis, *Plant pigments, *Chlorophyta, Chlorophyll, Herbicides, Chlorella, Biochemistry.
Identifiers: *Simazine, Carotin, Lutein, Violaxanthin, Chlorella vulgaris, Ankistrodesmus braunii, Chlorosarcina.

The main link in the herbicidal actions of triazines is disturbance of photosynthesis, requiring research into the effect of triazine herbicides on pigments. The amount of chlorophylls a and b, carotin, lutein and violaxanthin and the chlorophyll luminescence spectra were determined after incubation for 2, 7 and 17 days of green algae in a medium either containing or not containing simazine. In cells of the herbicide-sensitive species Chlorella vulgaris and Ankistrodesmus braunii, pigment content, particularly that of lutein, carotin and chlorophyll-a, decreased. In algal suspension on the basis of measurement of chlorophyll luminescence spectra, it was deduced that the observable decrease of chlorophyll with sensitive algae is not directly linked to interaction of the pigment with simazine. In the resistant species' cells (Chlorosarcina), such an interaction takes place by the second day, apparently one reason for detoxication of simazine. It is possible that with triazine herbicides in cells of resistant algae (Chlorosarcina) a combination of simazine with the chlorophyll-albuminous complex takes place. Comparison of luminescence spectra of suspensions of C. vulgaris and Chlorosarcina showed presence of different chlorophyll forms, possibly one reason for high sensitivity of C. vulgaris towards the herbicide. (Jones-Wisconsin)

LEVELS OF CHLORINATED HYDROCARBON IN CATFISH IN ALABAMA, ARKANSAS, FLORIDA, GEORGIA, LOUISIANA AND MISSISSIPPI.
Mississippi State Univ., State College. Dept. of Biochemistry, Mississippi State Univ., State College. Dept. of Entomology, and Mississippi State Univ., State College. Dept. of Zoology.

Available from the National Technical Information Service as COM-72 10669. Dept. of Commerce, Economic Development Administration, Technical Assistance Project Report, April 1972. 44 p, 3 fig, 8 tab, 11 ref, 3 append. DOC 14-17-0002-512.

Descriptors: *Pesticide residues, *Chlorinated hydrocarbon pesticides, *Catfishes, *Southeast U.S., Alabama, Arkansas, Florida, Georgia, Louisiana, Mississippi, Monitoring, Analytical techniques, Adsorption, Fish farming, DDT, Tennessee River, Mississippi River, Fish physiology, DDE, DDD, Dieldrin.
Identifiers: Mirex, Toxaphene.

Pesticide residues in commercial catfish in Southeastern United States were monitored and uptake (food and water), tissue distribution, and elimination of selected chlorinated hydrocarbons by channel catfish determined. Virtually every sample contained p,p'-DDE. Its parent compound, p,p'-DDT, appeared in all muscle samples and in 93% of the liver samples. In laboratory studies, catfish were treated in low concentrations of DDT, Mirex or toxaphene in water; water was sampled at 0, 1, 3, and 6 weeks and fish at 1, 3, and 6 weeks to determine pesticide concentration. DDT, Mirex, and toxaphene were dissolved in sufficient hexane to insure complete penetration of commercial catfish food pellets to determine the catfish uptake and release of the insecticides through food. Of tissues assayed, pesticide residues were consistently lower in muscle than in other tissues regardless of route or length of exposure. Highest residue levels were in blood and brain. In water, Mirex was distributed to and retained in muscle to a much lesser extent than was toxaphene and DDT. In all instances, exposure through food resulted in higher residue levels. Biological magnification in the food web represents a more serious threat than residues in water. (Jones-Wisconsin)

NUTRIENT INPUTS AND THEIR RELATIONSHIP TO ACCELERATED EUTROPHICATION IN LAKE MICHIGAN,
Michigan Univ., Ann Arbor. Great Lakes Research Div.
C. L. Schelske.
Available from the National Technical Information Service as CONF-710735-1. Contribution No 151, July 1971. 23 p, 6 fig, 4 tab, 35 ref. Presented at Third International Symposium for Hydrology Professors, Purdue University, Lafayette, Indiana. AEC COO-2003-15.

Descriptors: *Nutrients, *Eutrophication, *Lake Michigan, Great Lakes, Chlorides, Nitrogen, Phytoplankton, Phosphorus, Trophic level, Silica, Nitrates, Water pollution effects, Limiting factors, Lake Erie, Lake Huron, Lake Superior, Diatoms.
Identifiers: Flushing rate.

To control eutrophication it must be determined what nutrients limit or control accelerated productivity in the Great Lakes. Studies during three investigations show that phosphorus, not nitrogen, is the nutrient whose increased inputs have accelerated eutrophication in Lake Michigan. This is

vident from data on phytoplankton, phosphorus, nd the trophic state of the Great Lakes; on con-ntrations of silica and nitrate nitrogen; and from utrient enrichment experiments with phytoplank-n assemblages from Lake Michigan. Results om the studies conclude that silica depletion will come an increasingly serious problem and that nosphorus pollution has caused an increased de-and by diatoms for available supplies of silica. hese two factors, and probably others, have con-ibuted to the accelerated eutrophication of the ke. Phytoplankton assemblages will change from ose dominated by diatoms to those with increas-g proportions of green and blue-green algae. Due the large volume and long residence time of ater in the lake, there will be a considerable time g before current management practices can ssibly have a large effect on inputs of nosphorus and the imbalance between nosphorus and silica. (Jones-Wisconsin)

ADIOCESIUM RETENTION BY RAINBOW ROUT AS AFFECTED BY TEMPERATURE ND WEIGHT,
olorado State Univ., Fort Collins. Dept. of adiology and Radiation Biology.
A. F. Gallegos, and F. W. Whicker.
Available from the National Technical Information Service as COO-115642. (1972), 25 p. 6 fig, 2 tab, 9 ref. AEC AT (11-1)-1156.

Descriptors: *Cesium, *Radioisotopes, Retention, Absorption, *Rainbow trout, *Temperature, *Weight, *Colorado, Lakes, Fish, Mathematical studies, Thermal pollution, Nuclear powerplants, Growth rates, Feeding rates, Productivity, Water pollution effects, Laboratory tests.
Identifiers: Montane lakes, Accumulation pattern, Salmo gairdneri.

A laboratory aquarium system was developed to test effect of water temperature on Cs-137 accumulation pattern for trout stocked in a Colorado montane lake within the range of temperatures expected in the lake during the growing season. Weight instead of age was selected as the second correlate. Cs-134 retention was observed in fish at 5.0, 8.3, 12.7, and 18.3C. Ten fish ranging in live weight from 30 to 200 grams were maintained as active feeders at all temperatures. Some fish resided in the aquarium for more than 200 days without showing signs of ill health. Fish were removed from the aquarium by net for post-injection whole body counting. Weight of each fish was recorded after most radiocesium body burden determinations. Typical radiocesium retention patterns observed for a given temperature are presented. Waters heated from sub-optimum to optimum temperatures by thermal pollution can be expected to increase fish feeding rates and also their retention of radionuclides incorporated into growing tissues. These experiments imply that maximum cesium intake and retention by fish would be achieved at water temperatures which were optimal for food consumption and growth. (Jones-Wisconsin)

Descriptors: *Detritus, *Copepods, *Estuaries, *Food chains, Reproduction, Bacteria, *Maryland, Foods, Marshes, Productivity.
Identifiers: Eurytemora affinis, Isochrysis galbana, Thalassiosira pseudonana, Chlamydomonas reinhardti, Patuxent River (Md.), Zizenia aquatica.

To ascertain if the copepod, Eurytemora affinis, a suspected detritivore, can utilize detritus or associated microorganisms as a food source, an index of food utilization was established as greatest reproduction, determined by number of egg sacs and eggs per sac. Feeding experiments were conducted using three concentrations of algae, three species of bacteria (isolated from the Patuxent Estuary near the river mouth), and detritus synthesized from wild rice plants, Zizenia aquatica, and dried marsh plants. Both autoclaved and unautoclaved detritus caused more reproduction than starved copepods and less than copepods fed algae. The unautoclaved detritus caused better reproduction than autoclaved detritus. A suspension of clay particles coated with organic matter derived from boiled marsh grass was offered to the copepods. The Eurytemora readily ingested clay particles ranging from about 2 to 15 microns, but disperse suspensions of that material could not be maintained. Some chemical analyses were done on algae and on the dried marsh plants to find if there are gross differences in chemical composition. A site for measurement of detritus flux to and from a marsh was chosen and production of living marsh plants was estimated. (Jones-Wisconsin)

EFFECTS OF SALINE WATERS UPON SURVIVAL OF FISH EGGS AND LARVAE AND UPON THE ECOLOGY OF THE FATHEAD MINNOW IN NORTH DAKOTA,
North Dakota State Univ., Fargo. Dept. of Zoology.
J. J. Peterka.
Available from the National Technical Information Service as PB-223 017, $2.75 in paper copy, $1.45 in microfiche. North Dakota Water Resources Research Institute, Fargo, Completion Report WI-221-013-72, January 1972. 11 p. OWRR A-027-NDAK (1).

Descriptors: *North Dakota, *Fish reproduction, *Fish, *Salinity, Fish eggs, Larvae, Minnows, Pikes, Walleye, Fry, Fish farming, Ducks (Wild), Fish diets, Animal growth, Dissolved solids, Growth rates, Fish food organisms, Fish diseases.
Identifiers: *Pothole lakes, *Fathead minnow, Lake Ashtabula (N.D.), Garrison Diversion Project (N.D.), Ligula intestinalis.

Because North Dakota saline pothole lakes offer a good potential for fish culture and the anticipation of increased salinity from return flows from the Garrison Diversion Irrigation Project, salinity tolerance of the fathead minnow, northern pike, and walleye were evaluated. Also studied was the influence of the levels of dissolved solids on egg and sac fry survival and the fathead minnow's food habits. Laboratory experiments indicated that in water of 1300 micromhos, eggs of fathead minnow, northern pike and walleye hatched well, but when salinity reached 4000 micromhos, there was no hatching of walleye, a very poor hatch of northern pike eggs, but a good hatch of fathead minnow eggs. No northern pike sac fry survived in water of 6000 micromhos and all fathead minnow sac fry (about 1%) surviving in 12,000 micromhos had physical abnormalities. Water in saline lakes with an early summer total dissolved solid concentration of 7000 ppm was not detrimental to fathead minnow reproduction and growth. Fathead minnows consume food similar to several duck species inhabiting the pothole lakes. (Jones-Wisconsin)

EVALUATION OF POTENTIAL RISK OF BOTULISM FROM SEAFOOD COCKTAILS,
California Univ., Berkeley. Lab. for Research in the Canning Industries.
P. Lerke.
Applied Microbiology, Vol 25, No 5, p 807-810, May 1973. 3 tab, 10 ref.

Descriptors: *Evaluation, *Shellfish, *Toxicity, *Botulism, Crabs, Shrimp, Hydrogen ion concentrations, Toxins, Anaerobic bacteria, Pathogenic bacteria, Marine bacteria, Temperature, Organic acids, Laboratory tests.
Identifiers: *Seafood, *Clostridium botulinum E, Sample preparation, Cancer magister, Pandalus jordani, Citric acid, Acetic acid.

Freshly cooked and peeled meat of the Pacific Coast crab Cancer magister or the coastal shrimp (Pandalus jordani) was used to determine the risks of botulism from seafood cocktails. The meat was homogenized in a blender with an equal weight of water containing NaCl and sucrose. An equal mixture of citric and acetic acids were used to adjust pH, after which the homogenate was placed in test tubes, autoclaved and cooled. Tubes of crab meat and shrimp homogenates were inoculated with C. lootulinum E in six runs and four runs, respectively, and peroidically tested for toxin. Crab leg muscles were inoculated with about 10,000 spores, placed in sauces of different pH values, stored at 10, 24, and 30C, and periodically tested for toxin. Leg muscles were also tested for acid penetration. Clostridium botulinum E could not be detected in 35 samples of commerical seafood cocktails, ranging in pH from 4.10 to 4.85. At 30C, toxinogenesis in homogenates acidified with a citric-acetic acid mixture was prevented at pH 4.86 or lower for crabmeat and at 5.03 or lower for shrimp. Measurements of the rate of acid penetration into the centers of large pieces of flesh indicated that the already small risk of botulism from seafood cocktails could be completely eliminated by using a cocktail sauce at a maximum pH of 3.70 and by cooling the final product to at least 10C for 24 h. (Holoman-Battelle)

FERMENTATION OF GLUCOSE, FRUCTOSE, AND XYLOSE BY CLOSTRIDIUM THERMOACETICUM: EFFECT OF METALS ON GROWTH YIELD, ENZYMES, AND THE SYNTHESIS OF ACETATE FROM CO2,
Georgia Univ., Athens. Dept. of Biochemistry.
J. R. Andreesen, A. Schaupp, C. Neurauter, A. Brown, and L. G. Ljungdahl.
Journal of Bacteriology, Vol 114, No 2, p 743-751, May 1973. 4 fig, 4 tab, 54 ref.

Descriptors: *Heavy metals, *Growth rates, *Enzymes, *Fermentation, Clostridium, Metabolism, Cultures, Manganese, Boron, Zinc, Aluminum, Nickel, Copper, Water pollution effects, Toxicity, Carbon dioxide, Synthesis, Bioassay.
Identifiers: *Clostridium thermoaceticum, Xylose, Fructose, Glucose, Culture media, Sugars, Selenium, Corrinoids, Acetates, Biosynthesis.

Clostridium termoaceticum ferments xylose, fructose, and glucose with acetate as the only product. In fermentations with mixtures of the sugars, xylose was first fermented, then fructose, and last, glucose. Fructose inhibits the fermentation of glucose, and this inhibition appears to be due to a repression of the synthesis of an enzyme needed for glucose utilization. Addition of metals to the culture medium increased the cell yield drastically from about 7 to 18 g per liter, and Y (glucose) values between 40 and 50 were obtained. According to the postulated pathways of the fermentation of glucose and synthesis of acetate from CO2 by C. thermoaceticum, 3 mol of ATP are available as energy for growth. Thus a Y (adenosine 5'-triphosphate) of 13 to 16 is obtained. Because the normal Y (ATP) value is 10.5, this could mean that an additional source of ATP is available by an unknown mechanism. The addition of metals also increases the nicotinamide adenine dinucleotide phosphate-dependent formate dehydrogenase activity, the overall reaction (C-14-labelled CO2 to acetate), and the incorporation of the methyl group of 5-methyltetrahydrofolate into acetate. These reactions are catalyzed very efficiently by cells harvested in early growth, whereas cells obtained at the end of a fermentation have very low formate dehydrogenase activity and capacity to incorporate CO2 into acetate. Enzymes present were not or were very little affected by the addition of metals to the growth medium. The amount of corrinoids in cells from early growth is low, hwereas it was high in delta-aminolevulinate dehydratase, which is high at the beginning of growth and low at the end. (Little-Battelle)

THE SELECTIVE TOXICITY OF ANTIMICROBIAL NITROHETEROCYCLIC DRUGS,
North East London Polytechnic (England). Dept. of Applied Biology.
D. I. Edwards, M. Dye, and H. Carne.
Journal of General Microbiology, Vol 76, No 1, p 135-145, May 1973. 9 fig, 1 tab, 25 ref.

Descriptors: *Inhibition, *Growth rates, *Clostridium, *Protozoa, Cultures, Pathogenic bacteria, Antibiotics (Pesticides), *Toxicity.
Identifiers: Metronidazole, Dimetridazole, Tinidazole, Nitrofuran, Gas evolution, Clostridium welchii, Clostridium tertium, Clostridium bifermentans, Clostridium pasteurianum, Clostridium sporogenes, Clostridium histolyticum, Clostridium tetanomorphum, Clostridium butyricum, Trichomonas vaginalis, Viable counts.

Three antimicrobial nitroimidazole drugs (metronidazole, dimetridazole, and tinidazole) inhibit a range of clostridia (C. welchii, C. tertium, C. bifermentans, C. pasteurianum, C. sporogenes, C. histolyticum, C. tetanomorphum, C. butyricum) and the protozoan Trichomonas vaginalis; they have an identical site and mode of action as specific electron acceptors from the pyruvate phosphoroclastic reaction. Analogues of the drugs are compared and the structural requirements for activity explained. The nitrofuran (nitrofurazone) probably has a different mechanism of action. (Little-Battelle)

UTILIZATION OF HYDROCARBONS BY CLADOSPORIUM RESINAE,
Dayton Univ., Ohio. Dept. of Biology.
L. Cofone, Jr., J. D. Walker, and J. J. Cooney.
Journal of General Microbiology, Vol 76, No 1, p 243-246, May 1973. 1 tab, 13 ref.

Descriptors: *Cultures, *Microbial degradation, *Organic compounds, *Pesticides, Fungi, Growth rates, Aldrin, Dieldrin, DDT, Bioassay, Aquatic fungi, Phenols, Water pollution effects, Diazinon.
Identifiers: *Cladosporium resinae, Rotenone, Malathion, Organic acids, Fate of pollutants, Glucose, Alkanes, Hexane, Heptane, Octane, Nonane, Decane, Undecane, Dodecane, Tridecane, Tetradecane, Pentadecane, Hexadecane, Nonadecane, Paraffin oil, Alkenes, Hexene-1, Octene-1, Decene-1, Dodecene-1, Tetradecene-7, 2-methyl undecane, 2 6 11-trimethyl dodecane, Cyclohexane, Cyclohexene, Aromatic hydrocarbons, Benzene, m-Toluic acid, p-Toluic acid, Benzoic acid, Catechol, Salicyclic acid, DL-Mandelic acid, Toluene, o-Xylene, m-Xylene, p-Xylene, Isopropylbenzene, Naphthalene, Anthracene, Phenanthrene.

Cladosporium resinae occurs in air, soil, and water and is capable of growing on hydrocarbons. Two strains were cultured with various hydrocarbons and with aldrin, dieldrin, diazonin, rotenone, malathion, and DDT to study their ability to degrade hydrocarbons. Fungal cells were harvested after 34 days from cultures showing growth. Cultures showing no growth were incubated for an additional 23 days. The fungus grew at various rates on the following hydrocarbons as the sole source of carbon: glucose, hexane, heptane, octane, nonane, decane, undecane, dodecane, tridecane, tetradecane, pentadecane, hexadecane, nonadecane, octene-1, decene-1, dodecene-1, tetradecene-7, 2-methyl undecane, cyclohexane, cyclohexene, benzene, toluene, o-xylene, m-xylene, and isopropylbenzene. Paraffin oil, hexene-1, 2, 6, 11-trimethyl dodecane, m-toluic acid, p-toluic acid, benzoic acid, catechol, salicyclic acid, DL-mandelic acid, p-xylene, phenol, naphthalene, anthracene, and phenanthrene did not support growth. C. resinae did not grow with the pesticides as sole carbon source. Growth on glucose or hexadecane was not inhibited by any of the pesticides, and several stimulated growth. Oxygen uptake also was not affected by pesticides. The ability to use a variety of hydrocarbons in the absence of organic nitrogen indicated by the present work, coupled with ability to grow on substrates which are recalcitrant to attack by many other organisms and in the presence of pesticides is consistent with the view that C. resinae can proliferate in ecological niches which cannot be occupied by other organisms. (Little-Battelle)

EXTRACTABLE LIPIDS OF GRAM-NEGATIVE MARINE BACTERIA: PHOSPHOLIPID COMPOSITION,
Georgetown Univ., Washington, D.C. Dept. of Biology.
J. D. Oliver, and R. R. Colwell.
Journal of Bacteriology, Vol 114, No 3, p897-908, June 1973. 1 fig, 9 tab, 67 ref.

Descriptors: *Marine bacteria, *Environmental effects, *Varieties, Chemical analysis, Aging (Biological), Temperature Classification, Pathogenic bacteria, Anaerobic bacteria, Aerobic bacteria, Bottom sediments, Sea water, Kelps, Marine algae, Cultures, Organic compounds, Solvent extractions, Isolation.
Identifiers: *Gram-negative bacteria, *Phospholipids, *Chemical composition, *Chemotaxonomy, Marine environment, Sample preparation, Natural organics, Biochemical characteristics, Substrate utilization, Vibrio algosus, Vibrio marinofulvus, Vibrio alginolyticus, Vibrio parahaemolyticus, Vibrio marinus, Vibrio cholerae, Agrobacterium stellulatum, Achromobacter aquamarinus, Spirillum linum, Pseudomonas perfectomarinus, Pseudomonas, Aeruginosa, Photobacterium fischeri, Arthrobacter marinus, Phosphatidylethanolamine, Phosphatidylglycerol, Diphosphatidylglycerol, Lyso-phosphatidylethanolamine, Thin layer Chromatography, Poly-beta-hydroxybutyrate.

Phospholipid compositions of 20 marine and estuarine bacteria were determined by thin-layer chromatography. Results showed that phospholipids of marine bacteria differed very little from those of nonmarine organisms with phosphatidylethanolamine, phosphatidylglycerol, and diphosphatidylglycerol being the predominant phospholipids in all strains examined. Lyso-phosphatidylethanolamine occurred in significant quantities among a number of the marine bacteria, and two of the isolates contained significant quantities of poly-beta-hydroxybutyrate. Effects of age and growth temperature on the phospholipid composition were also investigated. It is suggested that phylogenetic relationships among bacteria may be correlated with phospholipid composition. (Holoman-Battelle)

POLYNUCLEOTIDE SEQUENCE RELATIONSHIPS AMONG JAPANESE AND AMERICAN STRAINS OF VIBRIO PARAHAEMOLYTICUS,
Maryland Univ., College Park. Dept. of Microbiology.
T. E. Staley, and R. R. Colwell.
Journal of Bacteriology, Vol 114, No 3, p 916-927, June 1973. 4 fig, 5 tab, 38 ref.

Descriptors: *Marine bacteria, *Pathogenic bacteria, Public health, Radioactivity techniques, Varieties, Estuarine environment, Enteric bacteria, Estuaries, Crabs, Crustaceans, E. coli, Pollutant identification, Bioluminescence, Sea water, Isolation.
Identifiers: *Vibrio parahaemolyticus, *Polynucleotides, *DNA, *Chemotaxonomy, Chemical composition, Sample preparation, Vibrio alginolyticus, Vibrio spp, Nucleic acids, Vibrio cholerae, Deoxyribonucleic acid.

Polynucleotide sequence relationships between two reference Vibrio parahaemolyticus strains isolated from Japanese and American gastroenteritis

ıtients were investigated by use of P-32-labeled-NA/DNA reassociation in free solution. In addi-ɔn, these strains were similarly compared with 22 her strains of estuarine and marine vibrios, in-uding 11 strains previously identified as V. ırahaemolyticus (2 Japanese, 1 of unknonw loca-ɔn, and 8 American strains obtained from diverse ɔgraphical locations and sources in North Amer-a), 3 strains of V. alginolyticus, and 8 of Vibrio ɔp. Deoxyribonucleic acid (DNA) from the ɔanese and American gastroenteritis isolates ɔwed high relative levels of intraspecific duplex rmation (92 to 93%) when reassociated, recipro-lly, at 60C. Heterologous DNA duplexes ex-bited thermal elution midpoint (Tm (e)) values ɔmparable to those obtained from homologous ıplexes (88.0) when thermally eluted from ydroxyapatite, thus indicating high base-pair ɔmplementarity. Other V. parahaemolyticus rains showed DNA homologies of 85 percent or eater, with correspondingly high Tm (e) values 6.0 to 88.0) for the heteroduplexes formed. DNA two of three V. alginolyticus strains (ATCC 749 and 166-70) was 55 to 60 percent ɔmologous to reference V. parahaemolyticus NA preparations; Vibrio sp strain 5144 riginally classified as V. parahaemolyticus bio-pe 2 and subsequently as V. alginolyticus strain 44) showed only 24 to 26 percent DNA homolo-to the same reference DNA. These data provide idence that Vibrio sp strain 5144 is genetically stinct from the other V. alginolyticus strains ed in this study. Three bioluminescent strains ought to be closely related to V. ırahaemolyticus demonstrated only 24 to 31 per-nt DNA homology to the reference V. ırahaemolyticus DNA. These data firmly tablish the existence in some Atlantic and Gulf oast estuaries of organisms genetically very milar to V. parahaemolyticus, the causative ent of 'shirasu' food poisoning in Japan. loloman-Battelle)

XYGEN TOXICITY AND THE SUPEROXIDE ISMUTASE,
uke Univ., Durham, N.C. Dept. of Biochemistry.
M. Gregory, and I. Fridovich.
ournal of Bacteriology, Vol 114, No 3, p 1193-97, June 1973. 4 fig, 1 tab, 13 ref.

escriptors: *Toxicity, *Oxygen, *E. coli, *Re-stance, Enzymes, Enteric bacteria, Aerobic con-tions, Cultures, Soil bacteria, Coliforms, Aero-c bacteria.
entifiers: *Superoxide dismutase, *Sensitivity, Bacillus subtilis, Streptonigrin, Catalases, Func-onal groups, Bacterial physiology.

xygen caused an increase in the amount of su-eroxide dismutase in Escherichia coli B but not in acillus subtilis. E. coli B cells, induced by growth nder 100 percent 02, were much more resistant to e lethal effects of 20 atm of 02 than were cells hich contained the low uninduced level of this nzyme. In contrast, B. subtilis, which could not spond to 02 by increasing its content of superox-e dismutase, remained equally sensitive to yperbarie 02 whether grown under 100 percent 02 aerobically. The catalase in these organisms ex-bited a reciprocal response to oxygen. Thus, the atalase of E. coli B was not induced by 02, hereas that of B. subtilis was so induced. These sults are consistent with the view that superox-e dismutase is an important component of the efenses of these organisms against the toxicity of xygen, whereas their catalases are of secondary nportance in this respect. The ability of reptonigrin to generate 02 (minus) by a cycle of reduction followed by spontaneous reoxidation, has been verified in vitro. It is further observed that E. coli B which contain the high induced level of superoxide dismutase were more resistant to the lethality of this antibiotic, in the presence of oxygen, than were E. coli B which contained the low uninduced level of this enzyme. This difference between induced and uninduced cells was eliminated by the removal of 02. These results are consistent with the proposal that the enhanced lethality of streptonigrin under aerobic conditions may relate to its in vivo generation of 02 (minus) by a cycle of reduction and spontaneous reoxidation. In toto, these observations lend support to the hypothesis that 02 (minus) is an important agent of oxygen toxicity and that superoxide dismutase functions to blunt the threat posed by this reactive radical. SENSITIVITY OF VIBRIO PARAHAEMOLYTICUS TO COLD IN OYSTERS, FISH FILLETS AND CRABMEAT,
Washington Univ. Seattle. Inst. for Food Science and Technology.
H. C. Johnson, and J. Liston.
Journal of Food Science, Vol 38, No 3, p 437-441, March/April 1973. 3 fig, 4 tab, 24 ref.

Descriptors: *Temperature, *Cold resistance, *Pathogenic bacteria, *Freezing, *Freeze-thaw tests, Shellfish, Marine fish, Pollutants, Thermal stress, Marine bacteria, Enteric bacteria, Crabs, Oysters, Isolation, Pollutant identification, Environmental effects, Regression analysis.
Identifiers: *Vibrio parahaemolyticus, *Seafood, Sensitivity, Survival, Vibrio alginolyticus, Mutants, Sample preservation, English sole, Parophrys vetulos, Pacific oyster, Crassostrea gigas, Cancer magister.

Raw and slightly cooked Pacific oysters (Crassostrea gigas) and, in some instances, crabment (Cancer magister) and fish fillets (Parophrys vetulos) were used to determine if Vibrio parahaemolyticus survives freezing when present naturally in seafood materials. Oysters were contaminated by feeding or injecting the organisms into the digestive tract. Fish fillets and crabmeat were contaminated within Polymylar pouches by pipetting 1 ml of an appropriate dilution onto the surface of the meat and massaging the pouch for even distribution. The inoculated oysters were refrigerated or frozen at 11, 8, 5, 1, -15 and -30C and subsequently stored for varying periods of time at the same respective temperature. Fish and crabmeat were treated in a similar manner, except that only 1, -15 and -30C were utilized. Samples were removed from storage at intervals, thawed at room temperature and the content of V. parahaemolyticus or V. alginolyticus determined by a surface plate count. Duplicate plates for each appropriate dilution were incubated at 37C and/or 43C for 18-20 hr, and counts of V. parahaemolyticus obtained on plates containing 30-300 colonies. Counts were confirmed after an additional 18-20 hr incubation at the appropriate temperature to allow for growth of 'sub-lethally' damaged cells that might not have appeared after the original 18-20 hr of incubation. Only those colonies which conformed to the characteristics of V. parahaemolyticus (or V. alginolyticus) on the appropriate medium were counted. The pattern of death observed in crabmeat appears to be different from that observed in oysters and fish, in that death at 1C and -15C was essentially linear with little evidence of the two-stage mortality seen in oysters and fish fillets. The two strains of V. parahaemolyticus did show a marked two-stage mortality pattern at -30C, although the extent of the first-stage and second-stage death varied; the V. alginolyticus strain yielded an indication of two-stage mortality at -30C. Crabmeat appeared to offer less protection against chilling and freezing lethality to vibrios than either fish or oyster tissue, but further investigations would be required. The results indicate that chilling, freezing, or frozen storage temperatures per se cannot be relied upon to successfully eliminate the organism from seafoods or prevent the health hazard that is presented by V. parahaemolyticus. (Holoman-Battelle)

SUCCESSION: SIMILARITIES OF SPECIES TURNOVER RATES,
Oak Ridge National Lab., Tenn.
H. H. Shugart, and J. M. Hett.
Science, Vol 180, No 4093, p 1379-1381, June 1973. 1 fig, 4 ref.

Descriptors: *Succession, *Biological communities, Turnovers, Ecosystems, Model studies, Aquatic environment, Terrestrial habitats.
Identifiers: *Turnover rates, *Rate coefficients, Laboratory microcosms, Heterotrophy, Autotrophy.

Rate coefficients have been examined for species turnover in published studies on succession to associate community dynamics with succession. The rate coefficients for species turnover (the proportion of species lost per unit time) for successional communities decrease as the communities approach some equilibrium state. This observation makes it possible to determine the parameters of a two-parameter model which quantifies the time variation of successional changes in the second derivative. For all the communities examined the rate coefficient was found to decrease with the age of the community, which indicates a deceleration in the rate of species loss. This pattern applies to heterotrophic and autotrophic successions, aquatic and terrestrial successions, and successions in laboratory microcosms and large natural ecosystems. (Holoman-Battelle)

ABNORMAL SHAPE CHANGE BY NITZSCHIA PALEA IN CULTURE, (ABNORMALER FORMENWECHSEL VON NITZSCHIA PALEA IN KULTUR),
National Inst. for Water Research, Pretoria (South Africa).
K. von Cholnoky-Pfannkuche.
Nova Hedwigia, Vol 21, Nos 2-4, p 883-886, 1971. 9 fig, 7 ref.

Descriptors: *Chrysophyta, *Cultures, *Essential nutrients, *Plant morphology, Diatoms, Plant pathology, Environmental effects, Deficient elements, Aquatic algae.
Identifiers: *Nitzschia palea, Chemical concentration.

In cultures of Nitzschia palea cultivated for a number of years, the following abnormalities were observed: the length of the valvae diminished and finally measured only 6.5-10 microns, but the breadth did not change. The cell divisions were also disturbed. The daughter cells were at various places irregularly indented, but the genotypically determined characteristics of Nitzschia palea remained unchanged. A change in the nutrients did not influence the length of the cells, but an increase of the SiO2-concentration resulted in more normal shape of the valvae. (Holoman-Battelle)
W73-14074

EFFECT OF THE CHEMICAL COMPOSITION OF THE MEDIUM ON THE GROWTH OF CHLORELLA PYRENOIDOSA,
Instytut Zootechniki, Oswiecim (Poland) Samodzielna Pracownia Biologii Ryb i Strodowiska Wodnego.
J. Zarnowski.
Acta Hydrobiologica. Cracow., Vol. 14, No 3, p 215-223, 1972. 1 fig, 4 tab, 18 ref.

Descriptors: *Growth rates, Chlorophyta, Aquatic algae, Cultures, Plant growth, Nutrients, Biomass, Essential nutrients.
Identifiers: *Culture media, *Substrate utilization, *Chlorella pyrenoidosa, *Chemical composition, Culturing techniques, Ethylenediaminetetraacetic acid.

A study was conducted to observe the intensity of growth of Chlorella pyrenoidosa on 16 media selected from the literature, and to investigate the effect of different EDTA concentrations in the medium on the algal culture growth rates measured by the number of cells/ml and the weight of dry matter. Pure cultures of Chlorella were used and the same concentration of microelements was used in all media. The culture was grown under non-sterile conditions with a temperature of 24 plus or minus 2C for 14 days under an illumination of 7.500 lux for 16 hr/day. Simultaneously, the culture was aerated with air enriched with CO2 to prevent sedimentation of algae and to intensify the photosynthetic process. Before the beginning and end of culturing, amounts of N, P, and K in the media were determined. Four media (Kanazawa, Myers, Tamiya, and Warburg) were selected because of the intensive growth observed and each used in four combinations: without EDTA and with 7, 37, and 100 mg EDTA/l of culture. Cultural conditions were the same except the temperature range was 19-22C. Of the investigated media those of Kanazawa and Tamiya ensured the most intensive growth of Chlorella. The best utilization of nutrients by the Chlorella cultures was observed on the Tamiya medium. Ethylenediaminetetraacetic acid (EDTA) stimulated the growth of the alga cultures. (Holoman-Battelle)

Identifiers: *Utah Lake, Provo Bay, Chironomids.

Utah Lake, Provo, Utah, is a large shallow lake that receives the effluents from nine waste water treatment plants. Provo Bay, an eastern extension of Utah Lake, receives much of the total volume of these effluents. A study was undertaken to determine the effect of the added nutrients on the chemistry and biota of Utah Lake. Established sites were sampled weekly during the summer months and periodically during the winter using either a boat or snowmobile. On-site measurements were made for DO, carbon dioxide, pH, turbidity. Laboratory tests included those for BOD, coliform density, phosphates, nitrates, ammonia, Ca, Mg, Na, K, chloride, bicarbonate, and sulfate. During the summer months, large chemical changes take place as the water that enters with high concentrations of nutrients moves through Provo Bay. These nutrients are effectively removed by the great algal bloom in the center of Provo Bay. Part of the carbon needed for algal growth is supplied by the great amount of bicarbonate in the Utah Lake water. (Holoman Battelle)

BEHAVIOR OF YOUNG ATLANTIC SALMON (SALMO SALAR) EXPOSED TO OR FORCE--FED FENITROTHION, AN ORGANOPHOSPHATE INSECTICIDE,
Fisheries Research Board of Canada, St. Andrews (New Brunswick). Biological Station.
P. E. K. Symons.
Journal of the Fisheries Research Board of Canada, Vol 30, No 5, p 651-655, May 1973. 1 fig, 11 ref.

Descriptors: *Atlantic salmon, *Fish behavior, *Phosphothioate pesticides, *Water pollution effects, Juvenile fish, Organophosphorus pesticides, Insecticides, Fish physiology, Food habits, Bioassay.
Identifiers: *Fenitrothion, *Parr, Locomotion, Salmo salar, Pollutant effects.

Exposure of young Atlantic salmon (Salmo salar) to 1.0 ppm fenitrothion for 15-16 hr caused a 50 percent decrease in the number holding territories 6 days following treatment. Some severely affected fish also swam stiffly and ceased feeding, but these effects disappeared within 48 hr following return to clean water. Territories were not reclaimed for approximately 2-3 weeks. Exposure to 0.1 ppm fenitrothion for 15-16 hr caused a lesser (20 percent) reduction in numbers of fish holding territories. When mealworms (Tenebriosp) injected with 2-5 microliters pure (100 percent) fenitrothion were force-fed to young salmon, 50 percent were regurgitated 8-12 hr afterwards. Almost all mealworms containing 10-20 microliters fenitrothion were regurgitated. The proportion of worms regurgitated remained constant during a week of daily force-feedings but, 24 hr after the third or fourth feeding, all fish except controls could be made to flex tetanically by rapping on the aquarium, and they made little attempt to escape a dipnet. LAND DISPOSAL AND SEWAGE EFFLUENT: APPRAISAL OF HEALTH EFFECTS OF PATHOGENIC ORGANISMS,
Hahnemann Medical Coll. and Hospital, Philadelphia, Pa.
M. A. Benarde.
Journal of the American Water Works Association, Vol 65, No 6, p 432-440, June 1973. 7 fig, 43 ref.

Descriptors: *Water reuse, *Sewage disposal, *Public health, *Potable water, *Reviews, *Human diseases, Pathogenic bacteria, Reclaimed water, Waste water (Pollution), Irrigation, Waste disposal, Salmonella, Viruses, Soils, Path of pollutants, Waste water disposal, Domestic wastes, Municipal wastes, Sewage, Coliforms, Epidemics, Water pollution effects, Shigella.
Identifiers: Land disposal, Fecal pollution.

Concern about pollution of surface waters, especially by human and animal fecal wastes has evoked interest in alternate methods of disposal of these waters as well as in the reuse of waters. The literature concerning possible health hazards a the advantages of disposing fecal wastes on land reviewed. Although many questions remain to b answered, reuse of water and land disposal treated fecal wastes should pose no health threat if proper regulations are established and followed. Waste waters may in the future be used as a sourc of drinking water. (Little-Battelle)

Medical and public health interest i polychlorobiphenyls (PCBs) in the United State was meager before 1970. The expanding literatur since then has reflected the realization of the im portance of these substances as environmenta pollutants. The analytical confusion of PCB with DDT and other chlorinated hydrocarbon pesti cides prior to 1969 is of special interest. The con cern over PCBs was heightened in 1971 by the recognition of gross contamination of certain animal feeds and of trace contamination of some human foods. The 870 articles cited in this bibliog raphy are believed to cover the majority of articles in all languages available through January, 1972 This bibliography is part I of a state-of-the-ar review. Part II will contain the review. (Holoman Battelle)

Descriptors: *E. coli, *Food webs, Competition, Food chains, Predation, Trophic level, Model studies, Cycling nutrients, Protozoa, Bacteria.
Identifiers: *Minimal media, *Glucose, Tetrahymena pyriformis, *Azotobacter vinelandii, Continuous cultures, *Species interaction, Substrate utilization, Chemostat, Culture media, Population density.

A study was made of the food web formed from a protozoon, two bacteria, and a glucose minimal medium in chemostat culture. The system was also divided into simpler parts, first by omitting the protozoon to obtain a competition system, and then by omitting one or the other of the bacteria to obtain two food chains. In the competition studies, one bacterium was displaced by the other at all holding times used. In the food chain studies, sustained oscillations of the population densities of predator and prey developed at short holding times, and then changed to damped oscillations at longer holding times. In addition, the level of residual glucose remained high at long holding times. A new model of microbial growth is necessary to explain these results. In the food web studies, predation of the protozoon on the two bacteria stabilized the competition between the latter and allowed their coexistence in the same habitat. Thus, Gause's principle was circumvented. (Holoman-Battelle)

PUBLIC HEALTH ASPECTS OF ORGANICS IN WATER,
California State Dept. of Public Health, Berkeley.
H. J. Ongerth, D. P. Spath, J. Crook, and A. E. Greenberg.
Journal of the American Water Works Association, Vol 65, No 7, p 495-498, July 1973. 23 ref.

Descriptors: *Water reuse, *Public health, *Toxicity, *Organic matter, Reviews, Water analysis, Organic wastes, Waste water (Pollution), Potable water, Water utilization, Pollutant identification, Pollutants.
Identifiers: Characterization, Carcinogenicity, Mutagenicity, Teratogenicity.

Interest in reuse of wastewaters for consumptive purposes necessitates that their components and potential effects be investigated. A literature survey for information regarding characterization of waters for residual organics has shown that very little is known about organic products in water. Even less is known about their effects, individually or in combination, on man. Review of studies that have been conducted revealed that organic compounds are often very complex and difficult to characterize. Toxic effects, especially long-term effects such as carcinogenicity, mutagenicity, and teratogenicity are likewise difficult to determine because of uncertainties in dosages which might occur under natural conditions and because of possible synergistic effects of contaminants. Much information will be needed before water can be reused for consumptive purposes. (Little-Battelle)

Descriptors: *Industrial plants, *Industrial wastes, *Potassium, *Environment, *Water pollution effects, Water pollution sources, Air pollution, Soil contamination, Salinity, Salts, Brines, Chlorides, Vegetation, Surface waters, Water types, Reservoirs.
Identifiers: USSR.

Investigations were conducted in 1969-1971 in the region of the Soligorsk combine 'Beloruskaliy' to study damage inflicted by wastes from potassium concentration plants to soil, vegetation, surface waters, groundwater, and air. Soil around these plants is subjected to salinization by salts from gaseous wastes and by brines carried by rain and melt water from salt dumps. As much as 2.28 meq of chlorides/100 g of soil accumulate in the upper 2-cm layer within a radius of 1 km of the plants. Concentration of chlorides in snowmelt within a radius of 2 km of the pollution source is two or more times their average concentration in the European part of the USSR. Gaseous wastes from concentration plants have a toxic effect on vegetation, particularly potatoes, apples, and cherries, while oats and couch grass are relatively unaffected. As a result of periodic discharge of industrial wastes, chloride concentration in the Soligorsk Reservoir has increased sharply, and at a distance of 10 km from the waste discharge site is 12.5 times the original amount. NUTRIENT CYCLING AND PRODUCTIVITY OF DYSTROPHIC LAKE-BOG SYSTEMS (PART A),
Michigan Univ., Ann Arbor. School of Natural Resources.
F. F. Hooper.
Available from the National Technical Information Service as COO-1771-5. Technical Progress Report December 1972. 71 p, 19 fig, 10 tab, 66 ref, 3 append. ORA Project No. 016440, Contract No. AT (11-1)-1771.

Descriptors: *Iron, *Cycling nutrients, *Phosphorus, *Aquatic productivity, *Dystrophy, Hypolimnion, Epilimnion, Connate water, Measurement, Path of pollutants, Leachate, Radioactivity techniques, Organophosphorus compounds, Mosses, Bogs, Lakes, Michigan, Ecosystems, Water sampling, Ions, Pollutant identification, Tagging, Stable isotopes, Surface waters, Anion exchange, Water analysis, Chemical analysis.
Identifiers: *Lake-bog systems, Sphagnum, Phosphorus cycle, Ribonucleic acid, Polyphosphates, Orthophosphates, Ion exchange chromatography, Dissolved organic phosphorus, P-32, Nucleic acids.

Three items concerned with nutrient cycling are discussed: (1) Organic Phosphorus Compounds of a Northern Michigan Bog, Bog-Lake System, (2) The Role of Sphagnum in the Cycling of Phosphorus in a Bog-Lake System, and (3) Ionic State and Coordination of Iron in Bog Lakes. The organophosphorus compounds produced in the bog mat were identified as hydrolytic products of ribonucleic acids as well as free mono-, di-, and triphosphate nucleotides. The inorganic P of the epilimnion and the mat waters were chiefly orthophosphate; that of the hypolimnion consisted of ortho- and polyphosphate P. The direct application of P-32 to the surface of Sphagnum produced a leachate consisting entirely of soluble unreactive P which was flushed into the lake (surface water and hypolimnion) when rains created a hydrologic gradient of flow within the mat. P-32 injected directly into the interstitial water of the mat produced a leachate of entirely particulate unreactive phosphorus. This was also flushed into the lake by the action of the rain and persisted in the surface water with little or no loss or transformation for a period in excess of 3 weeks. The presence of ionic Fe (II) without complexation was confirmed as the predominant form of Fe in the deoxygenated waters of the bog according to the sampling methods and reaction scheme used. However, the chemical state of iron present in the lake varied considerably in form and amount with depth. (Holoman-Battelle)

KINETICS OF AMINO ACID INFLUX INTO NITELLA FLEXILIS,
Windsor Univ. (Ontario). Dept. of Biology.
D. G. Wallen.
Journal of Phycology, Vol 9, No 2, p 148-152, June 1973. 3 fig, 1 tab, 24 ref.

Descriptors: *Kinetics, *Absorption, *Amino acids, *Inflow, *Aquatic algae, Radioactivity techniques, Organic acids, Chromatography, Radiochemical analysis, Organic compounds, Aquatic plants.
Identifiers: *Nitella flexilis, Glycine, Alanine, Valine, Arginine, Aspartic acid, Autoradiography, Scintillation counting, Stoneworts.

The uptake of amino acids by Nitella flexilis has been investigated. Separated internodal cells of the alga were placed in artificial pond water to which had been added C-14-labeled L-amino acids (glycine, alanine, valine, arginine, and aspartic acid) to give concentrations up to 30 mM. The experiments were conducted at 20C. At the end of the experiments, the labeled cells were harvested and the radioactivity measured. In some cases, the nature of the C-14-labeled organic compounds was determined. Influx of glycine, alanine, and valine appears to be a diffusive process. Influx ranged from 0.14 to 0.06 and 0.04 pmoles/ (cm) (sec), respectively. Aspartic acid uptake is an active transport mechanisms. The V sub max is 2.8 pmoles/ (cm) (sec); the transport constant (Michaelis constant) K sub m, 0.0078 M. The uptake of arginine is apparently due to 2 transport systems, one with a V sub max and K sub m of 3.1 pmoles/ (cm) (sec) and 0.0032 M, respectively. The second system has a V sub max of 1.4 pmoles/ (cm) (sec) and a K sub m of 0.00021 M. The possibility that the second system is diffusive has been considered. (Holoman-Battelle)

OBSERVATIONS ON THE STRUCTURE OF SOME FORMS OF GOMPHONEMA PARVULUM KUTZ. II. THE INTERNAL ORGANIZATION,
Bristol Univ. (England). Dept. of Botany.
P. A. Dawson.
Journal of Phycology, Vol 9, No 2, p 165-175, June 1973. 25 fig, 41 ref.

Descriptors: *Diatoms, *Plant morphology, *Aquatic algae, *Electron microscopy, *Cytological studies, Chrysophyta, Cultures.
Identifiers: *Gomphonema parvulum, Light microscopy, Ultrastructure, Frustules, Sample preparation, Cell wall, Characterization.

The diatom species Gomphonema parvulum Kutz. was isolated, grown in culture, and the details of the internal organization studied by light and electron microscopy. The organism is usually identified from its frustular morphology, but members of the genus Gomphonema can be separated from other naviculoid forms by the H-shaped chromatophore, whose lobes are connected on 3 sides across the center of the cell, and also from the position of the pyrenoid. This is situated on the inner side of the chromatophore and is not embedded in the center of the chromatophore. New observations of this pennate diatom include details of the periplastidial network, of the Golgi vesicu-

lar activity, and of the storage products. (Holoman-Battelle)

CONTINUOUS CULTURE OF MARINE DIATOMS UNDER SILICATE LIMITATION. I. SYNCHRONIZED LIFE CYCLE OF SKELETONEMA COSTATUM,
Washington Univ., Seattle. Dept. of Oceanography.
C. O. Davis, P. J. Harrison, and R. C. Dugdale.
Journal of Phycology, Vol 9, No 2, p 175-180, June 1973. 5 fig, 3 tab, 42 ref.

Descriptors: *Diatoms, *Deficient elements, *Silicates, *Life cycles, Marine algae, Chrysophyta, Plant growth, Cultures, Plant physiology, Growth rates, Limiting factors, Essential nutrients, Reproduction.
Identifiers: *Synchronization, *Skeletonema costatum, Continuous cultures, Chemostat, Culturing techniques.

Skeletonema costatum was grown in silicate-limited continuous culture. Culture conditions resulted in synchronization of sexual reproduction. A detailed description of the life cycle is presented. During the life cycle growth rates varied from 0 to 0.12/hr. Sexual reproduction in diatoms has often been observed in batch cultures and some stages have been reported in nature. However, this is apparently the first report of its occurrence in continuous culture. Other experiments that demonstrate the importance of sexual reproduction in continuous culture work are discussed. (Holoman-Battelle)

PH AND EH CONTROL OF CULTURES OF SULPHATE-REDUCING BACTERIA,
University of Manchester Inst. of Science and Technology (English).
E. B. Brown, G. R. Groves, and J. D. A. Miller.
Journal of Applied Chemistry and Biotechnology, Vol 23, No 2, p 141-149, February 1973. 4 fig, 2 tab, 19 ref.

Descriptors: *Sulfur bacteria, *Hydrogen ion concentration, *Oxidation-reduction potential, *Cultural control, Inhibition, Solubility, Sulfides, Growth rates, Variability, Laboratory tests.
Identifiers: *Batch cultures, *Desulfovibrio vulgaris, Culturing vessels.

Batch cultures of Desulfovibrio vulgaris, carried out in a 5-litre stirred fermenter, are described. Bacterial counts and sulphide formation are reported for experiments carried out under a selection of controlled Eh and pH conditions. Specific growth and sulphide formation rates are determined and compared. Variations in the growth rates under the different controlled conditions are examined and discussed in terms of product inhibition by sulphide. A relatively high specific rate of exponential growth was observed at Eh equals -150 mV and pH equals 6.95, when sulphide inhibition was believed to be at a minimum. (Holoman-Battelle)

PHOTOLYSIS OF ETHYLENETHIOUREA,
California Univ., Davis. Dept. of Environmental Toxicology.
R. D. Ross, and D. G. Crosby.
Journal of Agricultural and Food Chemistry, Vol 21, No 3, p 335-337, May/June 1973. 3 fig, 1 tab, 15 ref.

Descriptors: *Absorption, *Aqueous solutions, *Water analysis, Solar radiation, Ultraviolet radiation, Urea pesticides, Water pollution sources, Degradation (Decomposition), Agricultural runoff, Separation techniques, Spectrophotometry, Drainage water.
Identifiers: *Ethylenethiourea, *Photodecomposition, Sample preparation, *Photolysis.

Ethylenethiourea (ETU) occurs as an impurity in and as an alteration product of technical ethylene bisdithiocarbamate fungicides. Its solubility in water suggests that it may occur as a contaminant in agricultural runoff. Therefore studies were conducted on the photodecomposition of ETU by preparing solutions with agricultural drainage or deionized water for exposure to sunlight or ultraviolet light. Decomposition products were isolated and identified by rotating vacuum evaporator and subjecting them to thin-layer chromatography. Separated compounds were detected by UV absorption. ETU was determined by evaporating samples, redissolving in methanol, and measuring absorbance at 239 nm. The results showed that ETU in aqueous solution (0.5-50 ppm) was stable to sunlight. However, in the presence of dissolved oxygen and sensitizers such as acetone or riboflavin, it was rapidly photooxidized via ethyleneurea and glycine sulfate. ETU decomposition also occurred in boiled samples of agricultural drainage waters in sunlight but not in the dark, indicating that natural photosensitizers may play an important part in the environmental transformations of xenobiotics. (Little-Battelle)
W73-14194

EFFECT OF NUTRIENT ADDITIONS ON THE APPARENT COMETABOLISM OF DDT,
Cornell Univ., Ithaca, N.Y. Lab. of Soil Microbiology.
F. K. Pfaender, and M. Alexander.
Journal of Agricultural and Food Chemistry, Vol 21, No 3, p 397-399, May/June 1973. 1 fig, 2 tab, 10 ref.

Descriptors: *Sewage bacteria, *Microbial degradation, *DDT, DDD, DDE, Bioassay, Cultures, Nutrients, Sewage, Metabolism, Water pollution effects, Path of pollutants, Gas chromatography, Separation techniques.
Identifiers: *Cometabolism, *Fate of pollutants, DBP, Biotransformation, Sample preparation, Plate counts.

Raw sewage samples, half of which were autoclaved, were placed in Erlenmeyer flasks and treated with DDT and inorganic salts to obtain additional evidence on the significance of cometabolism in the microbial transformation of DDT. Sets of sterilized and unsterilized samples received additions of glucose or diphenylmethane. One set received no additions. All flasks were incubated at 30C. At periodic intervals, samples were removed and frozen for later extraction and analysis. At the same time, plate counts were made of the bacteria. For analysis, the samples were thawed, acidified with H_3PO_3, and extracted for 6 hours with ethyl ether. Extracts were concentrated with a flask evaporator and esterified by boiling with BC13-methanol. The microbial cultures were extracted in a separatory funnel, with n-hexane-ethyl ether. All extracts were dried, resuspended in acetone, and analyzed by gas chromatography. The products formed by microbiological degradation of DDT were the same as those identified in other studies, namely, DDD, DDE, and DBP (4,4'-dichlorobenzophenone). The addition of glucose enhanced the rate of DDD formation but slowed DBP biosynthesis, and additions of diphenylmethane reduced the rate of formation of both DDD and DBP. The numbers of microorganisms potentially able to cometabolize DDT were high in raw sewage, but their abundance rose markedly as a result of the addition of glucose and diphenylmethane. Many of these microorganisms produced DDD, DDE, and DBP. (Little-Battelle)
W73-14196

MOLYBDENUM TOXICITY: ABNORMAL CELLULAR DIVISION OF TERATOGENIC APPEARANCE IN EUGLENA GRACILIS,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Veterinary Science.
G. Colmano.
Bulletin of Environmental Contamination and Toxicology, Vol 9, No 6, p 361-364, June 1973. 2 fig, 9 ref.

Descriptors: *Molybdenum, *Toxicity, *Cytological studies, Cultures, Heavy metals, Euglenophyta, Phytoplankton, Water pollution effects, Aquatic algae.
Identifiers: *Euglena gracilis, *Teratogenicity, Pollutant effects, Euglena gracilis var. bacillaris, Culture media.

Molybdenum is shown to be involved in the mechanism of cellular division that produces monsters in Euglena. Euglena cells were first grown in a medium containing 5.44 ppm molybdenum. These cells divided by normal fission and had a normal growth rate. When the molybdenum concentration was accidently increased 20 fold, abnormal clusters of three to nine actively moving cells attached to each other at one end appeared. In further experiments, these abnormal forms, accompanied by blue coloration of the culture medium, appeared only with high molybdenum concentrations. Change in concentration of other components affected only the growth rate. Molybdenum may be considered toxic and may be an inhibitor of cellular fission with resultant nuclear and chromosomal polyploidy and abnormal mitoses. A similar toxicity of molybdenum may activate the uncontrolled growth patterns observed in some neoplastic growths. (Mortland-Battelle)

5D. Waste Treatment Processes

COMBINED TREATMENT OF MUNICIPAL WASTEWATER AND ACID MINE DRAINAGE,
Pennsylvania State Univ., University Park. Dept. of Civil Engineering.
F. H. Pearson, and J. B. Nesbitt.
Available from the National Technical Information Service as PB-222 936, $3.00 in paper copy, $1.45 in microfiche. Research Publication No 73, Pennsylvania Institute for Research on Land and Water Resources, Dec, 1972. 43 p, 15 fig, 1 tab, 20 ref, 4 append. OWRR B-042-PA (1). 14-31-0001-3636.

Descriptors: *Mine drainage, *Design, Economics, *Wastewater treatment, *Acid mine water, Recycling, Iron, *Pennsylvania, Cost analysis.
Identifiers: *Combined treatment.

Acid mine drainage (AMD), a serious water pollutant in many states may be an economical source of ferrous iron for the chemical coagulation of municipal wastewater. AMD would then be neutralized by the alkalinity in wastewater. Samples of AMD and raw wastewater were collected from sites in Pennsylvania where AMD was found close to a wastewater treatment plant. The samples were mixed in varying ratios, then processed at controlled pH in a laboratory scale treatment plant that provided flocculation and sedimentation. The optimal pH was 8 for a maximum reduction in phosphorus, ferrous iron, and turbidity. At pH 8 the median reduction in total phosphorus was 95 percent when the molar ratio of ferrous iron to total phosphorous was 2. The median reduction in

BOD was 75 percent when the ferrous iron dose rate was 10 - 20 mg Fe/1, and at pH 8. Ferrous iron was almost completely removed at pH 8. A cost analysis showed that there is a maximum distance for which it is economical to pump AMD for combined treatment with wastewater, beyond which chemical treatment is less expensive.

WASTE WATER TREATMENT FACILITIES, TRAINING MANUAL.
Environmental Protection Agency, Cincinnati, Ohio.

Available from NTIS, Springfield, Va. 22151 PB-214 516 Price $6.75 printed copy; $1.45 microfiche. EPA Office of Water Programs, Training Program, July 1971. 261 p.

Descriptors: *Waste water treatment, *Training, *Education, *Publications, Industrial wastes, Municipal wastes, Sewage treatment, Filtration, Flocculation, Trickling filters, Sewage lagoons, Water pollution control, Methodology.
Identifiers: *Wastewater treatment training manual.

This course is intended for planning and management personnel from public and private agencies planning to install new waste water treatment facilities or to undertake major construction to improve existing facilities. Manuals are prepared for reference use of students enrolled in scheduled training courses of the Water Quality Office, Environmental Protection Agency. This manual will be useful to anyone who has need for information on the subjects covered. However, it should be understood that the manual will have its greatest value as an adjunct to classroom presentations. Training is available at five installations of the Agency. These are: the National Training Center located at the Robert A. Taft Sanitary Engineering Center in Cincinnati, Ohio; the Robert S. Kerr Water Research Center, Ada, Oklahoma; the Southeast Water Laboratory, Athens, Georgia; the Pacific Northwest Water Laboratory, Corvallis, Oregon; and the Hudson-Delaware Basins Office, Edison, New Jersey. REGIONAL WATER SUPPLY/SEWAGE DISPOSAL PLAN AND SHORT-RANGE PROGRAM, 1973-1978.
Central New York Regional Planning and Development Board, Syracuse.

Available from NTIS, Sprinfield, Va., 22151, PB-217 516, Price $3.50 printed copy; $1.45 microfiche. November 1972. 27 p, 6 fig, 2 append. HUD 246-03.

Descriptors: *Water supply, *Sewers, *Planning, *New York, Urbanization, Water management (Applied), Land use.

Policies are presented of the Central New York Regional Planning and Development Board regarding the concurrent provision of public water and sanitary sewer service, particularly service extensions. The relationship of the sewer and water plans with other functional plans is illustrated. The significant impact that water and sewer systems have on urban development patterns, densities, and sequence is discussed. Major existing water supply and sanitary sewerage facilities necessary to implement the water and sewer plan and the land use plan are listed. These facilities are listed on a regional priority basis. (Knapp-USGS)

REMOVAL OF PHOSPHATES IN WASTEWATER BY THE PERIPHYTON COMMUNITIES OF ROTATING DISCS,
D. F. Jackson, and B. B. Jackson.
Verhandlungen Internationale Vereinigung Limnologie, Vol 18, Part 2, p 881-890, 1972. 1 fig, 14 tab, 10 ref.

Descriptors: *Technology, *Waste water treatment, *Phosphates, *Nutrients, *Periphyton, Domestic wastes, Sewage treatment, Biological treatment, *New York, Plankton, Trickling filters.
Identifiers: *Periphytic rotating discs, Fayetteville (N.Y.).

Competition between the plankton community and the periphyton for phosphorus in a wastewater treatment plant was evaluated. Whether periphyton pick up phosphorus at a faster rate than do plankton was determined in a series of experiments using P-32 and periphytic rotating discs, a patented design system, adapted for special treatment plants. Each of the discs was permitted to be colonized with a periphyton film before each experiment was begun. Four separate studies, one using raw sewage, one with primary effluent, one with trickling filter effluent and one with waste stabilization pond effluent are reported. Studies were made of each type of effluent using none, one, two or three rotating discs. After the discs had a film thickness of about one mm, 100 microcuries of P-32 were added to each pool. The periphyton always had a greater affinity for the P-32 and accumulated larger quantities than did the corresponding plankton biomass. It is recommended that modifications be made in design structure in wastewater treatment facilities to provide more environments for the periphyton. Through such facilities, the quantity of phosphates in the discharge waters could be greatly reduced and cultural eutrophication retarded or controlled. (Jones-Wisconsin)

AN INVESTIGATION OF TECHNIQUES FOR REMOVAL OF CHROMIUM FROM ELECTROPLATING WASTES,
Battelle Memorial Inst., Columbus, Ohio. Columbus Labs.

Available from the National Technical Information Service as PB-215 694, $3.00 in paper copy, $1.45 in microfiche. EPA Report, Water Pollution Control Research Series, March 1971. 91 p, 22 fig, 30 tab, 9 ref. EPA Project 12010 EIE 03/71.

Descriptors: *Activated carbon, *Chromium, *Waste water treatment, Industrial wastes, Metals, Pilot plants, Flotation, *Adsorption, Solvent extractions.
Identifiers: *Electroplating wastes.

Work was conducted on the removal of hexavalent chromium from plating rinse waters employing various treatment processes. The study consisted of an initial phase in which information was sought by questionnaire and by waste water analyses on the type of waste produced by smaller electroplating plants. Laboratory studies were conducted on serveral nonconventional methods for treatment of these wastewaters including ion flotation, absorption on activated carbon, and solvent extraction. A demonstration pilot-plant study also was conducted on the activated carbon process employing actual rinse waters from a hard chrome plating operation.
W73-13745

FINAL ENVIRONMENTAL IMPACT STATEMENT, SOPE CREEK DRAINAGE AREA, COBB COUNTY, GEORGIA--AMENDMENT TO ENVIRONMENTAL IMPACT STATEMENT, COBB COUNTY SEWERAGE IMPROVEMENT PROJECT, JULY 1971.
Environmental Protection Agency, Atlanta, Ga. Region IV.

Available from NTIS, Springfield, Va., 22151 EIS-GA-73-0626-F Price $6.00 printed copy; $1.45 microfiche. April 2, 1973. 368 p.

Descriptors: *Waste water treatment, *Treatment facilities, Water pollution control, *Sewerage treatment, *Georgia, Watershed management, Streams, Sewage effluents, Sanitary engineering, Water pollution sources, Water quality, Environmental effects, Pollution abatement.
Identifiers: Cobb County (Ga), *Sope Creek watershed (Ga), *Environmental Impact Statements.

This document is an amendment to the Environmental Impact Statement, Cobb County Sewerage Improvement Project, dated July 1971 (See W72-00649). The amendment provides additional information about the proposed interceptor sewer system's environmental impact on the Sope Creek watershed in Cobb County, Georgia, and elaborates on the steps that have been taken to preserve the historical and scenic aspects of Sope Creek. Sope Creek is located in a densely populated area of northeast Georgia in the eastern section of Cobb County about five miles from Atlanta. It originates within Marietta's city limits, travels generally eastward for about 10 miles, then turns abruptly southward for about two miles before joining the Chattahoochee River. About one-half of the land area of the drainage basin is urbanized. Development is largely residential with limited amount of commercial development. Cobb County's regional wastewater collection and treatment system includes seven major interceptor sewer contracts to transport waste water out of the Sope Creek basin to a major sewer along the Chattahoochee River, and thence down the river to a new treatment plant now under construction near Highway 3 at Bolton. Because of the industrial wastes, the treated effluent being discharged to Sope Creek by Marietta's East Side Plant had a BOD of approximately 200 mg/liter (roughly equivalent to normal raw domestic sewage). (Woodard-USGS)

EXTENDED AERATION IS NATURAL METHOD FOR EASY WASTE DISPOSAL,
E. Rees.
Process Engineering, p 81-82, August, 1972. 3 fig.

Descriptors: *Activated sludge, *Aeration, *Waste water treatment, Treatment facilities, Separation techniques, Water pollution control, Oxygen, Sludge, Sewage treatment, Municipal wastes, Automation, Biological treatment, Waste disposal.
Identifiers: *Bioactivator process.

Engineers have devised a very successful system within the last 15 years which combines both the concepts of the activated sludge principle as well as extended aeration. It is termed the Bioactivator process. Screened, but untreated water arrives tangentially at the periphery of a circular tank which has an outer annular aeration zone of long detention time. In this tank the water is constantly agitated in a rotary motion by a brush mechanical aeration system that transfers a predetermined volume of oxygen into the sewage. Thickened sludge at the bottom of the central settling zone is recirculated by a submersible pump to the outer annular aeration zone. All the equipment operations are fully automatic and can be carried out without supervision. (Smith-Texas)

REACTOR COOLING WATER FOR AGRO-INDUSTRIAL DEVELOPMENT,
Oregon State Univ., Corvallis. Dept. of Soil Science.
J. L. Boersma.
Available from the National Technical Information Service as PB-223 005, $3.00 in paper copy, $1.45 in microfiche. Oregon Water Resources Research Institute, Corvallis. Completion report, July 1973. 30 p, 15 fig, 3 tab, 7 ref. OWRR B-019-ORE (3) 14-01-0001-3323.

Descriptors: Thermal conductivity, Algae, Growth, Heated water, Soil temperature, Irrigation systems, *Oregon, Soil water, Water reuse.

Results of laboratory and field experiments are presented and analyzed. The effective thermal conductivity of soils is presented as a function of soil temerature, soil water content, and mineralogical composition. Differences between sandy soils and loam soils are indicative. Both laboratory and feild experiments show drying of the soil near the heat source to be a potential problem. It can be overcome by supplying water near the heat source with a subsurface irrigation system. Energy dissipation and temperature distribution are greatly enhanced by supplying water near the heat source with a subsurface irrigation system. During the summer a substantial fraction of the energy moves into the soil to depths below the heat source. During the winter most of the energy is discharged at the soil surface. Measurements indicated the effect on air temperature in a tall crop, such as corn, to be negligible. It is possible that on a large heated area some effect on air temperature might occur.

CATTLE FEEDLOT POLLUTION STUDY,
Texas Tech Univ., Lubbock. Water Resources Center.
D. M. Wells, E. A. Coleman, W. Grub, R. C. Albin, and G. F. Meenaghan.
Interim Report No. 1 to Texas Water Quality Board, November, 1969. 34 p, 6 fig, 11 tab.

Descriptors: *Cattle, *Feed lots, *Farm wastes, *Waste disposal, *Waste treatment, Runoff, Precipitation, Water pollution, Irrigation, Percolation, Waste storage, Ponds, Management, Biochemical oxygen demand, Nitrogen, Aerobic treatment, Anaerobic digestion, Field crops, Germination, Texas, Cattle.
Identifiers: Flushing.

Alternative feedlot management and waste disposal systems were evaluated and agronomic studies were conducted for the economic utilization or treatment of feedlot wastes. Both dirt and concrete-surfaced feedlots were used in a conventional manner. It was tentatively concluded that conventional aerobic treatment processes are not economically feasible solutions to the problem of treatment and disposal of cattle feedlot runoff resulting from natural precipitation; that runoff from feedlots operated in a conventional manner is not suitable for direct application as irrigation on most field crops; that anaerobic treatment processes offer the best hope for treatment of feedlot runoff; and that storage of feedlot runoff in unlined ponds and treatment and disposal of feedlot runoff on agricultural lands may pose a hazard to groundwater pollution. Recommendations were that further study be given to the possibility of changing feedlot practices to provide for daily flushing and treatment by conventional means; that the agronomic studies be continued to determine safe rates of application and safe dilution factors for selected crops; and that the infiltration studies be continued and expanded to include the analyses of cores taken in the vicinity of storage ponds and the construction and operation of deeper soil columns under field conditions. ACTIVATED SLUDGE AS A SOURCE OF PROTEIN,
Iowa State Univ., Ames. Dept. of Chemical Engineering.
A. S. Al-Zakri, and A. L. Frey
Paper No. 72-581, presented at 1972 Winter Meeting, American Society of Agricultural Engineers, Chicago, Illinois, December 11-15, 1972, 18 p, 3 tab, 19 ref.

Descriptors: *Activated sludge, Bacteria, *Proteins, Amino acids, Nitrogen, Iowa, *Sewage treatment, Freezethaw tests, *Extraction, E. coli, Recycling, *Waste treatment.
Identifiers: Bacillus megaterium, Biuret reaction.

Activated sludge from a municipal sewage treatment plant was extremely high in protein content. A clear solution obtained from settled activated sludge was frozen and then dried in an oven to yield a solid containing by weight 16.25% nitrogen. A purified protein form was derived through a complicated extracting process. This protein compared favorably with whole cow's milk in animo acid contents. Extraction methods involved are expensive, but another technique, treatment for bacterial breakdown as required with recycling to animals, is promising. (Frantz-East Central)

ANIMAL WASTE MANAGEMENT IN HAWAII,
Hawaii Univ., Honolulu. Dept. of Civil Engineering.
G. L. Dugan, R. H. F. Young, and G. Takamiya.
Journal Water Pollution Control Federation, Vol 45, No 4, p 742-750, April, 1973, 1 fig., 4 tab., 22 ref.

Descriptors: *Farm wastes, *Livestock, *Waste disposal, *Waste treatment, Air pollution, Water pollution, Goundwater pollution, Waste water treatment, Biochemical oxygen demand, Nitrogen, Ponds, Drying, Incineration, Recycling, *Hawaii.
Identifiers: Subtropical environment, Land spreading, Composting.

The unavailability of land suitable for accepting animal excrement near large animal raising facilities is a very critical problem in Hawaii. The problem is intensified by the pollution potential caused by the close proximity of land to the ocean. Various methods of managing animal waste ranging from land spreading to drying and incineration are discussed. A waste handling system that seems to be adaptable to a subtropical environment is a hydraulic recycling system incorporating photsynthetic reclamation. The process is based on hydraulic handling of animal excrement; gravity liquid-solids separation; aerobic biological treatment in which oxygenation can be accomplished either by the photosynthetic activity of algae or by mechanical aeration; anaerobic biological treatment; and harvesting algae from the aerobic phase, which provides the potential for nutrient recovery in the form of a high-protein animal feed supplement. CONFINEMENT. IN ARIZONA.

Calf News, Vol 11, No 3, p 52-53, 68-69, March, 1973.

Descriptors: *Farm management, *Farm wastes, *Confinement pens, *Feed lots, *Cattle, Effluent, Waste disposal, Irrigation system, Fertilizers, Alfalfa, Arizona.

Arlington Cattle Company decided to expand their Arizona feedlot operations through confinement housing in order to make manure management easier. The following advantages were listed for confinement housing: (1) more economical, (2) easier to handle animals, (3) better working conditions, (4) better management of mud, dust, odor, and flies, (5) a savings in manure handling of about $13,000 yearly. The manure system for the new facility will be scrapers running lenghwise under the slotted floor barns. Gravity will take the effluent to a pumping station which will move it to cropland where it merges with the flood irrigation system. Alfalfa will be grown on this property owned or controlled by Arlington Cattle Company. (Dudley-East Central)

SALMON THAT NEED NEVER SEE THE SEA,
Rhode Island Univ., Kingston.
T. L. Meade.
The American Fish Farmer, Vol 4, No 5, p 9-10, April, 1973, 3 fig.

Descriptors: *Recirculated water, *Salmon, Rhode Island.
Identifiers: *Controlled environment, *Toxic wastes, Denitrification column.

A system capable of raising salmon in a controlled environment was developed. Salmon were cultured in this controlled environment from incubation of eggs through the grow-out phase. This facility is outdoors and consists of four insulated silo-like tanks, 5 feet in diameter and 12 feet high. These tanks provide two separate culture units, each consisting of two tanks and associated biological filters, pumps, refrigeration, heating, and oxygen units. The system is essentially closed with continuous reuse of the water until the buildup of nitrate nears an unacceptable level. The results of these studies have seen incorporated in the design of a denitrification column which, when placed in operation, should eliminate the need to discharge water from the system. THE PRICE TAG TO STOP FEEDLOT RUN--OFF,

Beef, Vol 8, No 8, p 6-7, April, 1972, 4 tab.

Descriptors: *Farm wastes, *Waste disposal, *Feed lots, Settling basins, Lagoons, Irrigation, Nutrients, Runoff, Diversion structures, Terraces (Agricultural), Missouri, *Installation costs, *Operating costs, Cattle.

A Missouri engineer calculates the cost of a system to prevent feedlot run-off at $1,000 to $3,500 plus $300 to $600 yearly operation costs. His system consists of a diversion terrace to catch run-off, a settling basin to eliminate most solid waste in run-off, and a lagoon to hold run-off water. Irrigation equipment to pump run-off to adjacent farmland is included in the cost. Pumping rates vary and liquid may be distributed by gated pipe, hand carried sprinklers, or traveling Big Gun systems. The lagoon, ranging from 110,000 cubic feet upward, requires an earthen dam. Costs on all aspects of the system have been itemized in tables according to capacity lot sized from 200 to 1,200 head. (Frantz-East Central)

ODOR CONTROL MAY BE A BIG CONCERN,
Wisconsin Univ., Madison.
J. C. Converse.
Hoard's Dairyman, Vol 118, No 13, p 819, July 10, 1973.

Descriptors: *Odor, *Livestock, *Farm wastes, *Dairy industry, *Confinement pens, *Waste storage, Oxidation lagoons, Gases, Toxicity, Volatility, Aeration, Ventilation, Anaerobic bacteria.

Odors from cattle, feed, and manure are becoming a major problem for dairymen employing liquid manure pits with slotted floors or solid floor operations with manure scraped to openings in the floor. In a confinement system, anaerobic-facultative bacteria act upon the waste, resulting in odorous end products. Fixed gases and volatile organic intermediate odors, when improperly ventilated, produce discomfort not only for humans, but also for livestock. These gases, which may be measured on a chromatography, are irritants, asphyxiants, and flammable. There are no inexpensive methods of completely eliminating odors, but aeration devices, proper ventilation, and wise management reduce danger and discomfort. (Frantz-East Central)
W73-13844

LIQUID WASTE SEEPS FROM ONE BASIN TO ANOTHER.
Feedlot Management, Vol 13, No 6, p 56-57, June, 1971.

Descriptors: Aquifer, Cattle, *Farm wastes, Feed lots, Fertilizers, Irrigation systems, *Settling basins, *Lagoons, *Waste treatment, *Waste disposal, *Water pollution control, Nebraska.

In the waste handling system manure solids and liquids go into a 'debris basin' where solids settle to the bottom. The liquid passes through a rock-filled retaining wall, seeps through a median strip to the 'blackwater basin,' and is pumped back up hill onto land. It is then channeled through irrigation outlets to surrounding croplands where it seeps into the ground, gives up its plant food nutrients, goes to an underground aquifer, and eventually deposits pollution-free water into the Missouri River. Total cost of the feedlot, including the $400 per acre cost of the pollution control system (built with farm labor and equipment most farmers have available) amounted to $27,000-$27 per animal. (Hisle-East Central)

NEW ODOR CONTROL PROJECT.
Calf News, Vol 10, No 7, p 22, July, 1972.

Descriptors: *Odor, Waste disposal, *Feed lots, *Lagoons, Oxygen, Nitrogen, Phosphorus, Potassium, Ash, Cattle, *Farm wastes, *Air pollution, *Waste treatment, *Oklahoma.

A new product to control odor and reduce manure volume from feedlots is now being produced by RAD Limited, Inc., of Yale, Oklahoma. The product works on dead organic matter only; and in treated lagoons, no odor gases are produced. On the feedlots, dry solids are decomposed to nitrogen, phosphorus, potassium, and ash. Further tests will determine the proper amounts to be used to prevent a cracking problem which is now encountered in the lagoons. (Marquard-East Central)
W73-13846

OXIDATION DITCH IS CATTLE FEED SOURCE.
Beef, Vol 8, No 2, p 24, October, 1971.

Descriptors: Oxidation lagoons, *Feeds, *Effluent, Cattle, Aerobic bacteria, Proteins, *Waste treatment, *Recycling, Iowa.

Effluent from an oxidation ditch was used as a feed source. A feed acceptance test found that animals on the effluent ration consumed significantly more feed. The United States Department of Agriculture and the Food and Drug Administration found the carcasses acceptable but warned that further tests must be run before commercial operators can use the effluent as a feed source. One limiting factor has been the protein level: regular feed rations contain under 20% protein while this effluent contains 46.8% protein. (Marquard-East Central)
W73-13847

MONFORT LOOKS AT TREATED MANURE FOR TILE AND PLASTIC.
Calf News, Vol 10, No 8, p 4, August, 1972.

Descriptors: Feed lots, Plastics, *Tiles, Insulation, *Farm wastes, *Recycling, Waste disposal, *Waste treatment, *Ohio.
Identifiers: *Pyrolysis, Building materials.

Because future laws may restrict land application of feedlot manure, one feedlot has decided to use its wastes in a pyrolysis process to manufacture tile. While this will be the first commercial field test, laboratory results show that the product is superior to conventional tile. By using different proportions of manure and ground glass most building materials or insulation can be made. (Marquard-East Central)
W73-13848

CALIFORNIA WASTE PONDS ARE PASSING THE TEST,
M. L. Elam.
Hoard's Dairyman, Vol 118, No 5, p 311, 362, March 10, 1973, 3 fig.

Descriptors: *Irrigation storage ponds, Leaching, Effluent, Nitrates, Salts, Leakage, Pump, Recycling, Dairy industry, *California, *Waste water (Irrigation), Fertilizers, *Farm wastes.

Three California researchers have supported waste ponds as safe and legal means by which dairymen may eliminate waste drainage problems. It is doubtful if the use of waste ponds harms other water supplies. They have little odor and insect production. may be minimized. In a wide variety of soils tested, seepage and transfer of nitrogen and salts into soil were not problems. Farm wastes were easily applied to adjacent cropland. The researchers recommended the use of fifty gallons of water per cow each day and the partial emptying of waste ponds every four to six months. (Frantz-East Central)
W73-13849

SEWAGE SLUDGE INCORPORATION IN EXPERIMENTAL FIELD PLOTS TO EVALUATE HAZARDS AND BENEFITS, AND DEVELOP TECHNIQUES FOR OPTIMIZING BENEFITS AND MINIMIZE HAZARDS (FINAL ENVIRONMENTAL STATEMENT).
Agricultural Research Service, Washington, D.C.

Available from National Technical Information Service, U.S. Dept. of Commerce, as EIS-MD-72-5126-F, $3.00 paper copy, $1.45 microfiche. August 16, 1972. 13 p, 1 fig.

Descriptors: *Sludge disposal, *Maryland, *Environmental effects, *Sewage treatment, Sludge treatment, Agriculture, Water pollution sources, Waste disposal, Water quality control, Wastes, Groundwater, Sewage sludge, Sewage disposal.
Identifiers: *Environmental Impact Statements.

An experimental study of the feasibility of incorporating sewage sludge in agriculture land by a trench and cover method will be conducted. The area directly affected will be 4 acres of the Agricultural Research Center in Prince Georges County, Maryland. Approximately 1,200 dry weight tons of raw-limed or digested sewage sludge will be incorporated into the soil in a series of experimental plots designed to determine application rates and incorporation methods. The major

environmental impact of this study will be felt in the guidelines which the study will develop to provide maximum benefit and minimum hazard to the environment from the many millions of tons of sewage sludge which will be incorporated into soils in the future. Some odor may accompany the incorporated process, but this will be undetectable at the nearest habitation which is more than one half-mile distant. In addition, the proposed sludge incorporation and subsequent decomposition and leaching could possibly allow nitrates and pathogens into the groundwater below the plots. (Mockler-Florida)

PHENOL PLANT EFFLUENT TREATMENT,
BP Chemicals Limited, London (England). (assignee).
T. Bewley, M. D. Cooke, and M. M. Wirth.
U. S. Patent No. 3,746,639, 1 p, 3 ref; Official Gazette of the United States Patent Office, Vol 912, No 3, p 1058, July 17, 1973.

Descriptors: *Patents, *Waste water treatment, *Phenols, Pollution abatement, Sodium compounds, Water pollution control, Water quality control.
Identifiers: *Biocides, Sulphur dioxide, Sodium sulphite, Sodium bisulphite, Sodium sulphide, Sodium carbonate.

A process is described for the biodegradation of phenol plant liquid wastes. The wastes are treated with sulphur dioxide or a sulphur-containing compound prior to contacting the waste with an activated sludge biodegradation unit. Treatment of the waste with sulphur dioxide necessitates the addition of further alkali to neutralize the free acid remaining after partial neutralization by sodium carbonate contained in the waste. Removal of biocides from the waste by treatment with sulphur-containing compounds such as sodium sulphite, sodium bisulphite or sodium sulphide is thus preferred because further addition of alkali is avoided. (Sinha-OEIS)

DEVICE FOR AERATING LIQUIDS,
South African Inventions Development Corp., Pretoria. (assignee).
P. H. Huisman, and C. A. Jelier.
U.S. Patent No 3,744,774, 3 p, 11 fig, 11 ref; Official Gazette of the United States Patent Office, Vol 912, No 2, p 584, July 10, 1973.

Descriptors: *Patents, *Waste water treatment, *Aeration, Equipment, *Pollution abatement, Water quality control, Water pollution control.

A gas-liquid contact element consists of a rotatable disc having portruding formations on two faces transverse to its rotational axis adapted to draw air into a liquid during rotation when immersed in waste water. The protruding formations are nodules each having a convergent shape, converging in the direction of rotation. During rotation an air bubble is drawn into the liquid by the blunt base of each nodule. The nodule breaks up the air bubble into a number of smaller bubbles, whereby a larger contact area is formed between the air and the surrounding liquid and whereby absorption of the oxygen in the diffused air bubbles by the liquid is facilitated. BAFFLE WASTE TREATMENT TANK,
L. M. Ziegler.
U.S. Patent No 3,744,637, 5 p, 2 fig, 7 ref; Official Gazette of the United States Patent Office, Vol 912, No 2, p 550, July 10, 1973

Descriptors: *Patents, Equipment, *Aeration, Separation techniques, *Waste water treatment, Water pollution control, Pollution abatement, Water quality control, *Baffles
Identifiers: Clarification

A waste treatment tank has a baffle dividing it into an aeration and a clarification section. Air flow is introduced into the tank at the bottom of the baffle in the aeration section and at the top of the baffle in the clarification section. Aeration section air flow creates a circulatory mixture flow upward along the lower wall surface of the baffle. Air introduced into the clarification section skims sewage solids from that section and forces solids into the aeration tank section. (Sinha-OEIS)
W73-13975

PACKAGE SEWAGE TREATMENT PLANT,
H. E. Schlenz.
U.S. Patent No 3,744,634, 4 p, 3 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 912, No 2, p 550, July 10, 1973

Descriptors: *Patents, *Waste water treatment, *Aeration, *Sewage treatment, Pollution abatement, Activated sludge, *Irrigation water, *Water reuse, Equipment, Settling basins.

A settling tank is surrounded by an annular channel into which one or more motor driven, rotatable discs depend so as to aerate, agitate, and circulate sewage contained in the channel. An angularly adjustable trough is placed over the lower portion of one of the discs and is connected to an intermediate level in the settling tank. The disc and trough function as a pump to recirculate partially settled, activated sewage from the settling tank to the aeration channel. Water suitable for irrigation is removed from the surface of the liquid in the settling tank. (Sinha-OEIS)

OPTIMAL PROCEDURES FOR THE PROCESSING OF WASTE ACTIVATED SLUDGE,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Civil Engineering.
C. W. Randall, D. G. Parker, and A. Rivera-Cordero.
Available from the National Technical Information Service as PB-223 128, $3.75 in paper copy, $1.45 in microfiche. Virginia Water Resources Research Center Bulletin 61, August 1973, 86 p, 33 fig, 2 tab. OWRR A-035-VA (9).

Descriptors: *Activated sludge, *Dewatering, Anaerobic digestion, *Aerobic digestion, Compressibility, Filterability, *Waste water treatment, Chlorination, Waste treatment, Particle size, *Optimization.
Identifiers: Polymer conditioning, Aerobic storage, Anaerobic storage, Gravity dewatering, Sludge variation, Median particle size, Floc size.

An extensive study of changes that occur in waste activated sludge when it is processed by commonly used handling procedures and the effect of these changes on subsequent dewatering of the waste sludge is described. The purpose of the study was to identify the types of conditions that make activated sludge more difficult to dewater and to formulate procedures that would optimize dewatering. The principal handling procedures studied were: anaerobic storage, chlorination, aerobic digestion, polymer conditioning, and combinations of these techniques. The effects of operational parameters on the results were also studied. These include solids concentration, temperature, mixing, dissolved oxygen concentration, aeration rate, and digester flow conditions. Dewatering changes were measured by vacuum filterability, specific resistance, and compressibility. Mechanisms of dewaterability change were elucidated and found to be related to microbial viability and floc size. A procedure for measuring floc size was developed. Aerobic digestion was found to be a beneficial sludge conditioning technique, but it must be properly used or it, too, can be detrimental to dewatering.

BIOLOGICAL REMOVAL OF COLLOIDAL MATTER FROM WASTEWATER,
Minnesota Univ., Minneapolis.
W. J. Maier
Copy available from GPO Sup Doc as EP1 23/2 73-147, $2.35, microfiche from NTIS as PB 223 136, $1.45. Environmental Protection Agency, Technology Series Report EPA R2 73-147, June 1973. 166 p, 36 fig, 33 tab. EPA Project 17030 DGQ

Descriptors: *Wastewater treatment, *Biological treatment, *Biodegradation, *Microbial degradation, *Mass transfer, Membrane processes, Growth rates, Colloids, Enzymes
Identifiers: Biological removal, Organic colloid removal, Exoenzyme activity, *Film flow reactors

This research program was designed to provide a more basic understanding of the mechanism and rates of removal of organic materials from wastewaters by biological processes. Pure compound feed materials were used with the exception of a series of tests on sewage solids obtained from the Minneapolis-St. Paul Sewage Treatment Plant by centrifugation of primary effluent. Two model reactor systems were used to measure rates of substrate removal. The film flow reactor, characterized by a stationary biological slime layer, was used to study removal kinetics under conditions where mass transfer may be a limiting factor. A well mixed batch reactor was used to study rates of removal under conditions where biological processes are rate controlling. Rates of substrate degradation and carbon removal are reported for each of the pure compounds using acclimated innoculum. Rate data from batch reactors are expressed in terms of microbial growth rate coefficients. Rate data from the film flow reactor is reported as the quantity of substrate removed per unit of slime surface per unit of time. (EPA)

LAGOON PERFORMANCE AND THE STATE OF LAGOON TECHNOLOGY.
Ryckman, Edgerley, Tomlinson and Associates, Inc., St. Louis, Mo.

Copy available from GPO Sup Doc as EP1.23/2:73-144, $2.60; microfiche from NTIS as PB-223 129, $1.45. Environmental Protection Agency Technology Series Report EPA-R2-73-144, June 1973. 214 p, 23 fig, 10 tab, 60 ref. EPA Project 17090 FDO, 14-12-892, 68-01-0014.

Descriptors: Algae, Effluents, *Waste water treatment, Storage, Tertiary treatment, *Reviews, *Oxidation lagoons, Lagoons, *Municipal wastes.
Identifiers: Lagooning, *Lagoon treatment.

The phenomenal growth of oxidation lagoons as a form of municipal waste treatment is a reflection of their relatively low cost and ease of maintenance. The widespread acceptance of lagooning was originally predicated on their ability to produce effluent quality at least equivalent to accepted secondary treatment. In the semi-arid Great Plains states where lagoons were originally successful, such efficiencies were easily achieved for most of the year. Unfortunately, differences in climate (especially sunlight and rainfall), soil type, population density and a multitude of diverse problems have worked against such success for other portions of the country. Inventory and

operative data from municipal lagoon facilities have been collected and evaluated. The adequacy of such facilities to produce effluent to meet state water quality criteria for receiving waters has been evaluated. (EPA)

NITRATE REMOVAL BY ION EXCHANGE,
Negev Inst. for Arid Zone Research, Beersheba (Israel).
S. Evans.
Journal Water Pollution Control Federation, Vol 45, No 4, p 632-636, April 1973. 2 tab, 2 ref.

Descriptors: *Ion exchange, *Nitrates, *Demineralization, Water purification, *Lime, Slurries, Cations, Water quality control, Cost analysis, Costs, Municipal water, Water softening, Water chemistry, Dissolved solids, *Waste water treatment.
Identifiers: Israel.

A strong acid-weak base ion exchange system incorporating lime slurry regeneration was studied with Beersheva (Israel) tap water to which was added 70 mg/l nitrate (negative) as sodium nitrate. There was virtually no leakage of nitrate ion during the demineralization cycle and the subsequent softening cycle. A preliminary cost analysis, based on the experimental results yielded costs of 10 cents per thousand gallons, reflecting cost advantages associated with the use of lime. Along with nitrate removal, the process results in a product water that is markedly lower in total dissolved solids than the feed, can be adjusted by blending, and is free of undesirable cations. CLEAN WATER -- AT WHAT COST,
Organization.
A. W. J. Dyck.
American Paper Industry, Vol 54, No 5, p 10-14, May 1972. 2 illus, 3 fig, 3 tab.

Descriptors: *Treatment facilities, *Pulp and paper industry, *Pollution abatement, *Water pollution control, *Surveys, *United States, Water pollution treatment, Investment, Engineering structures, Waste water treatment.

A survey of current and planned water pollution abatement facilities at U.S. pulp and paper mills is summarized, based on questionnaires returned by 260 mills, that is, about 33% of all 767 U.S. paper mills, representing a combined output of 24,300,000 tons of paper and paperboard plus 7,000,000 tons of pulp yearly. Responses are grouped and discussed under three categories, viz., facilities installed between 1965 and 1971, those under construction in 1972, and those scheduled for startup between 1973 and 1978. In addition to giving a representative cross-section of paper industry efforts at pollution control, the findings should also indicate the potential market for pollution-abatement equipment. WASTE WATER PURIFICATION THROUGH CATALYTIC WET OXIDATION (ABWASSER-KLAERUNG DURCH KATALYTISCHE NASSOXYDATION).
Organization.

Allgemeine Papier-Rundschau, No 33, p 1199-1200, Aug. 21, 1972.

Descriptors: *Waste water treatment, Water pollution treatment, *Industrial wastes, *Catalysts, *Oxygenation, *Toxins, Pollutants, Oxidation, Granules, Oxygen, Thermocline, Temperature, Flocculation, Filtration, Sedimentation, Coagulation, Biodegradation, Europe, Foreign research.
Identifiers: *Katox process, Fluidized beds, Continuous processes, Germany.

The 'Katox' process was developed by the Krupp Co. particularly for the treatment of highly toxic industrial effluents which contain substances that resist conventional biological degradation. It involves essentially a multistage exposure of mechanically pretreated (sedimented) or chemically pretreated (coagulated) waste waters to a stream of oxygen in a constantly agitated bed of an undisclosed granular catalyst, followed by flocculation or filtration of the oxidized organic and inorganic pollutants. The process is said to be relatively insensitive to temperature fluctuations and to operate continuously without breakdown. (Brown-IPC)

STATUS OF WASTE PURIFICATION IN THE FINNISH PULP AND PAPER INDUSTRY (A CELULOZ-ES PAPIRIPARI SZENNYVIZTISZTITAS HELYETE FINNORSZAGBAN),
I. Tookos.
Papiripar, Vol 16, No 2, p 61-66, 1972. 4 fig, 3 tab.

Descriptors: *Treatment facilities, *Pulp wastes, *Waste water treatment, Europe, *Water consumption, Foreign research, Pollution abatement, Water pollution treatment, Pulp and paper industry, Industrial wastes, Industrial water.
Identifiers: *Finland.

Waste water treatment and pollution abatement facilities installed at five Finnish pulp, paper, and board mills are reviewed, along with pertinent industrial water use and effluent treatment studies being conducted at the Finnish Pulp and Paper Research Institute and the Swedish Water and Air Pollution Control Research Institute. Nearly two-thirds of all industrial and domestic water use in Finland is consumed by the pulp and paper industry. Only about one-third of all waste waters discharged by Finnish paper mills is being treated, largely by mechanical methods, but some progress with chemical and biological techniques is noted. RECYCLING CAUSTIC STAGE EXTRACTION WATER IN BLEACHING,
Stephen F. Austin State Coll., Nacogdoches, Tex.
L. F. Burkart.
Paper Trade Journal, Vol 156, No 36, p 33, Aug 28, 1972. 3 tab.

Descriptors: *Bleaching wastes, *Recirculated water, *Water reuse, *Color, *Waste water treatment, Pulp and paper industry, Lignins, Precipitation, Activated carbon, Effluents, Impaired water quality, Pulp wastes, *Recycling.
Identifiers: Bleach plants, Alkaline extraction, Decoloration.

Experiments are reported, in which the waste water (black water) from the alkaline extraction stage of a pulp bleach plant was recycled in order to study the effects of recycling on the quality of the bleached pulp and on the color or ease of decolorization of the resulting, more concentrated effluents. Results indicated that the pulp required no increased consumption of bleach to achieve the desired brightness, and that the lignin in the recycled alkali-extraction water is readily precipitated, leaving an amber-colored supernatant that can be further decolored with activated charcoal or bleach, if necessary. (Witt-IPC)
W73-14014

PURIFICATION OF WASTE WATERS OF THE FOREST PRODUCTS INDUSTRY, AS ILLUSTRATED BY EXAMPLES FROM SWISS MILL OPERATIONS (RENSING AV AVLOPSVANN I TREFOREDLINGSINDUSTRIEN BELYST VED EKSEMPLER FRA SVEITSISKE BEDRIFTER),
J. Negaard.
Norsk Skogindustri, Vol 26 No 6, p 144-148, 150-151, June 1972. 7 tab, 7 ref.

Descriptors: *Pulp wastes, *Waste water treatment, *Pollution abatement, Pulp and paper industry, Europe, Water pollution treatment, Biochemical oxygen demand, Effluents, Pollutants, Surveys, Byproducts, Costs, Operating costs, Operation and maintenance, Investment.
Identifiers: *Attisholz process, *Switzerland.

Of the twenty paper mills and fourteen board mills operating in Switzerland, eighteen returned a questionnaire about their effluent treatment practices. Investment and operating costs, as well as technical details of these installations are tabulated and discussed, including the characteristics of the various waste waters, the BOD removal effectiveness of different pollution abatement methods, and the recovery of byproducts. Special attention is paid to the 'Attisholz' effluent treatment process developed by Cellulose Attisholz AG. (Brown-IPC)

FLOTATION OF CELLULOSE FIBERS IN ALKALINE MEDIA (OTNOSNO FLOTATSIYATA NA TSELULOZNI VLAKNA V ALKALNA SREDA),
I. S. Monev, D. G. Dimitrov, L. L. Daskarev, and T. K. Zlatkova.
Tseluloza i Khartiya, Vol 3, No 3, p 28-31, May-June, 1972. 2 fig, 6 tab, 5 ref.

Descriptors: *Pulp wastes, *Waste water treatment, *Flotation, Additives, Fibers (Plant), Pulp and paper industry, Byproducts, Hydrogen ion concentration, Treatment facilities, Polymers, Operation and maintenance, Suspended solids.
Identifiers: Straw, *Bulgaria, Savealls, White water, Kraft mills.

Conventional flotation processes for removal of residual pulp fibers from paper machine white waters operate at pH 6.5 or below, and thus were unsuitable for the alkaline white water (pH 8) at the Miziya pulp mill (Bulgaria) which manufactures straw pulp. Sveen glue, polyimines, and related conventional flotation aids showed only about 45% flotation efficiency without addition of alum, the latter causing precipitation and co-flotation of dissolved lignin. Changes in the technological operation of flotation savealls were initiated, and three new flotation aids developed in Bulgaria were evaluated. These compounds, designated A, B, and V, of undisclosed composition, are cheap byproducts of other chemical industries and were found to be effective in alkaline media when added in a ratio of 1:200 based on the suspended fiber concentration which should be held between 0.2 and 0.5 g per liter. Other operating conditions recommended for best results include 2.5-3.0 atm pressure, pH adjustment to 8.0 or higher by adding milk of lime if need be, preliminary fiber recovery in hydrocyclones, installation of an ejector-type mixer between compressor and flotation saveall,

and addition of sodium sulfate when compound V or water of high hardness is used. (Stapinski-IPC)

NEW FLOTATION AIDS FOR CELLULOSIC FIBERS (NOVI FLOTOREAGENTI ZA TSELULOZNI VLAKNA),
D. G. Dimitrov, I. S. Monev, L. L. Daskalov, and T. K. Zlatkova.
Tseluloza i Khartiya (Sofia), Vol 3, No 2, p 16-19, March-April 1972. 6 tab.

Descriptors: *Waste water treatment, *Flotation, *Pulp wastes, Additives, Pulp and paper industry, Europe, Foreign research, Pollution control treatment, Hydrogen ion concentration, Pressure, Fibers (Plant), Suspended solids.
Identifiers: *Savealls, *Flotation aids, Bulgaria, Xanthates, Fiber recovery.

In most Bulgarian pulp and paper mills, fiber recovery from paper machine waste waters (white water) is performed in filtration or sedimentation units. At the Miziya Pulp and Paper Mill, a recently installed double-cell Sveen-Pedersen flotation saveall could not be operated effectively for lack of adequate flotation aids. Among several new chemicals developed for this purpose by the Bulgarian Pulp and Paper Institute (Sofia), two were found to be efficient flotation aids in acidic media. They are based on carboxymethyl xanthate (KMK-Ts) and sulfonylvinyl xanthate (SVK-Ts). When applied at recommended doses (minimum 0.3 g per liter) and under optimum conditions (pH 6.5 or less, 3 atm pressure), they performed as well as, or better than, two conventional preparations, viz., Sveen glue and isobutyl xanthate. (Stapinski-IPC)

ACTIVE ENVIRONMENTAL PROTECTION (AKTIVER UMWELTSCHUTZ).

Neue Verpackung, Vol 25, No 3, p 322, March 1972. 3 fig, 1 tab.

Descriptors: *Pulp wastes, *Waste water treatment, *Treatment facilities, Europe, Activated sludge, Biological treatment, Sedimentation, Coagulation, Flocculation, Water pollution treatment, Pulp and paper industry, Waste treatment, Industrial wastes, Effluents, Aeration, Storage capacity, Chlorination, Additives, Nutrients, Lime calcium compounds, Silica, Aerated basins.
Identifiers: Aluminum sufate, Aluminum compounds, Chlorine compounds, Thickeners, Board mills (Paperboard mills), *Germany, Raw material conservation.

A German paperboard mill operates a modern, two-stage waste water treatment plant which is described and illustrated. The first stage is conducted in a chemi-mechanical clarifier (Sedimat) of 2950 cu m volume which can theoretically handle up to 1000 cu m per hour of effluent in about 3 hr average residence time. The second, biological stage utilizes a 5800 cu m activated sludge basin (Biomat) capable of treating up to 700 cu m per hour of effluent in ca. 8 hr average dwell time. The two stages are followed by an aerated thickener which serves both to store the first-stage sludge sediment and to concentrate excess activated sludge. The latter is chlorinated to kill the microorganisms, and the residual solids (fibers and fillers) are returned to the mill's stock preparation for reuse in the paperboard furnish. Peripheral auxiliary equipment provides for dosing of aluminum sulfate, lime, silica, phosphorus and nitrogen nutrients, and chlorinated lime. (Speckhard-IPC)

Descriptors: *Pulp wastes, *Water pollution treatment, *Treatment facilities, Sulfite liquors, Pulp and paper industry, Europe, Effluents, Industrial wastes, *Waste water treatment, Biological treatment, Sedimentation, Costs, Economic justification, Investment, Biochemical oxygen demand, Bleaching wastes, Sludge disposal.
Identifiers: *Switzerland, Multistage processes.

A detailed illustrated description is given of effluent treatment facilities at the Cellulose Attisholz AG. sulfite pulp and paper mill in Switzerland. Aqueous mill discharges comprise three different components, namely, (1) cooling water, (2) fiber-carrying effluent from the stock preparation, pulp dewatering, and pulp screening rooms, and (3) organically loaded effluents from the sulfite digester, bleach plant, and spent liquor evaporator. The cooling water requires no treatment for pollution control. The fiber-bearing effluent is subjected mainly to sedimentation. The chemically loaded discharge is neutralized and then undergoes a two-stage biological purification. Laboratory studies leading to the development of the full-scale treatment facilities are outlined. The coasts of the treatment installation are high, but the investment has paid off in achieving a BOD reduction of 97.5 to 98.5%, although some problems of ultimate sludge disposal still remain to be solved. Descriptors: *Waste water treatment, *Industrial wastes, *Foam separation, *Disinfection, Bacteria, Coliform bacteria, Electrolysis, Oxygen, Oxygenation, Water quality, Waste treatment, Water reuse, Recirculated water, Flotation, Filtration, Suspended solids, Bituminous materials, Asphalt, Pulp wastes, Pulp and paper industry, Roofing materials, Sedimentation, Aquatic microorganisms, Ultraviolet radiation, Water pollution control, Water quality control.
Identifiers: USSR, Hypochlorites, Sodium hypochlorite.

The Kuibyshev Ruberoid Factory in the USSR, which manufactures asphalt-impregnated roofing felts, developed and installed relatively simple, low-cost equipment for effluent purification. A rotary filter separates and recovers suspended fibers. A conical sedimentor permits heavier-than-water particles to settle. Gas bubbles of nascent oxygen evolved in two continuously operating electrolytic flotators adhere to effluent particles, floating them to the surface. The resulting foam is skimmed off by drag conveyors and collected in receiving vessels. If sodium chloride is present in the effluent, bactericidal sodium hypochlorite is also formed electrolytically, resulting in substantial reductions of coliform bacterial counts and a decontaminating effectiveness of 50-60%. Subsequent passage of the purified effluent through chambers irradiated with ultraviolet light from mercury lamps achieves 95% decontamination, which meets Soviet quality standards for discharges into natural receiving waters as well as the factory's requirements for recirculation to reduce freshwater consumption. At electrode current densities of 10-18 milliamp per sq cm, a voltage of 6-12 v, and a flow rate of 8-10 cu m per hr, 96-98% of petroleum (bituminous) contaminants and 85-96% of mechanical impurities are removed from the effluents. (Stapinski-IPC)

USE OF ELECTRODIALYSIS FOR PROCESSING SPENT SULFITE LIQUORS (ISPOL'ZOVANIYE ELEKTRODIALIZA DLYA PERERABOTKI SUL'FITNYKH SHCHELOKOV),
Tsentralnyi Nauchno-Issledovatelskii Institut Bumagi, Moscow (USSR).
K. A. Veinov, and L. A. Mazitov.
Bumazhnaya Promyshlennost', No 5, p 7-9, May, 1972. 3 fig, 2 ref.

Descriptors: *Pulp wastes, *Waste water treatment, *Sulfite liquors, *Electrodialysis, Ion exchange, Kinetics, Energy, Electric power demand, Magnesium compounds, Efficiencies, Performance, Membrane processes, Lignins, Suspended solids, Temperature, Flow rates, Electric currents, Byproducts, Economic justification, Pulp and paper industry, Industrial wastes.
Identifiers: Lignosulfonic acids, Spent sulfite liquor, Chemical recovery.

Magnesium-base spent sulfite pulping liquors evaporated to different solids contents were electrodialyzed in an apparatus comprising two graphite electrodes plus cation-exchange, anion-exchange, and neutral membranes which divided the interelectrode space into five compartments. The liquor was introduced into the central compartment between a cation-exchange and a neutral membrane while the cathode- and anode-adjoining compartments were filled with sodium bisulfite and sulfuric acid, respectively. The process separated magnesium bisulfite, high-molecular and low-molecular lignosulfonic acids, and other organic acids. Operating variables studied included reaction rates, energy consumption, current density, magnesium oxide and total solids contents of the spent liquor, liquor flow rate, temperature, and chemical recovery efficiency. The energy consumption was found to depend on the current density, the temperature and concentration of the spent liquor, and the degree of magnesi-

ım oxide recovery. Power consumption could be reduced while improving the efficiency of the electrodialysis by conducting the process in several steps using different current densities. Since a part of the energy was consumed for recovery of mineral-free organic liquor components, a commercial market for these components would improve the economy of electrodialysis, render it more competitive with other effluent treatment methods, and justify the application of higher current densities. PURIFICATION EQUIPMENT AT THE IZMAIL MILL: OPERATING EXPERIENCE (OCHISTNYE SOORUZHENIYA NA IZMAIL'SKOM KOMBINATE: OPYT EKSPLUATATSII),
S. A. Perlov, and A. B. Isadskii.
Bumazhnaya Promyshlennost, No 4, p 10-12, April 1972. 2 fig, 2 tab.

Descriptors: *Waste water treatment, *Pulp wastes, *Sewage treatment, Foreign countries, Pulp and paper industry, Aeration, Biological treatment, Water pollution treatment, Rivers, Europe, Stream pollution, Waste disposal, Settling basins, Activated sludge, Sludge disposal, Ultimate disposal, Chlorination, Treatment facilities, Biochemical oxygen demand, Suspended solids, Sewage sludge, Fertilizers, Byproducts, Fermentation, Recycling, Effluents, Methane.
Identifiers: *Danube, Board mills, USSR.

Municipal sewage from the town of Izmail, Ukrainian SSR, near the Danubian Delta is treated jointly with effluents from the local bleached kraft pulp and board mill. In 1965, the mill installed equipment for mechanical and biological treatment of 42,000 liter per day of aqueous wastes containing 400 mg per liter of suspended solids and having a 5-day BOD of 200 mg per liter. Primary sedimentation in tanks removes about 60% of the solids and 30% of the BOD in 2.5 hr. Clarified effluent passes to an aeration tank of 8000 liter capacity where it is mixed with pre-aerated and sedimented sewage, while the sedimented sludge (containing mostly fine fibers) is recycled and reused along with waste paper in the manufacture of corrugated boxboard. Effluent from the activated sludge stage, which operates at 30% regeneration efficiency, contains 30 mg per liter of suspended solids and 10 mg per liter of five-day BOD. It is chlorinated before being discharged into the Danube. Sewage sludge from the primary sedimentation tanks is mixed with excess activated sludge and subjected jointly to methane fermentation, the product being used as fertilizer. (Stapinski-IPC)
W73-14035

WASTE WATER FROM FIBREBOARD MILLS,
G. Gran.
Pure and Applied Chemistry, Vol 29, p 299-321, 1972. 14 fig, 14 ref.

Descriptors: *Pulp wastes, Pollutants, *Recirculated water, *Water reuse, Effluents, Water pollution treatment, Industrial wastes, Pulp and paper industry, *Waste water treatment.
Identifiers: *Board mills (Paperboard mills).

Oxygen-consuming pollutants in the waste water (white water) discharged by paperboard mills include fibers and fiber fragments, bark particles, parenchymatous cells, wood-derived colloidal and soluble organic substances, and various water-soluble or insoluble chemicals added during board manufacture, such as alum, paraffin, fungicides, and synthetic resins. The effects of complete or partial closing of the water circuit on the total volume and concentration of contaminants in a board mill are discussed. Various methods for treating and disposing of highly polluted effluents are considered, notably evaporation plus combustion of evaporator residues, ponding, irrigation, aeration basins, and biological processes. (Witt-IPC)
W73-14036

MEASURES TAKEN AGAINST WATER POLLUTION IN THE KRAFT PULP AND PAPER INDUSTRY,
B. Hammar, and S. Rydholm.
Pure and Applied Chemistry, Vol 29, p 263-280, 1972. 1 tab.

Descriptors: *Pulp wastes, *Bleaching wastes, *Pollution abatement, *Waste water treatment, Pulp and paper industry, Technology, Biochemical oxygen demand, Industrial wastes, Pollutants, Water pollution treatment, Recirculated water, Air pollution, Costs, Oxygen.
Identifiers: Kraft mills, High yield pulping, Chemical recovery, Pulp washing, Black liquors.

After a historical review of the growth of the kraft pulp and paper industry, the pulping and papermaking operations of kraft or sulfate-process pulp mills are outlined and evaluated with regard to their water-polluting aspects. Among recent technological developments holding considerable promise of abating pollution are the trend toward higher-yield pulping processes, especially semichemical processes; improved pulpwood digesters combined with countercurrent pulp washers for increased recovery of black liquor; bleaching with oxygen, resulting in low-BOD bleach plant effluents, and water recirculation for fiber recovery and attendant reduction of suspended solids. Chemical recovery from black liquor via evaporation, combustion, and causticizing of the dissolved smelt is also dealt with, as is the control of air emissions from recovery furnace stacks. Methods for BOD removal from kraft mill effluents are still expensive and generally incomplete. (Witt-IPC)
W73-14037

ADAPTATION OF THE TTC TEST TO THE STUDY OF DEHYDROGENASE ACTIVITY OF ACTIVATED SLUDGE USED FOR THE PURIFICATION OF PULP MILL EFFLUENTS (PRZYSTOSOWANIE TESTU TTC DO BADANIA AKTYWNOSCI DEHYDROGENAZ OSADOW CZYNNYCH OCZYSZCZAJACYCH SCIEK I POCELULOZOWE),
K. Lelonkiewicz.
Prezeglad Papierniczy, Vol 28, No 7, p 215-219, July, 1972. 5 fig, 3 tab, 21 ref.

Descriptors: *Activated sludge, *Bioassay, *Colorimetry, *Monitoring, *Pulp wastes, Testing procedures, *Waste water treatment, Water pollution treatment, Enzymes, Incubation, Spectrophotometry, Solvents, Chemical reactions, Effluents, Biochemical oxygen demand, Organic loading, Waste treatment, Color reactions, Color, Analyitical techniques, Sludge digestion, Biological treatment, Foreign research, Europe.
Identifiers: Triphenyltetrazole (Triphenyltetrazolium chloride), Dehydrogenases, Poland.

Samples of activated sludge containing 1-4 g per liter of organic matter and capable of reducing effluent BOD values by 90-95% were subjected to the 2,3,5-triphenyltetrazole (TTC) test for dehydrogenase activity according to procedures recommended by Lenhard and Ford. (See also W73-12535). Even with prolonged incubation and concentrated samples, the formation of red triphenylformazan was inhibited by unknown factors at pH 8.4 and 37C. After studying the influence of TTC concentration, incubation time, spectrophotometer reading time, sludge concentration, type of solvent, and potential inhibitors, the following modifications of the TTC test are proposed: Removal of supernatant liquid above the sludge sample; use of 0.1% TTC plus 0.2% glucose for a 30 min sludge incubation time; extraction of formazan with technical-grade ethanol containing 3% benzene; and spectrophotometer readings to be taken not later than 1 hr after completion of the reaction. Following these recommended conditions should produce a formazan color of greater intensity and stability. (Stapinski-IPC)
W73-14038

PURIFICATION OF EFFLUENTS FROM THE MANUFACTURE OF CONSTRUCTIONAL FIBERBOARDS (BADANIA NAD UNIESZKODLIWIANIEM SCIEKOW Z PRODUKCJI PLYT PILSNIOWYCH),
J. Pajak.
Przeglad Papierniczy, Vol 28, No 6, p 195-197, June, 1972.

Descriptors: *Activated sludge, *Pulp wastes, *Waste water treatment, *Sewage treatment, *Sludge treatment, Sludge disposal, Effluents, Industrial wastes, Waste treatment, Europe, Foreign research, Coagulation, Sedimentation, Biological treatment, Fermentation, Aerobic treatment, Anaerobic digestion, Air pollution, Sewage districts, Lignins, Cellulose, Filtration, Aerated lagoons.
Identifiers: *Hemicellulose, Poland, Przemysl.

In 1971, the sewage district of Przemysl, Poland, began construction of a central installation for joint treatment of municipal and industrial wastes by the activated sludge process. Discharges from a factory manufacturing hardboards and related building boards posed a problem, in that the spent activated sludge tends to form a fine particulate suspension which is slow to sediment, difficult to filter, and hard to dewater. The consequent provision of a long-term sludge storage lagoon ca. 7 km from the city of Przemysl encountered criticism as giving rise to air-polluting putrefaction gases and to groundwater pollution by seepage. A two-year study of alternative sludge disposal methods, initiated by the Polish Fiberboard Industry Association, recommended the coagulative removal of cellulose, hemicellulose, and lignin from the board mill effluent prior to biological treatment. Since these contaminants are chiefly responsible for the difficult handling properties of spent activated sludge, their removal should enable the sludge to be subjected to conventional anaerobic fermentation, with fuel gas as a byproduct. An alternative treatment involving intense aeration and subsequent anaerobic fermentation was also deemed feasible, but less economical. (Stapinski-IPC)
W73-14039

ACTIVATED SLUDGE AND TRICKLING FILTER TREATMENT OF EFFLUENTS AT HALLSTA PAPER MILL,
T. Sundberg, and P-A. Wikstrom.
Svensk Papperstidning, Vol 75, No 11, p 433-438, June 15, 1972. 8 fig, 4 tab, 13 ref.

Descriptors: *Pulp wastes, *Waste water treatment, *Treatment facilities, Sulfite liquors, Biological treatment, Filtration, Filters, *Trickling filters, Biochemical oxygen demand, *Activated sludge, Operation and maintenance, Industrial wastes, Aeration, Pollution abatement, Organic loading, Mixing, Effluents, Efficiencies, Foreign countries, Europe.
Identifiers: Aerators, *Sweden, Newsprint mills, Sulfite mills, Malfunction, Chemical recovery.

At the Hallsta pulp and paper mill of Holmens Bruk AB., Sweden, the production of newsprint increased from 100,000 to 400,000 tons per year between 1959 and 1969, while the organic load of total discharged waste waters increased only from 4000 to 7000 tons of five-day BOD. With more efficient recovery of the spent sulfite liquor in 1970/1971, it became possible to decrease the BOD further below 5000 tons per year. The activated sludge treatment of newsprint mill waste waters reduced the seven-day BOD by 80 to 90% using a

loading of 3-4 kg per cu m of aerator volume per day, without disturbing the biological process. Trickling filters handling a load of 2 kg per cu m of filter volume reduced the seven-day BOD by 70 to 80%. The BOD reduction of sulfite mill wastes ranged from 40 to 70% in the activated sludge unit when loaded with less than 1.5 kg of seven-day BOD per cu m of aerator volume per day. Sludge bulking, that is, sludge with poor settling characteristics, was encountered several times. The trickling filter was easier to operate and caused only minor disturbances. At loads of 1.5 to 3.0 kg per cu m per day, in terms of seven-day BOD, it gave BOD reductions of 50 to 60%. Mixing of the sulfite pulp plus paper mill effluents gave slightly better results in the activated sludge unit and made no noticeable difference to the trickling filter. (Brown-IPC)
W73-14040

TREATMENT OF WASTE WATER FROM THE COTTON PROCESSING INDUSTRY (CISTENI ADPADNICH VOD Z BAVLNARSKYCH KOMBINATU),
H. Kavarikova.
Textil, Vol 27, No 6, p 209-211, 1972. 4 ref.

Descriptors: *Waste water treatment, Water pollution treatment, *Textiles, *Cotton, *Biological treatment, Biochemical oxygen demand, Color, Toxins, Pollutants, Industrial wastes, Water pollution sources, Municipal wastes, Economic feasibility, Coagulation, Iron compounds, Calcium compounds, Aluminum, Sludge treatment, Sludge disposal, Discharge (Water).
Identifiers: Aluminum compounds, *Chemical treatment.

A large cotton-processing textile factory discharges about 3000 to 6000 cu m of heavily polluted effluent waters daily. Chemical and biological methods suited for treatment of textile industry wastes are outlined and discussed with regard to their relative merits. Chemical methods which achieve about 40% reductions in effluent BOD include coagulation with iron, aluminum, or calcium salts or with calcium oxide. Biological methods achieve better BOD removals, but usually do not destroy color bodies, and pose problems in the removal of toxic components. Chemical and biological sludge dewatering methods and sludge disposal are also mentioned, along with economic considerations of treatment methods. Advantages claimed for joint municipal-industrial waste treatment are questioned. (Trubacek-IPC)
W73-14041

THE MUSKEGON COUNTY WASTEWATER MANAGEMENT SYSTEM.
Muskegon County Metropolitan Planning Commission, Mich.

Muskegon Area Industrial Expansion Commission, Muskegon, Michigan, 1972. 20 p.

Descriptors: *Water management (Applied), Water resources development, *Michigan, *Irrigated land, *Waste water treatment, Land management, Irrigation, Irrigation districts, Biological treatment, Soil amendments, Filtration, Agricultural engineering, Water treatment, Costs, Financing, Economics, Administration, Pulp and paper industry, Crop production, Sewage districts.
Identifiers: *Muskegon County (Mich).

The nearly closed system described and illustrated, approaching total water management, is unique in that it seeks, rather than shuns, effluents of high BOD loading and high solids content, as well as industrial wastes containing dyes or trace elements. The system is based on several widely used processes which are integrated for large-scale waste disposal. Essentially, waste waters from urban areas of the county, equivalent to a population of 157,000, are piped away from the shoreline to suitable locations inland where they are provided with the equivalent of conventional secondary waste treatment. After storage and disinfection, the nutrient-rich spray waters are irrigated on a variety of agricultural crops. Passage through the 'living filter' of the soil purifies the water before it is collected in an underdrainage system, monitored to assure that it meets drinking water standards, and discharged to the county's surface waters to augment low flows. Some detailed data are included regarding the composition of the waste water before and after treatment, the participants involved in the development and use of the system (a paper company, among others), the technologies utilized, and the costs and financing of the system. COAGULANTS AND FLOCCULANTS FOR THE PURIFICATION OF EFFLUENTS (KOAGULYANTY I FLOKULYANTYDLYA OCHISTKI STOCHNYKH VOD),
V. M. Shapchenko.
Bumazhnaya Promyshlennost', No 5, p 18-19, May, 1972. 1 tab.

Descriptors: *Pulp wastes, *Water pollution treatment, *Waste water treatment, Flocculation, Sedimentation, Coagulation, Polymers, Lime, Calcium compounds, Aluminum, Foreign research, Hydrogen ion concentration, Suspended solids, Pulp and paper industry.
Identifiers: *Aluminum sulfate, Aluminum compounds, *White water, USSR.

Experiments on the clarification of paper machine white waters were conducted at the First Leningrad Paper Mill, with the following results: Simple sedimentation was inadequate for removal of fiber and filler residues. Flocculants, such as polyacrylamide, polyethylene oxide, polyethylenimine, and Separan were ineffective without prior addition of coagulants. Satisfactory purification, namely, a Snellen transparency index of 15 to 35 cm and a residual suspended solids content of 1.8 to 15 mg per liter, was achieved by treating the white water with 25-50 mg per liter of aluminum sulfate, with or without lime for pH adjustment, followed 1 to 3 min later by addition of flocculant. (Stapinski-IPC)

USE OF REVERSE OSMOSIS AND ULTRAFILTRATION FOR THE PURIFICATION OF EFFLUENTS (PRIMENENIE METODOV OBRATNOGO OSMOSA I ULʹTRAFILʹTRATSII PRI OCHISTKE STOKOV),
Khimiko-Tekhnologicheskii Institut, Moscow (USSR).
Yu. I. Dytnerskii, A. A. Svittsov, Yu. K. Romanenko, Yu. N. Zhulin, and V. P. Semenov.
Bumazhnaya Promyshlennost', No 7, p 22-24, July 1972. 2 fig, 4 tab.

Descriptors: *Pulp wastes, *Waste water treatment, *Reverse osmosis, *Filtration, *Membrane processes, Pollution control treatment, Pressure, Dissolved solids, Salts, Effluents, Industrial wastes, Pulp and paper industry, Foreign research, Recirculated water, Water reuse.
Identifiers: Cellulose acetate, Ultrafiltration (or Pressure filtration), USSR, Condensates, Black liquors.

Black liquor evaporator condensates, raw mill effluents, and chemically or biologically pretreated aqueous wastes of the Baikal kraft pulp mill were subjected to reverse osmosis in comparison with ultrafiltration, using Soviet-made cellulose acetate membranes. Both methods of effluent treatment recovered water of sufficient purity for recycling as pulp mill process water. Ultrafiltration was found to operate more efficiently at relatively low pressures, i.e., 3 to 10 kg per sq cm, whereas reverse osmosis was superior in removing dissolved mineral compounds. (Stapinski-IPC)

SMALL TOWN WASTEWATER TREATMENT,
J. Neis.
Wisconsin Conservation Bulletin, Vol 38, No 4, p 12-12, July-Aug 1973. 2 illus.

Descriptors: *Wisconsin, *Legislation, *Financing, Government finance, *Waste water treatment, *Sewage treatment, Water quality control, *Federal Water Pollution Control Act, Municipal wastes, Loans, Sewage districts, Planning, Treatment facilities, Governments, State governments, Local governments, Federal government, Biological treatment, Pollution abatement, Water pollution control.

Typical examples are cited to show the benefits that have accrued to small townships and resort areas in Wisconsin through the financial aid provided for waste collection, water quality improvement, and sewage treatment facilities by (1) the ORAP-200 state legislative bill passed in April 1969, which allocates $144,000,000 for such purposes, (2) the October 1972 Amendments to the Federal Water Pollution Control Act which authorized further contributions to municipal sewage works, and (3) the new eligibility of many smaller communities for grants and low-interest loans through the Economic Development Agency, the Farmers Home Administration, and the Upper Lakes Regional Planning Commission. These financial boosts have encouraged local citizen groups and private landowners to join in the formation of cooperative sanitary districts to plan moderized or new biological treatment installations. TAPPI ENVIRONMENTAL CONFERENCE, 1972.
Technical Association of the Pulp and Paper Industry, Atlanta, Ga.

Proceedings of Meeting, Houston, Texas, May 14-17, 1972, TAPPI, Atlanta, Georgia, 1972. 202 p.

Descriptors: *Conferences, *Pollution abatement, *Pulp and paper industry, Air pollution, Water pollution, Effluents, Treatment, Industrial wastes, Industrial water, Ecology, Solid wastes, *Waste water treatment, Treatment facilities, Recycling, United States.
Identifiers: *Chemical recovery, Control systems.

This proceedings of a conference held in Houston, Texas, May 14-17, 1972, gives the unedited and unrefereed text of nineteen technical presentations by different authors. They deal largely with water and air pollution abatement, industrial effluent treatment processes, chemical recovery systems, recycling of process waters and of solid wastes, and related environmental concerns of the pulp and paper industry. RECYCLING FINE-PAPER MILL EFFLUENT BY MEANS OF PRESSURE FILTRATION,
Weyerhaeuser Co., Miquon, Pa.
W. S. Davis, R. S. Kraiman, J. W. Parker, and C. H. Thorborg.
In: TAPPI Environmental Conference, 1972, Proceedings of Meeting, Houston, Texas, May 14-17, 1972. TAPPI, Atlanta, Ga., p 63-73, 1972. 7 fig.

Descriptors: *Recycling, *Filtration, Filters, *Water reuse, *Waste water treatment, Pulp and paper industry, Water shortage, Industrial water, Freshwater, Treatment facilities, Equipment, Pressure, Slime, Color, Enzymes, Chlorine, Colloids, Lagoons, Coagulation, Sludge, Spring waters, Water wells, *Pennsylvania.
Identifiers: *White water, *Starch, Clarifiers, Paper machines, Amylase, Biocides, Fine papers, Printing papers, Writing papers, Sizing agents.

Five paper machines of Weyerhaeuser Co. at Miquon, Pennsylvania, are supplied with high-quality spring and well water the availability of which is diminishing. Improved production technologies and operating parameters enabled the mill to reduce its freshwater consumption from 4,400,000 gal per day in 1960 to 2,900,000 gal per day in 1969. A primary clarifier and a storage lagoon for chemically coagulated effluent sludge were installed to treat the machine waste water (white water). The need for further water conservation prompted the startup of a pressure filter to treat and recycle a portion of the clarifier effluent. Although the full-scale plant operated less efficiently than the pre-investigated pilot unit, further work is expected to cut freshwater needs by about 50%. Two major problems with the operation of the pressure filter are reported, namely, the presence of residual color in the filtrate from the manufacture of colored papers, and the formation of slime deposits in pipelines and storage tanks. Both of these problems were attributed to the dispersing action and colloidal effects of starch used as a surface sizing agent. The addition of an amylolytic enzyme plus a moderate does of chlorine solved the difficulties. (See also W73-14050) (Brown-IPC)

NEW LIME PROCESS FOR REMOVAL OF COLOR FROM KRAFT MILL EFFLUENT AT GEORGIA-PACIFIC WOODLAND, MAINE, MILL,
Georgia-Pacific Corp., Portland, Oreg.
M. Gould.
In: TAPPI Environmental Conference, 1972. Proceedings of Meeting, Houston, Texas. May 14-17, 1972. TAPPI, Atlanta, Ga., p 141-147, 1972. 1 fig, 3 tab.

Descriptors: *Lime, *Color, *Pulp wastes, *Bleaching wastes, *Waste water treatment, Effluents, Waste treatment, Treatment, Biochemical oxygen demand, Maintenance, Treatment facilities, Pulp and paper industry, Oregon, Dewatering, Sludge, Filters, Incineration, Solids contact processes, Industrial wastes.
Identifiers: Kraft mills, *Decoloration, Lime kilns, Chemical recovery, Kraft pulping, Clarifiers, Process variables, Alkaline extraction, Bleach plants.

The patented effluent decoloring process described involves treatment of the alkaline extraction stage waste waters from a kraft pulp bleach plant with approximately 2000 ppm of lime before entering a solids contact clarifier. The reaction of lime with color components in the waste water precipitates a settleable sludge which is continuously removed from the clarifier. The lime sludge underflow is then mixed with prefiltered lime mud and dewatered on a conventioanl belt filter. The dewatered sludge is fed directly into a lime kiln where the color bodies are burnt off and the lime is recovered for recycling. A full industrial treatment plant, which was installed after pilot plant trials, is described. The installation removes about 90% of the color and 45% of the biochemical oxygen demand from the mill effluent while recovering about 80% of the lime used. Indications are given of operating experiences with this process, including various process parameters, costs, and maintenance data, based on the first year of full-scale operation. REVERSE OSMOSIS CONCENTRATION OF SPENT LIQUOR SOLIDS IN PRESSATES FROM HIGH-DENSITY PULPS,
Institute of Paper Chemistry, Appleton, Wis. Div. of Industrial and Environmental Systems.
A. J. Wiley, K. Scharpf, I. Bansal, and D. Arps.
In: TAPPI Environmental Conference, 1972. Proceedings of Meeting, Houston, Texas, May 14-17, 1972. TAPPI, Atlanta, Ga., p 149-162, 1972. 2 fig, 6 tab, 6 ref.

Descriptors: *Reverse osmosis, *Waste water treatment, *Treatment facilities, Pulp and paper industry, *Pulp wastes, *Water reuse, Effluents, Treatment, Waste treatment, Biochemical oxygen demand, Chemical oxygen demand, Recycling, Wisconsin, Flow, Flow rates, Temperature, Hydrogen ion concentration, Membrance, Membrane processes, Colloids, Industrial water, Sulfite liquors, Water conservation, Equipment, Industrial wastes, Color.
Identifiers: NSSC pulping, Semichemical pulping, Presses, Process variables, Spent liquors, Wash waters, High-yield pulping, Polysaccharides, Continuous process, Decoloration, Solids content, Concentrating.

A reverse osmosis pilot unit at the Institute of Paper Chemistry (Appleton, Wis.) was used to concentrate dilute pulp wash waters obtained from a nearby pulp mill (Appleton Papers Inc., Combined Locks, Wis.) where a high-yield sodium sulfite semichemical pulp had been dewatered in a screw press. The dilute pressate required no elaborate pretreatment beyond nominal pH and temperature adjustments and removal of suspended solids through a 100-mesh screen. Decreasing flux rates, observed several hours after liquor collection, were attributed to the aging of feed liquor caused by hydration of polysaccharides and formation of gelatinous hydrocolloids in the first 24 hrs of operation. Reverse osmosis at elevated temperature, about 45 C, alleviated the problem of membrane fouling. Although the flux rates attained under the conditions of this field test were only 2.5 to 5.0 gal per sq ft per day, higher speeds of about 7.5 gal per sq ft per day are deemed possible for feed liquors less than one hour old to be concentrated from 0.5-1.0% to about 5-10% solids. Continuous operation of the reverse osmosis unit in conjunction with the screw press gave 90% or better recoveries of dissolved liquor solids and 78-80% reductions of five-day biochemical oxygen demand, chemical oxygen demand, and effluent color values. The clear water obtained was of sufficiently high quality to be recycled to the process stream of the pulp mill. (See also W73-14050) (Brown-IPC)
W73-14054

INDUSTRIAL LAND APPLICATION SPRAYFIELD DISPOSAL AND WILDLIFE MANAGEMENT CAN COEXIST,
Weston Paper and Mfg. Co., Terre Haute, Ind.
E. A. Guerri.
In: TAPPI Environmental Conference, 1972. Proceedings of Meeting Houston, Texas, May 14-17, 1972. TAPPI, Atlanta, Georgia, p 199-202, 1972.

Descriptors: *Irrigation, *Spraying, *Soil disposal fields, *Pulp wastes, *Waste water disposal, *Sulfite liquors, *Land management, *Indiana, Pulp and paper industry, Effluents, Ultimate disposal, Disposal, Waste disposal, Fish, Fish management, Wildlife, Wildlife management, Sodium compounds, Industrial wastes, Hardwood, Deciduous trees, Monitoring.
Identifiers: Spent liquors, Spent sulfite liquors, Semichemical pulping, NSSC pulping, Corrugating medium, Sulfite mills, Board mills.

Since 1961, the Terre Haute, Indiana, mill of Weston Paper and Manufacturing Co. has been producing corrugating medium (i.e., the fluting layer for corrugated boxboard) by pulping hardwoods according to the neutral sulfite semichemical (NSSC) process. The total sodium-base spent sulfite liquor, namely, 200,000 gal per day containing about 10% solids, has been disposed of by a spray irrigation system on noncultivated lands without any noticeable harmful effects on an adjoining fish and wildlife management area. Prerequisites for this continued practice include careful monitoring of soil parameters, observance of strict spraying schedules to avoid runoffs and ponding, and application of land rejuvenation procedures. A FEEDER LOOKS AT ANIMAL WASTE DISPOSAL,
Miller Feed Lot, Shepherd, Mont.
A. L. Miller.
In: Montana Agriculture - Focus on Improving the Environment, (Proceedings), College of Great Falls, December 3-4, 1970, p 44-46. (1970).

Descriptors: *Farm wastes, *Waste disposal, *Feed lots, *Fertilizers, Cattle, Nitrogen, Phosphorus, Silage, Missouri, Montana.

January 1, 1970, figures are given for the number and size of the nation's feedlots. The possibility of using animal wastes as a fertilizer is emphasized. The Miller Feed Lot analyzed its animal waste to see if it would be profitable as a fertilizer. Its value from the nitrogen phosphorus alone was about $1.00 to $3.00 per ton, so the company decided to sell the fertilizer to the farmers at not over 50 cents per ton. In order to do this quickly, a five yard capacity front-end wheel loader was used to stack the fetilizer in expanded pens and to load it on the farmers' trucks. (Hisle-East Central)

Paper No. 72-961, presented at 1972 Winter Meeting, American Society of Agricultural Engineers, Chicago, Illinois, December 11-15, 1972, 12 p, 5 fig, 1 tab, 6 ref.

Descriptors: *Farm wastes, *Waste disposal, Cattle, *Feed lots, Runoff, *Rates of application, *Irrigation, Corn (Field), Soil properties, Nitrogen, Phosphorus, Potassium, Sodium, Salinity.
Identifiers: Greensberg silty clay loam, Plant population, Forage yields.

A series of field plots were established to determine the influence of waste loading rates on corn forage yield and on soil properties. Separate field plots of Greensberg silty clay loam soil were established for disposal of runoff and manure. Runoff was applied to the land during the irrigation season; manure was spread after corn harvest and plowed under to a depth of 12 inches. Corn was surface planted on these plots with no pre-irrigation. Herbicides were used to control weeds, and irrigation water (from a well) supplemented runoff treatments and provided adequate moisture for the manure plots. The plants were counted to evaluate effects of treatments on population; the forage was weighed when ready for ensiling; and soil samples were taken at a depth of 10 feet, with additional samples at 3 feet in the manure plots, prior to corn planting, to assess decomposition of the manure. Conclusions were that corn plant population decreases linerily with increasing accumulated feedlot waste loadings; annual application of 10 inches of feedlot runoff gave maximum corn forage yields; and land disposal of feedlot wastes can lead to saline soil conditions and high nitrate-nitrogen concentrations in the soil profile. VARI-NIP PRESS SLUDGE DEWATERING AT CONTAINER CORPORATION OF AMERICA, FERNANDINA BEACH, FLORIDA,
Improved Machinery, Inc., Nashua,N.H.
H. C. Hunt, and C. E. Gustafson.
In: TAPPI Environmental Conference, 1972. Proceedings of Meeting, Houston, Texas, May 14-17, 1972. TAPPI, Atlanta, Ga., p 163-168, 1972. 4 fig.

Descriptors: *Sludge, *Dewatering, Equipment, *Treatment facilities, *Pulp wastes, Effluents, Pumps, Ventilation, Safety, Safety factors, Incineration, Pulp and paper industry, *Florida, Flow, Flow rates, Solid wastes, Solids contact processes, *Waste water treatment, Industrial wastes, Hydrogen sulfide disposal, Waste disposal.
Identifiers: Presses, Vari-Nip press, Clarifiers.

The 'Vari-Nip' twin-roll press manufactured by Improved Machinery Inc. (Nashua, N.H.), comprises essentially a pair of perforated rolls submersed to 60% in a pressurized, bottom-fed vat, one roll being stationary and the other rotating. The variable-gap press nip permits automatic compensation for fluctuations in flow rate and/or in the concentration of underflow solids discharged from the clarifier. A press of this design has been installed at a Florida pulp and paper mill of Container Corporation of America for the single-stage dewatering of sludge sediment from the primary clarifier treatment of mill effluents. The sludge is first freed of trash in a 'Solvo-Segra' pump and then dewatered in the Vari-Nip press to the 35% dryness required for ultimate incineration. Good ventilation by high-level fans is required for safe operation of the press in closed buildings, especially on warm humid days, in order to avoid buildups of evolved hydrogen sulfide gas. Cake discharge concentrations and production rates are discussed and shown graphically as functions of feed consistency, press roll speed, and pressing force or roll loading. WATER SUPPLY AND TREATMENT IN TWO REGIONS OF SAUDI ARABIA,
Wisconsin Univ., Milwaukee. Dept. of Energetics.
E. I. Shaheen.
Water and Sewage Works, Vol 120, No 4, p 84-89, May 1973. 6 fig.

Descriptors: *Water treatment, *Demineralization, *Water distribution (Applied), *Impaired water quality, *Brackish water, Water quality control, Water pollution treatment, Groundwater resources, Municipal water, Domestic water, *Desalination plants, Dissolved solids.
Identifiers: *Saudi Arabia.

The water systems in Riyadh and the eastern region of Saudi Arabia are dependent on groundwater resources with solids concentration averaging about 2500 mg/l. This is far above the acceptable 1500 mg/l standard. This salty water is unfit for drinking and many other domestic uses. To alleviate the problem, the government is developing a program to construct conventional water treatment plants, distribution nets, and a desalination plant. Riyadh's relatively sophisticated present water treatment system includes coolers, sedimentation, filtration, and chlorination, while that in the Eastern Province is direct chlorination. The quality of water there, however, is far better than that of Riyadh, in spite of the high concentration of dissolved solids. Details are given of the desalination plant being built on the Arabian Gulf, as well as the treatment and distribution of water in the Riyadh area. (Bahre-Arizona)

FLOW AUGMENTING EFFECTS OF ADDITIVES ON OPEN CHANNEL FLOWS,
Columbia Research Corp., Gaithersburg, Md.
C. Derick, and K. Logie.
Copy available from GPO Sup Doc as EP1.23/2:73-238, $1.00; microfiche from NTIS as PB-222 911, $1.45. Environmental Protection Agency Technology Series Report EPA-R2-73-238, June 1973. 74 p, 25 fig, 64 ref. EPA Project 11020 GQG. 68-01-0168.

Descriptors: *Polymers, *Open channels, *Flumes, *Fluid friction, *Water pollution control, *Weirs, Spillways, Combined sewers, Non-newtonian flow, Turbulent flow, Flow augmentation, Flow measurement, Flow profiles, Roughness, Slopes, Hydraulic jump, Reynolds number, Solutions.
Identifiers: Parshall flume, Leopold-lagco flume, Injected concentrations.

Two model open channel configurations (trapezoidal and rectangular) and three water soluble polymers (Polyox Coagulant, Polyox WSR-301, and Separan AP-30) were used to experimentally determine the effects of injecting dilute polymer solutions into open channel water flows. For all test cases, injection of the three polymer additives produced flow characteristic changes reflected as either a water surface level decrease at constant flow rates or a flow rate increase at constant static heads. These flow characteristic changes were dependent, in varying degrees, on channel slope, surface roughness, injection point location, polymer injection method, flow Reynolds number, and injected polymer concentration. In addition, two flumes (Parshall and Leopold-Lagco) and two model side channel spillways (90 deg V-notch weir and sharp-crested rectangular weir) were used to determine experimentally the effects of polymer additives on the flow measuring characteristics of energy dissipators. PROTECTION OF A UNIQUE ECOLOGICAL AREA THROUGH IMPROVED WATER AND FERTILITY MANAGEMENT,
Nebraska Univ., Lincoln. Dept. of Agricultural Engineering.
P. E. Fischbach.
Partial Technical Completion Report, June 1973. 6 p. OWRR A-031-NEB (1).

Descriptors: *Water quality control, *Fertilizers, *Return flow, *Nebraska, Irrigation practices, Water pollution control, Research and development.

Water and fertility management practices to maximize the efficiency of water use and minimize the nitrate pollution hazard related to intensive agricultural development on sandy soils are being studied. To determine the optimum amount and frequency of irrigation, three irrigation frequencies and four amounts of water will be applied to corn with an automated solid set sprinkler system. To compare the effectiveness of ground application of nitrogen fertilizer versus increment application through the systems, treatments will include applying all fertilizer by one or the other method and combination of methods. Water loss and leaching of nitrates will be studied over a range of conditions which may represent the extremes of management that would be practiced under irrigated agriculture in the Sand Hills. INVESTIGATION OF SINKING METHODS FOR REMOVAL OF OIL POLLUTION FROM WATER SURFACES; REPORT 3. TESTS AND EVALUATION OF OIL SINKING MATERIALS,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
B. J. Houston, E. C. Roshore, and V. D. Edgerton.
Available from NTIS, Springfield, Va 22151 as AD-750 853, Price $3.00 printed copy; $1.45 microfiche. Final Report (Report 3 of a Series), April 1972. 140 p, 5 plate, 17 tab, 11 ref, 7 append.

Descriptors: *Oil spills, *Oily water, *Water pollution treatment, *Submergence, Methodology, Sorption, Testing procedures, Chemicals, Physical properties, Specific gravity, Viscosity, Asbestos, Hydrates, Magnesium, Sands, Fly ash, Silica, Water quality control, Water pollution control.
Identifiers: *Oil sinking methods, Sinking materials, Chemically treated materials.

Materials were investigated that can be utilized in the cleanup of massive oil spills by sinking the oil. The program was divided into four phases: Phase I, Survey of the State-of-the-Art; Phase II, Development of Standard Test Procedures; Phase III, Tests of Sinking Materials; Phase IV, Tests Analysis and Conclusions. This report completes the program as funded and covers the results of Phases III and IV; it also recapitulates pertinent portions of Phases I and II, both of which have been previously reported. Twenty-three oil sinking materials, which had been located in Phase I, were screened and tested (Phase III) in accordance with applicable test methods developed in the Phase II study. On the basis of current information, these materials were evaluated (Phase IV) as dry-application sinking agents for oil. Factors such as cost, availability, effectiveness in sinking and retaining oil, and hazards to personnel and plant life were evaluated. Eight materials were identified as dry-application all-season sinking agents for one or more oils; nine materials were identified as dry-application provisional sinking agents for one or more oils. One material was identified as a dry-application all-season sinking agent for all of the oils tested; one material was a dry-application provisional sinking agent for all of the oils tested. PART I--MANAGEMENT OF WATER RESOURCES QUALITY. THE NATURAL QUALITY OF WATER RESOURCES,
Thames Conservancy, London (England).
H. Fish.
Effluent and Water Treatment Journal, Vol 17, No 11, p 585-594, 1972. 5 tab, 3 ref.

Descriptors: *Water resources, *Water quality standards, *Water quality, *Management, Water pollution control, Rainwater, Surface runoff, Surface water, Groundwater, Water analysis, Chemical properties, Physical properties, Estuaries.
Identifiers: United Kingdom, Coastal waters.

The natural quality of water resources is described. Apart from atmospheric pollution effects and atmospheric chemical reactions where pollution is considerable, the natural quality of rainfall is determined by seawater and dust uptake. Most natural surface runoff will be from areas of substantially impermeable rock, igneous and metamorphic rocks, and the clays. A typical runoff from peat or woodland areas would have a pH of 3 to 6, a color between 100 and 200 hazen units, and a COD between 20 and 60 with trace elements and sodium, calcium, magnesium, sulphate, and chloride contents similar to rainfall. Most groundwaters in the United Kingdom are usually clear and colorless, with temperatures between 10 and 14C and containing no significant flora or fauna; chalk groundwaters are naturally slightly alkaline. It is from surface runoff and groundwater springs that streams and ponds, rivers and lakes are naturally formed. Water quality in tidal waters (estuaries) is more complex than in coastal waters due to freshwater discharges. Chemical analyses, biological examinations, inspections on site, and physical factors must be studied for a baseline to assess changes by man and regulations necessary to prevent further damage of water resources. QUALITY GOALS FOR POTABLE WATER.

Journal of the American Water Works Association, p 62-65, October 1972, Part 2, 1 tab, 6 ref.

Descriptors: *Water quality standards, *Potable water, *Turbidity, *Organic matter, *Color, *Odor, Aluminum, *Taste, Manganese, Zinc, *Alkalinity, Hardness, Carbon compounds, Coliforms.

The AWWA Committee of Water Quality Goals was directed to set up realistic quality goals for the water industry that were to be more exacting than existing USPHS Drinking Water Standards with respect to aesthetic qualities. The goals were to be reviewed periodically and revised if warranted. Ideal water was defined to be clear, colorless, tasteless, and odorless. It should contain no pathogenic organisms and be free from objectionable biological forms. It should not contain harmful concentrations of chemicals. It should not be corrosive to, nor leave deposits on, water-conveying structures. The water should be adequately protected by processes that insure consistency in quality. Deleting items that primarily are the concern of health authorities, the Committee discussed water quality goals in terms of the following: turbidity, nonfilterable residue, macroscopic and nuisance organisms, color, odor, taste, aluminum, iron, manganese, copper, zinc, filterable residue, carbon-chloroform extract, carbon-alcohol extract, methylene-blue-active substances, hardness, alkalinity, coupon tests, coliform organisms, and gross beta activity. (Murphy-Texas)
W73-13785

USE OF RECLAIMED WASTE WATERS AS A PUBLIC WATER SUPPLY SOURCE.
American Water Works Association, New York.

Journal of the American Water Works Association, Part 2, p 66, October 1972.

Descriptors: *Water reuse, *Waste water treatment, Effluent, Reclamation, Artificial recharge, Drinking water, Research and development.

The American Water Works Association expressed its belief that the full potential of reclaimed water as a resource should be exploited as rapidly as scientific knowledge and technology will allow. However, noting the increase in planned direct reuse of reclaimed waters, the Association was of the opinion that current knowledge and technology are not sufficiently advanced to permit direct use of treated waste waters as a source of public water supply. It urged and outlined a plan for intensive research and development by the AWWA Research Foundation and the Water Hygiene Division of the Office of Water Programs in the Environmental Protection Agency to advance technological capability in waste water reclamation. ANIMAL WASTE DISPOSAL,
Montana State Dept. of Health, Helena. Div. of Environmental Sanitation.
C. W. Brinck.
In: Montana Agriculture - Focus on Improving the Environment, (Proceedings), College of Great Falls, December 3-4, 1970, p 41-43. (1970).

Descriptors: *Water law, *Regulation, *Permits, *Feed lots, Waste disposal, Waste treatment, Water pollution control, Cattle, *Montana.

Montana water pollution laws are traced from 1907 through the 1970 regulation attempt to require feedlot location permits by 1973. Permits are to be issued on the basis of proximity of the feedlot to its neighbors, the possibility of odors being carried toward urban areas, fly problems, prevention of drainage to streams, the pollution of underground water and the potential for good feedlot maintenance. Permits will be required for all new construction. For existing feedlots, it is proposed that a permit be required for any feedlot located closer than one mile to the boundary of an incorporated city or town within one year after passage of the regulation. DO YOU HAVE TO MOVE 'EM OR CAN YOU LEAVE 'EM,
Agricultural Research Service, Lincoln, Nebr.
N. Swanson.
Nebraska Farmer, p 13, 15, February 3, 1973, 1 fig.

Descriptors: *Feed lots, Runoff, *Waste storage, *Waste disposal, *Water pollution control, *Irrigation systems, Flood protection, Dikes, Sumps, Basins, Nebraska, Cattle.
Identifiers: SCS Rural Environmental Assistance Program.

By using help from government agencies, it is possible to control runoff from feed lots which previously might have had to relocate. As an example, the Soil Conservation Service and agricultural engineers developed a dike system for a problem feedlot on the banks of a stream. The dike prevents runoff and floods and provides weather protection for the cattle. A basin collects the runoff which is then pumped into a sump and then the water is disposed of by irrigation. The solids are spread across the top and slopes of broad-basin terraces or mounded in the feedlot. (Marquard-East Central)

ANIMAL WASTE DISPOSAL,
Connecticut Agricultural Experiment Station. New Haven Dept. of Soil and Water.
C. R. Frink.
Compost Science, p 14-15, November-December. 7 ref.

Descriptors: *Farm wastes, *Waste disposal, Water pollution, Nitrates, Nutrients, Sewage treatment, *Fertilizers, *Farm practices.

Recent data show that manure applied to field crops does not improve yields enough to offset the cost of hauling and spreading. Alternatives are (1) stop producing manure, (2) hide it on the 'back forty,' or (3) place it in a sewage treatment plant. These are not acceptable because we need the food produced by the animals, 'hiding it' may contaminate drinking water, and sewage treatment is too expensive. With alternative methods exhausted, the data must be re-examined for application of manure to field crops. Studies indicate that improved agronomic practices will increase the efficiency of nitrogen utilization and reduce the total nitrogen imparted on the farm. It is also suggested that, when feasible, animal wastes be applied to forest lands. (Marquard-East Central)
W73-13829

SEEPAGE LOSSES AND FERTILIZER PRESERVATION IN MANURE STACKING PRACTICE,
Wisconsin Univ., Madison. Dept. of Agricultural Engineering.
T. S. Hsu, C. O. Cramer, and J. C. Converse.
American Society of Agricultural Engineers, Paper No. 72-442, 1972. 23p, 8 tab, 11 fig., 15 ref.

Descriptors: *Seepage, *Farm wastes, Cattle, *Solid wastes, Organic matter, *Nutrients, Nitrogen, Physical properties, Chemical properties, Volatility, Degradation (Decomposition), Dairy, *Waste disposal, *Waste storage, Wisconsin, Biochemical oxygen demand, Chemical oxygen demand
Identifiers: *Manure stacking, Bedding, Steam distillation method

A model study of manure stacking using a 3x3 factorial design with two replicates was conducted to determine the effect of type and amount of bedding on seepage losses, manure degradation and volumes. Corn stalks and oat straw were utilized in the experiment at 3 levels: (1) the control (no bedding), (2) the addition of 1.5 lb. of bedding material per 60 lb of fresh manure, and (3) the addition of 3.0 lb. of bedding material per 60 lb of fresh manure. The following conclusions were reached: the addition of bedding material to fresh manure decreases the losses of organic matter, solids, and nutrients in the seepage from the manure stacks; corn stalks significantly reduce the losses of seepage and nitrogen, COD, BOD, and solids in the seepage while oat straw does not; a high percentage of organic matter, nutrients and solids are preserved in the stacks; and higher quantities of BOD5, COD, solids, and nutrients were lost in the seepage from the stacks with a lower level of treatment before the freezing period and immediately after the spring thaw. Experimental procedures and results are outlined. (Dudley-East Central)
W73-13831

MOVE TO NEW LOCATION SOLVES MANY PROBLEMS FOR CUSTOM FEEDER,
E. W. Manthey.
Feedlot Management, Vol 13, No 8, p 34-44, August, 1971.

Descriptors: *Relocation, *Farm wastes, *Feed lots, Arizona, Cattle.
Identifiers: Retention pond, Fly parasites, Biological fly control, Preconditioning, Feeding out and finishing.

Ecology and odor complaints from residents living near the Phoneix stockyards plus the problem of disposing economically of cattle wastes in an urban area were only two of the reasons why the Producers Livestock Marketing Association built a new feedlot of Maricopa. Another factor was plentiful nearby farmland which could absorb cattle-produced wastes in the new location at a fair return. The new feedlot was graded to include an anti-pollution pond for bacterial and anaerobic breakdown of animal wastes and for retention of the effluent on the land. A detailed description of the construction of the feedlot is given. Both the feeding out and finishing cattle process, and the preconditioning of stockers and feeders are discussed. Gnats (2 or 3 kinds that come from Africa) are used for biological fly control. (Dudley-East Central)

ECONOMICS OF WATER POLLUTION CONTROL,
Economic Research Service, Washington, D.C.
J. P. Biniek.
In: Frontiers in Conservation, Proceedings, 24th Annual Meeting, Soil Conservation Society of America, Colorado State University, Fort Collins, August 10-13, 1969, p 102-106 (1969) 1 tab., 10 ref.

Descriptors: *Pollution, *Water pollution, *Economics, Herbicides, *Water pollution control, Animal wastes, Waste disposal, Livestock, Feed lots, Runoff, Waste treatment, Percolation, *Management.

In broad, general terms many problems in the economic area of pollution control are discussed. Pollution is defined as 'the unfavorable alteration

of our surroundings, wholly or largely as a by-product of man's action.' Many means of ridding ourselves of pollutants often result in further pollution. The difficulty of securing a balance between production needs and the externalities of economics (the beneficial) and diseconomies (the harmful) is discussed along with the costs of pollution control, the economics of agricultural pollution and the role of economics as a whole. HOW MUCH MANURE PER ACRE.
E. D. Anderson.
The Farm Quarterly, Vol 27, No 5, p 44-45, Fall, 1972, 2 tab.

Descriptors: *Farm wastes, *Waste disposal, Hogs, Cattle, *Cycling nutrients, *Fertilizers, Groundwater pollution, *Legal aspects, Nitrates, Productivity, Potassium, Phosphorus, Regulation, Toxicity.

The laws of many states reflect concern over the harmful effects of manure on soil and water. Specific regulations for Kansas, Missouri, and Indiana are discussed. Concern is also reflected in university studies. One study was conducted at Michigan State University to determine a feasible rate of manure application. Manure applications at rates of 10, 20, and 30 tons per acre were made annually from 1963 to 1971 to Conover-Hodunk loam and Metea sandy loam. Soil samples were taken, corn yields were recorded, and mineral analyses of the corn were made. The optimum rate for applying manure to sandy loam was 10 tons per acre. Higher rates posed the hazard of nitrate contamination of ground water and buildup of available nitrogen and potassium. (Dudley-East Central)
W73-13850

FLY CONTROL AND CHRONIC TOXICITY FROM FEEDING DURSBAN (0,0-DIETHYL 0-3, 5, 6-TRICHLORO-2-PYRIDYL PHOSPHOROTHIOATE) TO LAYING HENS,
Hawaii Univ., Honolulu. Coll. of Tropical Agriculture.
M. Sherman, and R. B. Herrick.
Poultry Science, Vol 52, No 2, p 741-747, March, 1973, 3 tab, 3 fig, 12 ref.

Descriptors: *Pesticide toxicity, *Farm wastes, *Poultry, Larvae, Feeds, Additives.
Identifiers: Dursban, *Fly control.

The effects of administering technical Dursban at concentration of 25, 50, and 200 ppm in the feed of laying hens were studied over a 52 week period. The estimated mean daily intake of Dursban was 2.48, 5.12, and 20.44 mg. per hen for those receiving 25, 50, and 200 ppm, respectively. Dursban at 50 ppm resulted in excellent control of larvae of Musca domestica L., Fannia pusio (Wiedemann), Chrysomya megacephala (F.), and Boettcherisca peregrina (Robineau-Desvoidy) but only moderate control of Parasarcophaga argyrostoma (Robineau-Desvoidy). No hen mortality occurred that could be attributed to the insecticidal treatment. There was a direct relationship between Dursban concentration and blood plasma cholinesterase inhibition. However, overall feed consumption, body weight, egg production, feed efficiency, egg weight, interior egg quality, and shell thickness were normal. Eggs from treated hens had no detectable off-flavors or off-odors. (East Central)

THE WETLANDS STATUTES: REGULATION OR TAKING,
W. Welsh.

Descriptors: *Land use, *Zoning, *Wetlands, *Estuaries, *Legislation, Legal aspects, Environmental effects, Coastal marshes, Tidal marshes, Aquatic environment, Wildlife conservation, Water quality, Constitutional law, Flood plain zoning, Land management, Land development, Connecticut, Permits, Coasts.
Identifiers: Inverse condemnation.

Public concern has precipitated legislation in many states to regulate the activities landowners can pursue in the use of marshland areas. These statutes provide restrictions or permit requirements for endeavors such as draining, dredging, excavation, and the filling and erection of structures. The 'taking' issue raised by the Connecticut wetlands statute is discussed. Consideration is given to the statutory approach of other states to wetlands regulations, the 'taking' issue under those statutes, and the resultant judicial disposition. The importance of wetlands is discussed; it is pointed out that the extraordinary fertility of coastal wetlands is the key to the biological value of an estuary. Since population in coastal regions is increasing, the manifold forces acting on the delicate natural balance of estuaries exigently require the regulation of activities in wetland areas. (Mockler-Florida)
W73-13859

THE REFUSE ACT OF 1899: ITS SCOPE AND ROLE IN CONTROL OF WATER POLLUTION,
D. D. Eames.
Ecology Law Quarterly, Vol 1, No 1, p 173-302, Winter 1971. 200 ref.

Descriptors: *Rivers and Harbors Act, *Legislation, *Law enforcement, *Water Quality Act, Water quality control, Water quality standards, Legal aspects, Water conservation, Judicial decisions, Water pollution control, Federal Water Pollution Act, Federal government, State governments, Navigable waters, Waste disposal, Permits, Remedies, Penalties (Legal).
Identifiers: *Refuse Act, Administrative regulations, Army Corps of Engineers, National Environmental Policy Act, Fish and Wildlife Conservation Act, Citizen suits.

Due to inadequacies in federal water pollution control law, the government has been turning more and more to the Refuse Act to presecute water polluters. The scope of the act is defined through examination of its legislative, judical, and administrative history. Possible modes of action and remedies available under it are explored. Use of the Refuse Act as a complement to existing federal water quality legislation will contribute to attainment of the goal of comprehensive and effective control of water pollution. The simplicity of the Refuse Act's enforcement procedures, that is, its blanket prohibition on waste discharges, offers strength but ignores the complexities involved in pollution control. If however, the Refuse Act is integrated into the scheme provided by the Water Quality Act, the faults of both statutes are partially ameliorated. In effect, use of the Refuse Act in cases of emergency and of violation of effluent standards puts teeth into the enforcement provisions of the Water Quality Act and extends the scope of modern legislation. (Mockler-Florida)

LEGISLATIVE RESPONSES TO AIR AND WATER POLLUTION,
W. B. Lowman.
Ohio State Law Journal, Vol 33, p 860-897, 1972. 1 tab, 242 ref.

Descriptors: *Legislation, *Pollution abatement, *Water pollution control, *Air pollution, Air environment, Public health, Legal aspects, Water pollution sources, Water quality control, Law enforcement, Water Quality Act, Legislation, International commissions, Taxes, State governments, Treatment facilities.

Present efforts to control air and water pollution are inadequate and reflect a lack of appreciation for the seriousness of the problems and the ways to solve it. The governmental response is little more than political busywork to quiet the restless. A mobilization of research, technical, and political facilities to forestall the impending environmental crisis. The pollution problem in the beginning, the problems that exist today, and what will no doubt occur in the future unless positive action is taken are described. The various control efforts available, the costs of such programs, and why many state and federal programs already enacted have failed are also discussed. International attempts to curb water and air pollution are examined and the unsolved problems are pointed out, the most glaring of which is the lack of essential intra and intergovernment cooperation and coordination. Also, the lack of enlightened anticipatory control over future pollution sources is discussed. Tax incentives to encourage the construction of pollution control devices is also discussed from the state and federal perspective. (Mockler-Florida)
W73-13864

AN EXAMINATION OF THE FEDERAL WATER POLLUTION CONTROL ACT AMENDMENTS OF 1972,
Washington and Lee Univ., Lexington Va.
A. N. McThenia, and L. G. Cohen.
Washington and Lee Law Review, Vol 30, p 195-222, Summer 1973. 133 ref.

Descriptors: *Federal Water Pollution Control Act, *Legislation, *Pollution abatement, *Waste treatment, Water Quality Act, Waste assimilative capacity, Water capacity standards, Industrial wastes, Municipal wastes, Federal government, Permits, Governmental interrelations, Grants, Treatment facilities, Law enforcement, Penalties (Legal), Waste disposal.
Identifiers: *Effluent limitation, Effluent charges, Refuse Act of 1899, Non-point sources (Pollution).

The Federal Water Pollution Control Act of 1972 (FWPCA) is the most far reaching attack on water pollution ever undertaken in this country. The national water pollution control effort prior to this Act under the Water Quality Act of 1965, the Clean Water Restoration Act and the Refuse Act has proven to be a failure due to inter alia, federal-state bickering and administrative problems. The FWPCA of 1972 calls for the elimination of all pollutant discharges into navigable waters by 1985. Utilizing effluent limitations, the Act sets different standards for industrial dischargers and for municipal waste treatment plants. However, the concept of receiving stream standards retained in order to constitute a floor level of water quality. A national system of discharge permits patterned

after the 1899 Refuse Act permit program will be implemented to insure achievement of these levels of control. A brief discussion of the enforcement provisions, the provisions dealing with construction grant assistance and the federal-state relationship within the Act is included. The FWPCA of 1972 has set a policy that the nation's waters are no longer to be available for waste disposal. This goal can be achieved with diligent efforts. (Brackins-Florida)

OIL POLLUTION AND THE BRUSSELS CONVENTION,
J. J. Higgins.
ABA Section of Insurance, Negligence, and Compensation Law, Proceedings 1971. 6 p.

Descriptors: *Oil spills, *Damages, *Compensation, *International waters, *International law, Water pollution sources, Disasters, Water pollution, Oil wastes, Oil pollution, Water law, Legal aspects, Oil, International commissions, Oil industries, Treaties, Negligence.
Identifiers: Brussels Convention of 1969.

The destruction caused by spills of huge amounts of oil from large tankers led to the International Convention on Civil Liability for Oil Pollution Damage in Brussels in 1969. Prior to the Brussels Convention, there was little international regulation of oil pollution. A 1954 Convention in London had established zones in which the discharge of oil was prohibited and prescribed certain other regulations. Acceptance of this convention was slow, and really didn't cover problems of prosecution and civil liability. The Brussels Convention is designed to compensate persons who have suffered damages on the territory of a contracting state caused by pollution resulting from the escape or discharge of oil from vessels, as well as to provide for reimbursement of the costs of preventive measures taken by anyone to prevent oil pollution damage and clean up costs incurred by any government. A Supplementary Convention planned for 1971 will discuss compensation for pollution damage not covered by the 1969 Convention. (Glickman-Florida)
W73-13866

STATE LEGISLATION CONCERNING MARINE POLLUTION FROM VESSELS,
G. W. Paulsen.
ABA Section of Insurance, Negligence, and Compensation, Proceedings 1971. 5 p, 6 ref.

Descriptors: *Legislation, *Ships, *Water quality control, *Governmental interrelations, Oil spills, Water pollution sources, Regulation, Legal aspects, Constitutional law, Water law, Navigable waters, Water quality standards, Water quality, Political aspects, State jurisdiction.
Identifiers: *Federal Water Quality Improvement Act, Admiralty.

In spite of the passage of the Federal Water Quality Improvement Act of 1970 (FWQIA) various states are considering similar legislation, creating problems for the mari-time industry and their insurance underwriters. While the federal government should have exclusive jurisdiction to enact legislation under the admiralty clause of the Constitution, states contend that they are authorized by the police power and a clause in the FWQIA. The constitutionality of these state statutes is now being tested in the courts. The statutes vary, some dealing only with oil spills, others with sewage and other hazardous substances. Some provide for strict liability of the offender, and others limited liability. Some states prohibit vessels which do not comply with their regulations from using their ports. Many of the state provisions conflict with the federal legislation. Technology should be used to keep the waters clean; civil liability and insurance should not be misused to do so. The solution to the problem calls for an international convention. (Glickman-Florida)

PROGRESS REPORT ON AQUATIC WEED AND ALGAE CONTROL STUDIES,
Bureau of Reclamation, Denver, Colo. Engineering and Research Center.
N. E. Otto, P. M. Turner, and V. S. Miyahara.
Available from the National Technical Information Service as PB-214 643, $4.50 in paper copy, $1.45 in microfiche. Report REC-ERC-72-35, October 1972. 67 p. 5 fig, 16 tab, 14 ref, 3 append.

Descriptors: *Herbicides, *Pesticide residues, Evaluation, *Algicides, *Phytotoxicity, Chlorophyta, Aquatic weed control, Algal control, Cyanophyta, Carbon, Nitrogen, Phosphorus, Pondweeds, Sago pondweed, Irrigation canals, Soils, Microorganisms, Bicarbonates, Alkalinity, Productivity, Submerged plants, Emulsifiers.
Identifiers: Rhizoclonium, Phormidium ambiguum, Carter Lake (Colo.), Elodea canadensis, Potamogeton crispus, South Platte (Colo.).

Aquatic weed control studies conducted during 1970 and 1971 included pesticide evaluation, rela-

tionship of nitrogen, phosphorus, and carbon to aquatic weed productivity, and investigation of aquatic soil microorganism populations and their possible relation to aquatic weed habitat parameters. A proprietary triethanolamine copper complex was combined with diquat and with the potassium salt of endothall to determine if aquatic herbicidal efficacy could be improved using various combinations. No significant improvement was found using the complexed copper-diquat or complexed copper-endothall mixtures over that activity produced by diquat alone or with a diquat-copper sulfate mixture. No evidence appeared indicating any advantage in using the copper complex, triethanolamine-copper complex-diquat mix over copper sulphate-diquat combinations in high bicarbonate waters. One new emulsifier formulation produced stable emulsions and was recommended for evaluation in operating irrigation canals. Laboratory studies using culture nutrient solution enriched with carbon, nitrogen and phosphorus showed that carbon limited sago pondweed growth while nitrogen and phosphorus did not. Field aquatic habitat studies determined relationships of C, N, and P to pondweed growth. Aquatic soil microorganism relationships to pondweed growth and environment were ascertained. Chemical data on canal soils, physiological types of microorganism populations are reported. (Jones-Wisconsin)

ORGANIC WASTES FOR ACID STRIP-MINE LAKE RECOVERY,
Missouri Univ., Columbia. Dept. of Sanitary Engineering.
C. W. Ogg.
MSc thesis, August 1972. 74 p. 13 fig, 8 tab, 20 ref. OWRR A-038-MO (1).

Descriptors: *Organic wastes, *Acid mine water, *Strip mine lakes, *Reclamation, Sulfur bacteria, Self-purification, *Missouri, Biodegradation, Laboratory tests, Hydrogen ion concentration, Iron, Sulfates, Sulfides, Anaerobic conditions, Carbon, Eutrophication, Hydrogen sulfide, Anaerobic bacteria.
Identifiers: *Sulfate reduction, Sawdust, Sugar maple leaves, Columbia (Mo.), Oak leaves, Newspapers, Wheat straw, Dried cattle manure, Dried digested sewage sludge.

Acid coal strip-mine water with low pH, high acidity, sulfate, and iron concentrations can be recovered by addition of an organic carbon source and allowing sulfate reducing bacteria (obligatory anaerobes) to cause hydrogen sulfide gas export and iron precipitation. If loading rate of organic materials is high enough that a blanket of waste organic matter is present on the bottom and other bacteria utilize the carbon source causing the system to become anaerobic, sulfate reducers become active and recovery of the acid water proceeds according to the relative biodegradability of the carbon source. Any type of biodegradable organic carbon substrate serves as a carbon source. In experiments a wide range of C:N:P ratios was used in the substrates; a table of the ratios is given. Knowledge of the ratios is useful in selecting a waste organic material for control of nutrient input. A limiting factor in field application for recovery is the amount of hydrogen sulfide gas that could be safely released to the atmosphere. The change in pH is not as good as indicator of recovery as is the change in total acidity since there is a strong buffering capacity in acid mine water. (Jones-Wisconsin)

REGIONAL WORKSHOP ON WATER RESOURCES, ENVIRONMENT, AND NATIONAL DEVELOPMENT.

Available from NTIS, Springfield, Va 22151 as PB-217 117 Price $3.00 printed copy; $1.45 cents microfiche. March 13-17, 1972, Singapore: 1972. 116 p.

Descriptors: *Water resources development, *Water pollution control, *Asia, *Environmental control, *Conferences, Documentation, Abstracts, Bibliographies, Reviews, Water quality, Water pollution sources, Oil spills, Eutrophication, Solid wastes, Economics, Social aspects, Ecology, Geographical regions, Foreign countries, Planning.
Identifiers: *Singapore.

This regional workshop under the joint sponsorship of the Science Council of Singapore and the National Academy of Sciences of the USA was concerned with current problems of water resources and the environment faced by countries of the Southeast Asian region, and stimulation of regional cooperation in seeking solutions. The report includes: Section A, Introduction; Section B, Working Group Summaries; and Section C, Recommendations. Included in the appendices are: plenary addresses, abstracts of technical papers, bibliography, and workshop registrants. Besides Singapore, the regional countries represented were Indonesia, Malaysia, Philippines, Thailand and Vietnam. France, Japan, Sweden, the United Kingdom, and the USA also had representatives. W73-13966

TREATED WATER STORAGE FOR DESIGN CAPACITY REDUCTION,
Pennsylvania State Univ., University Park. Dept. of Civil Engineering.
J. Borrelli, and T. M. Rachford.
Journal of the Environmental Engineering Division, American Society of Civil Engineers, Vol 99, No EE4, Proceedings paper No 9941, p 517-533, August 1973. 9 fig, 3 tab, 13 ref, 3 append.

Descriptors: *Water storage, *Environmental engineering, *Costs, *Simulation analysis, Water supply, Storage capacity, Water quantity, Reservoirs, Pipelines, Pumping, Methodology, Groundwater, Aquifers, Costs, Economic efficiency, Operation and maintenance, Design, Decision making.
Identifiers: *Economic analysis, *Design capacity, Sensitivity analysis, Consumption rate, Storage volume.

Treated water storage can be used to lessen peak day consumption rates in order that the design capacity of a water supply system, exclusive of the distribution system, can be reduced while providing equivalent service. A method is described for selecting an approximate least-cost combination of storage volume and design capacity. The treated water storage is to be utilized for the attenuation of high daily consumption rates so that the treatment plant and all upstream components can benefit from a reduction in design capacity and a more efficient level of operation. Treated water storage used for this purpose is called 'intermediate storage' to distinguish it from storage used for all other purposes. There appears to be a potential reduction in the total project cost even with the added costs for storage. The analysis of an example system shows that reductions do occur in the transmission line diameter with the addition of treated water storage, but not in every case. Furthermore, a reduction in the transmission line diameter is not accompanied by a large cost reduction because of other costs such as power increase. (Bell-Cornell)

METHOD AND APPARATUS FOR REMOVING AND RECLAIMING OIL-SLICK FROM WATER,
M. F. Olsen.
U.S. Patent No 3,745,115, 4 p, 7 fig, 9 ref; Official Gazette of the United States Patent Office, Vol 912, No 2, p 661, July 10, 1973.

Descriptors: *Patents, *Oil spills, *Oil pollution, Equipment, *Separation techniques, *Pollution abatement, Water quality control, Water pollution control.

Floats are used to remove oil from a water surface. Each float has a collecting compartment, a ballast compartment and a flexible hose connecting each collecting compartment to a common flexible hose. The hose is connected to a separation tank on a special structure. The separation tank has two ball float control valves, one of which permits the clean water to drain back into the environment while the other permits the collected oil to be drained off for further use or refinement. (Sinha-OEIS)
W73-13971

OIL MOP AND METHOD OF USING SAME,
H. M. Rhodes.
U.S. Patent No 3,744,638, 5 fig, 7 ref; Official Gazette of the United States Patent Office, Vol 912, No 2, p 551, July 10, 1973.

Descriptors: *Patents, *Oil spills, *Oil pollution, Equipment, *Separation techniques, *Pollution abatement, Water quality control, Water pollution control.

The oil mop consists of an endless length of polypropylene line with multiple lengths of long narrow thin gauge strips of the same material extending radially from the line. It absorbs the oil or oil products from the surface of the water. The line passes through the surface of the water and then moves through wringers and/or water or chemical sprays or both to remove the oil from the mop. The oil is deposited in a receptacle and the cleaned mop returns to the water surface to resume its absorption of remaining oil. The endless length of mop is rooved above sheaves or pulleys which are mounted on or near a barge. The wringer rolls when driven perform two functions. They move the mop from the pulley or toward the pulley while squeezing the oil from the mop. (Sinha-OEIS)
W73-13974

WATER-SURFACE CLEANSING SHIP,
W. F. Spanner.
U.S. Patent No 3,744-257, 5 p, 4 fig, 13 ref; Official Gazette of the United States Patent Office, Vol 912, No 2, p 455, July 10, 1973.

Descriptors: *Patents, *Oil spills, *Oil pollution, Equipment, *Pollution abatement, Water quality control, Water pollution control, Ships, *Separation techniques.

A water-surface cleansing ship is provided for removing contaminants such as oil from the surface of water. Its hull is provided with a longitudinal channel through which the surface water will flow. The ship may be self-propelled to cause water to flow by ship movement. To remove contaminants flowing through the channel there are a grill and two conveyor belts. The grill is in the form of a wire coarse mesh screen mounted near the bow opening and extending well below the operating waterline. A seaman positioned on a walkway can remove large contaminants such as oil-soaked sea weed from the grill. One conveyor belt is positioned aft of the grill and is placed so as to project at its forward end into the water flowing in the channel. The belt passes over sprockets and rollers through a tank containing solvent or other washing medium. The second conveyor belt also projects into the water. This belt is in the form of galvanized chains connected by cross supports carrying trays or rods which in turn carry sponges to pick up contaminants. This belt also passes into a tank containing a washing medium. The ship may have a paddlewheel to draw water into the channel. Cleaned water exits from the channel through the ship's stern opening. (Sinha-OEIS)
W73-13977

PROCESS AND APPARATUS FOR CONTAINMENT OF AQUEOUS POLLUTANTS,
R. P. Fennelly.
U.S. Patent No 3,744,254, 3 p, 3 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 912, No 2, p 454, July 10, 1973.

Descriptors: *Patents, *Oil slicks, *Oil pollution, *Pollution abatement, Equipment, Water pollution control, Water quality control, *Separation techniques.
Identifiers: *Bubble barriers.

An improved version of the conventional bubble barrier is described. A gas supplying conduit is located at a point below the surface of the water to form a bubble barrier which rises to the surface of the water and is able to contain the pollutants within a preselected area. A mesh material is placed between at least one point adjacent to the generation point and a point adjacent to the surface of the water to contain the bubbles in a desired line of travel. The mesh material can be ordinary wire screening used in household screens. The upward travel of the bubbles insures that they will strike the mesh material or screening at an angle which is not substantially normal to the plane in which it lies at the point of impact. One end of the mesh screen is attached to a float. Guy wires or restraining members link the floats with the ballast member which is, in turn, attached to the gas conduit. (Sinha-OEIS)
W73-13978

OIL SPILL BOOM,
P. Y. Williams, K. C. Williams, and C. E. Heath.
U.S. Patent 3,744,253, 3 p, 5 fig, 3 ref; Official Gazette of the United States Patent Office, Vol 912, No 2, p 454, July 10, 1973.

Descriptors: *Patents, Oil spills, *Oil pollution, *Pollution abatement, *Separation techniques, Equipment, Water pollution control, Water quality control.
Identifiers: *Oil spill booms.

This boom comprises several alignable interconnectable floats, a continuous screen barrier extending through, between, above and below the floats. The part below is formed of two walls spread apart at the bottom to provide an open bottom water ballast chamber, props and stays to support the screen barrier erected. A number of floats are connected together in line and serve to contain the contaminated area. When the boom is subjected to the forces of wind and/or wave and/or current particularly athwart the structure the open bottom ballast chambers formed by the several walls and the water therein constitutes a restraining force against any tendency of the boom to heel or lift. (Sinha-OEIS)
W73-13979

IMPROVING SURFACE WATER CONDITIONS THROUGH CONTROL AND DISPOSAL OF AQUATIC VEGETATION, PHASE II,
Wisconsin Univ., Madison. Dept. of Agricultural Engineering; and Wisconsin Univ., Madison. Dept. of Mechanical Engineering.
R. G. Koegel, D. F. Livermore, H. D. Bruhn, and P. D. Bautz.
Available from the National Technical Information Service as PB-223 135, $3.50 in paper copy, $1.45 in microfiche. Wisconsin Water Resources Center, Madison Technical Report, 1973. 38 p, 7 fig, 16 photographs, 4 ref. OWRR B-058-WIS (1), 14-31-0001-3665.

Descriptors: *Harvesting, *Aquatic weed control, *Mulching, *Mechanical equipment, *Treatment, *Heating, Feeds, *Wisconsin.
Identifiers: Dane County (Wis), Farm equipment.

The overall objectives of Phase II of the project continue to be the same as those of Phase I, namely, the improvement of equipment and techniques for the mechanical harvesting, processing, and disposal or utilization of aquatic vegetation such that these methods can be an efficient tool in the management of nuisance plants in waterways. Primary emphasis in this Phase of the work has been on high-speed harvesting, application of the Phase I results of the project to field-scale operations by Dane County, Wisconsin, and continued work on processing and utilization of harvested material. An experimental high-speed gathering and skimmer unit was built and tested during 1972. The principle shows considerable promise as part of a two-stage harvesting system. Chopping and surface moisture dewatering on board the harvester have been incorporated into one of Dane County's units. Shuttle barges servicing this unit have been modified to incorporate self-unloading boxes of the type used for forage harvesting. The onboard processing results in decreased weight and volume, and greatly improved handling characteristics of the material and acceptability as a soil additive. Work on processing and utilization has progressed in such areas as (1) heat treatment to modify properties, (2) conversion to silage and, (3) fractionation and determination of constituents. Harvested vegetation for use as a soil conditioner was made available to the public on a trial basis. Included as an appendix is a Bibliography on Dewatering and Dewatering Processes by Vladimin I. Fomin and H. D. Bruhn, containing 293 references. (See also W72-08069)

STIMULATED BIODEGRADATION OF OIL SLICKS USING OLEOPHILIC FERTILIZERS,
Rutgers—The State Univ., New Brunswick, N.J. Dept. of Biochemistry and Microbiology.
R. M. Atlas, and R. Bartha.
Environmental Science and Technology, Vol 7, No 6, p 538-541, June 1973. 3 fig, 1 tab, 13 ref.

Descriptors: *Oil spills, *Biodegradation, *Nitrogen, *Phosphorus, Laboratory tests, Microbial degradation, Model studies, On-site tests, Sea water, Chemical analysis, Degradation (Decomposition), Oil pollution, On-site investigations, Oily water, Gas chromatography.
Identifiers: *Oleophilic fertilizers, *Nutrient sources, Crude oil, Fate of pollutants, CRNF, Octylphosphate, Isooctylphosphate, Hexamethylphosphoramide, Potassium nitrate, Hydrocarbon-oxidizing bacteria, Sodium hydrogen phosphate, Dodecylurea, Mineralization, Trimethylenetetraurea.

Biodegradation of polluting oil at sea is seriously limited by the scarcity of nitrogen and phosphorus. Since water-soluble sources of these elements would be ineffective in the ocean, oleophilic com-

ounds were screened to serve as fertilizers for oil licks. A combination of paraffinized urea and oc-ylphosphate promoted oil biodegradation, both in aboratory experiments and in field trials, to an ex-ent that the practical application of this principle o oil cleanup appears feasible. The tested oleo-hilic fertilizer supplies nutrients to hydrocarbon-egrading microorganisms selectively and, in con-rast to nitrate and phosphate salts, it does not rigger algal blooms. INFLOW, OUTFLOW, AND WATER QUALITY OF MISSION LAKE, NORTH-CENTRAL MONTANA,
Geological Survey, Helena, Mont.
L. R. Frost, Jr.
Open-file report, 1973. 27 p, 8 fig, 2 tab, 5 ref.

Descriptors: *Irrigation water, *Water quality, *Lakes, *Montana, Water analysis, Chemical analysis, Salinity, Inflow, Discharge (Water), Water supply development, Water management (Applied), Routing, Diversion, Irrigation.
Identifiers: *Mission Lake (Mont), *Lake flush-ing, Salinity dilution.

Chemical analyses made in 1955 of samples from Mission Lake in Montana indicated the water was unsuitable for irrigation of most crops. Since that time, the lake has been flushed periodically with good quality water from Two Medicine Canal. Through this flushing process the concentration of dissolved solids in the lake water has been reduced approximately 87%. The water in Mission Lake meets criteria established by the U.S. Salinity Laboratory Staff for irrigation water applied to well-drained land. The lake water is approaching the chemical quality of the inflow; however, in-creased amounts of flushing are required to effect additional significant changes in the quality of the lake water. Continued careful flushing with most of the available flow in Two Medicine Canal could, within 2 to 3 years, make the water meet criteria established for water applied to all but the most salt-sensitive crops. UNCERTAINTIES IN WATER QUALITY MODELING: THE CASE OF ATMOSPHERIC REAERATION,
Rutgers--The State Univ., New Brunswick, N.J. Dept. of Civil and Environmental Engineering.
S. L. Yu.
In: Proceedings (Vol III), International Symposium on Uncertainties in Hydrologic and Water Resource Systems, University of Arizona, Tucson, Dec 11-14, 1972, p 962-976, (1972). 6 fig, 26 ref.

Descriptors: Atmosphere, *Reaeration, *Water quality, Management, Costs, *Dissolved oxygen, *Mathematical models, Estimating, Water pollution control, Decision making, Streams, Stochastic processes, Systems analysis, *Risks, *New Jersey.
Identifiers: *Passaic River basin (N.J.), Errors, Tracer method, Disturbed-equilibrium method, DO balance method.

Atmospheric reaeration is the primary means by which a water body replenishes its oxygen content. The transfer of oxygen across the air-water interface is characterized by the reaeration coefficient, designated by Ka. Knowledge of the reaeration coefficient permits determination of the self-purification capacity of a stream and thus the allowable amount of waste discharged into the stream. In designing a water quality management program, a low estimate of Ka would result in requiring a higher degree of waste treatment than necessary, while an overestimate would result in undesirable pollution of the stream. A slight error in the reaeration coefficient estimate could result in tremendous differences in the economy of a water quality management program. Herein, various sources of uncertainty in determining the reaeration coefficient are examined, and the expected errors discussed. Also the effect of errors in estimating Ka on the cost of water quality management is demonstrated by carrying out a case study on New Jersey's heavily polluted Upper Passaic River. The three basic methods for measuring Ka in the field--dissolved oxygen balance method, disturbed equilibrium method, and tracer method--are discussed. (See also W73-14166) (Bell-Cornell)

06. WATER RESOURCES PLANNING

FINANCING COSTS OF WATER POLLUTION CONTROL IN SWEDEN,
National Swedish Environment Protection Board, Stockholm. Water Quality Dept.
B. Hawerman, and B. Helmersson.
In: Water Management--Basic Issues; Organization for Economic Cooperation and Development, Paris, France, p 445-448, 1972. 1 fig.

Descriptors: *Water management (Applied), *Water costs, *Cost sharing, *Water pollution control, *Cost allocation, Economics, Comprehensive planning, Administration, Grants, Taxes, Pollution taxes (Charges).
Identifiers: *Sweden.

The main problem in water management in Sweden is water pollution control. Sewage and waste water discharge and the establishment of new industries often interfere with the use of the coastal water for recreation purposes. This conflict between industrial and recreational interests presents one of the liveliest debated environmental issues today. Industries having significant waste discharge problems allocate on the average about 5% of their total annual capital investment for pollution control facilities and equipment. Municipalities have for the past several years devoted about 20% of total annual capital expenditure for water supply and sewerage systems construction. Annual capital expenditures for the past several years have been about 60 Swedish kroner per person. To facilitate the financing of water treatment projects, the State government pays from 30% to 50% of the construction costs of municipal sewage treatment plants and 35% of the costs for prevention of water pollution at industries established before July 1, 1969. Identifiers: *Nonlinear programming, *Multiple objectives, Streeter-Phelps model, Interactive algorithms.

Most decision problems involve multiple objectives, yet conventional mathematical programming methods ignore the human elements peculiar to each decision problem. This paper seeks to incorporate these subjective issues into an interactive algorithm, and describes a case study by applying Semops, a sequential multiobjective problem solving technique which allows the decision maker to trade off one objective versus another in an interactive manner. Semops cyclically uses a surrogate objective function based on goals and the decision maker's aspirations about achieving these goals. The algorithm, applied to a synthetic case study of regional water quality management, demonstrates that (1) a complex situation can be handled, (2) the individuality of the decision maker's preference structure is preserved, (3) the feasible alternatives do not need to be specified a priori, and (4) the concept of a satisfactory solution rather than an optimum solution is more realistic in situations involving conflicting goals. (Bell-Cornell)

Identifiers: *Multiobjective screening models, Environmental quality, Water resource investment, Income benefits.

An application of multiobjective theory to the analysis of development alternatives for a large-scale river basin is presented. A river and its uses represent a complex stochastic physical system embedded in an economic, social, and institutional framework difficult to model. That which endeavors to model analytically the interrelated decision in the context of this physical and nonphysical environment is a screening model. Such a model is an optimization problem which maximizes net discounted benefits subject to continuity constraints on water flow, technological constraints on the alternatives, and policy constraints. Presented is a case study of a river system in which development is to be planned according to national and regional objectives. A linear programming screening model for finding the best set of development alternatives from a national objective point of view is introduced and a brief discussion of methods for handling more than one objective in such models is presented. An analysis of the trade-offs between the two objectives is demonstrated by using a constraint method. The transformation curve between net national income benefits from power and irrigation and regional equity as measured by deviation from an equal regional water distribution is shown. (Bell-Cornell)

SUGGESTED BASIC GUIDELINES FOR A LONG-TERM PLAN OF ACTION IN THE FIELD OF HYDROLOGY, (QUELQUES REFLEXIONS DE PRINCIPE POUVANT SERVIR DE GUIDE A UN PLAND'ACTION A LONG TERME),
N. I. Chenet.
In: Status and Trends of Research in Hydrology, 1965-74; Proc. of International Conference held at UNESCO Headquarters, December 8-16, 1969, Paris: United Nations Educational, Scientific and Cultural Organization, Paris, p 141-148, 1972.

Descriptors: *Water balance, *Data collections, *International Hydrological Decade, Precipitation (Atmospheric), Hydrology, Surface waters, Groundwater, Sedimentation, Networks, Hydrologic cycle.
Identifiers: *World water balance.

Hydrology's sphere of activities and its key role in water problems are reviewed. The principles on which international cooperation in this field should be founded and, objectives in five basic areas (development of measurement networks; establishment of balances; the study of data for preparing civil-engineering projects; hydrological forecasts; and long-term developments taking into account the influence of man) are discussed. Cooperation between nations, international organizations, governmental organizations and non-governmental organizations is reviewed. The general line of policy should be to define jointly, as clearly and in as great detail as possible, each of the problems to be solved, together with the various components in the corresponding program; to leave to whichever international body so desires the responsibility of proposing and carrying out each of the components of the program, each country being responsible for dealing with its own problems on a national, regional, and international level. It would be desirable to obtain in this way a clear picture of the responsibilities of each organization and to organize more extensive cooperation, involving several institutions, on subjects calling for a synoptic approach. Consideration should be given to the necessity for setting up machinery to enable the governments and international organizations concerned to meet and reach agreement on action. If UNESCO is well placed to host such a body, then it would be important to make a clear distinction between UNESCO's own program and its role as host to this body. Each international organization concerned should agree to accept full responsibility for the part of the program which concerns it, and to report to the deliberative body with a view to agreement on concerted action. INTERNATIONAL SYMPOSIUM ON UNCERTAINTIES IN HYDROLOGIC AND WATER RESOURCE SYSTEMS, VOL III.

Available from University of Arizona, Tucson, Dept of Hydrology and Water Resources $22.00/set. Proceedings (Vol III), International Symposium on Uncertainties in Hydrologic and Water Resource Systems, University of Arizona, Tucson, December 11-14, 1972, p 934-1661, (1972).

Descriptors: Water resources development, *Planning, *Management, *Decision making, Economics, *Systems engineering, *Data collections, *Stochastic processes, Hydrology, Model studies, Systems analysis, Hydraulics, Water quality, Water quantity, Probability, Optimization, Simulation analysis, Analytical techniques, Projects, Design, Estimating, *Risks.
Identifiers: Subjectivity, Model construction, Socio-economic losses, Errors

This Symposium focuses upon the role of the decision sciences in evaluating uncertainties inherent in water resource planning, design, investment, and operations. In Volume III, there is considerable concern with the role of subjectivity in the use of data and construction of models and with the need for more formal consideration of socioeconomic losses associated with underestimation and overestimation errors. Volume III's first section contains the last 14 papers given. The second section provides a series of general reports, each one serving to review the papers presented in one particular category, at the Symposium. Included are the report of Kisiel and Duckstein on the papers comprising the Symposium subject 'Model Choice and Validation,' and that of P.E. O'Connell covering the papers in the category 'Stochastic and Statistical Models.' Each general report is followed by short discussions, and replies by the author (s) of the paper in question. The volume closes with a list of Symposium participants and the Symposium's schedule. (See W73-12269, W73-13134, and W73-14167 thru W73-14180) (Bell-Cornell)

UNCERTAINTIES IN HYDRAULIC MODELS,
Arizona Univ., Tucson. Dept. of Hydrology and Water Resources.
S. Ince.
In: Proceedings (Vol III), International Symposium on Uncertainties in Hydrologic and Water Resource Systems, University of Arizona, Tucson, December 11-14, 1972, p 934-939, (1972).

Descriptors: *Hydraulic models, Engineering, *Design, Model studies, Fluid mechanics, Calibrations, Mathematical models, *Risks.
Identifiers: Prediction.

The role of hydraulic models in engineering design is reviewed. Hydraulic models were frequently employed in design problems defying analytical solutions. Now digital computers allow many fluid mechanics phenomena to be modelled by numerical methods. But many instances remain where hydraulic models are practical and sometimes the only method for prediction of events after the construction of engineering structures, such as certain mobile bed fluvial hydraulic problems, and models of coastal processes. A hydraulic model is particularly valuable when operated conjunctively with a mathematical model. Successful use of these models depends greatly upon the exposure, interpretation and resolution of uncertainties at each step of the study. These steps are, as in all modelling techniques: (1) model calibration; (2) model validation; and (3) model experimentation. For model calibration there are uncertainties: (a) about modelling parameters; (b) in the prototype data; and (c) in instrumentation. The validation of the model is subject to the same uncertainties but usually suffers also from the fact that all data has been used in one form or another for the calibration and there is not sufficient time to collect additional data. (See also W73-14166) (Bell-Cornell)
W73-14167

AN APPROACH TO FORMULATING STRATEGIES FOR FLOOD FREQUENCY ANALYSIS,
Geological Survey, Washington, D.C.
N. C. Matalas, and J. R. Wallis.
In: Proceedings (Vol III), International Symposium on Uncertainties in Hydrologic and Water Resource Systems, University of Arizona, Tucson, December 11-14, 1972, p 940-961, (1972). 1 fig, 3 tab, 3 ref.

Descriptors: *Flood frequency, *Analysis, *Monte Carlo method, *Reservoirs, *Design flood, Analytical techniques, Equations, Planning, Management, Probability, Risks.
Identifiers: *Cost minimization, Overdesign, Underdesign.

Monte Carlo experiments are used to determine the strategies--choice of frequency distribution--for minimizing the overdesign, underdesign, and total costs associated with the T ± 50 year reservoir design flood. Given that the real world flood frequency distribution is either a three parameter Pearson Type III or a three parameter log-normal distribution, the choice of distribution is taken to be either a Pearson Type III, a log-normal, or a Gaussian distribution. In general, pure strategies do not exist--the strategies being somewhat dependent upon n, the flood sequence length, and gamma (x), the real world coefficient of skewness for flood events. For n and gamma (x) small, the Gaussian distribution services to minimize the overdesign costs. If the Gaussian distribution is disregarded, the overdesign and total costs are minimized by choosing a log-normal distribution no matter what the real world distribution is. The choice of distribution for minimizing underdesign costs depends upon n, gamma (x), and the real world distribution. These strategies are conditional on the assumed piece-wise linear cost function. (See also W73-14166) (Bell-Cornell)

ENTROPY IN THE ASSESSMENT OF UNCERTAINTY IN HYDROLOGIC SYSTEMS BEHAVIOR AND IN MATHEMATICAL MODEL PERFORMANCE,
California Univ., Davis.
J. Amorocho, and B. Espildora.
In: Proceedings (Vol III), International Symposium on Uncertainties in Hydrologic and Water Resource Systems, University of Arizona, Tucson, Dec 11-14, 1972, p 977-1008, (1972). 6 fig, 1 tab, 3 ref.

Descriptors: *Entropy, *Hydrologic systems, *Mathematical models, *Streamflow, *Runoff, Variability, Basins, California, Simulation analysis, Systems analysis, Equations, Decision making, Evaluation, *Risks.
Identifiers: Historical flow data.

Some uses and limitations of the concept of entropy in assessing the performance requirements of hydrologic models for particular catchments are explored. In representing natural catchment systems with mathematical models, a relatively wide range of choice exists among models of various degrees of completeness and sophistication. Considering cost, as well as appropriateness of a model for a particular purpose, it is desirable to have an objective criterion to make this selection. Entropy, as used in information theory, provides one such criterion. Entropy is a measure of the degree of uncertainty of a particular outcome in a process; therefore, in dealing with the prediction of a hydrologic variable, such as streamflow, one can compute the entropy of this variable from historical data, thus characterizing the unexpectedness or variability inherent in the process. This represents a property of the system and is called marginal entropy. It is likewise possible to evaluate the uncertainty of the predictions made by a given mathematical model of the catchment by comparing these predictions with the measured flow. This is done through conditional entropy. By combining these two entropy functions, 'transinformation' is obtained, providing an objective evaluation of the goodness of the model. These criteria were applied to a basin for which a number of years of historical flow record and concurrent model simulations were available. (See also W73-14166) (Bell-Cornell)

A METHODOLOGY FOR TESTING SYSTEM THEORETIC MODELS,
Forest Service (USDA), Flagstaff, Ariz. Rocky Mountain Forest and Range Experiment Station.
J. J. Rogers.
In: Proceedings (Vol III), International Symposium on Uncertainties in Hydrologic and Water Resource Systems, University of Arizona, Tucson, Dec. 11-14, 1972. p 1029-1038, (1972). 5 ref, 1 append.

Descriptors: *Systems engineering, *Methodology, *Testing, *Mathematical models, *Theoretical analysis, Decision making, Systems analysis, Water resources.

The objectives of testing system models are to determine whether or not they are acceptable with respect to the real world and to determine the validity and extendability of the models throughout, and perhaps outside of, their intended area of application. The problem is essentially of a decision-theoretic nature and hence probabilistic considerations become important. The entire procedure of model development, testing, validation and choice can be treated within the formal framework of the mathematical theory of systems engineering proposed by A. Wayne Wymore. Wymore's theory provides a rigorous, comprehensive, powerful methodology capable of testing and validating a model throughout its intended area of application, and capable of handling extremely large and complex modeling programs. These abilities will undoubtedly be a necessity in the development of ecosystem models and ecological management systems. (See also W73-14166) (Bell-Cornell)

DESIGNING RESERVOIR CONTROL POLICIES WITH CHANCE CONSTRAINED PROGRAMMING,
London Graduate School of Business Studies (England).
M. Lane.
In: Proceedings (Vol. III), International Symposium on Uncertainties in Hydrologic and Water Resource Systems, University of Arizona, Tucson, Dec. 11-14, 1972. p 1081-1104, (1972). 1 fig, 4 tab, 23 ref, 1 append.

Descriptors: *Model studies, *Reservoir design, *Irrigation water, *Optimization, *Size, Hydrology, Agriculture, Crops, Rainfall, Management, Reservoir releases, Reservoir storage, Water demand, Constraints, Decision making, Systems analysis.
Identifiers: *Chance-constrained programming, *Linear decision rule, Operating policies, Control policies.

Some of the issues involved in using chance constraints for designing water resource systems and their optimal operating policies are explored, via a numerical example. A conditional chance constrained model for the Irrigation Problem is presented together with its numerical solution; it is analyzed and then contrasted with two alternative models of the same system when slightly different assumptions are made about system operation. The first alternative model assumes a different informational structure in the linear decision rule that is used to characterize reservoir operating policy. This comparison produces some conclusions about the nature of optimal decision rules and their information base. The second model comparison reveals that the pre-specified levels of probability with which the constraints are required to hold, may not be optimal for the specified class of decision rules. Significantly, it is shown that the amendments that need to be made to the required probability levels may be gained using dual information and parameterizing. Dual information from chance constrained models has hitherto been unexploited, but it clearly represents an important contribution from these models. This is further demonstrated by the derivation, from the dual, of a differential water pricing scheme that may be used to decentralize the agricultural decision. (See also W73-14166) (Bell-Cornell)
W73-14175

A GROUND-WATER PLANNING MODEL - A BASIS FOR A DATA COLLECTION NETWORK,
Geological Survey, Washington, D.C.
T. Maddock, III.
In: Proceedings (Vol. III), International Symposium on Uncertainties in Hydrologic and Water Resource Systems, University of Arizona, Tucson, December 11-14, 1972. p 1105-1130, (1972). 1 fig, 10 tab, 5 ref.

Descriptors: *Groundwater, *Management, *Planning, *Operation and maintenance, Economics, Pumping costs, Arid lands, Hydrologic aspects, *Optimization, Data collections, Systems analysis, Mathematical models.
Identifiers: *Mixed integer programming, *Separable programming, Cost minimization, Sensitivity analysis, Error analysis.

Efficient groundwater management endeavors to: (1) determine the least cost operation of existing wells; (2) determine the least cost spatial and temporal development of new wells; and (3) determine a least cost transport system to move the pumped water to a central location. Mixed integer programming provides a planning and management model that yields the desired information. The model is tested using an example, hypothetical groundwater system typical of those encountered in arid regions. A sensitivity and error analysis is applied to the model to determine the response of the management and planning activities to economic factors such as well drilling, pumping and pipeline costs, and to hydrologic factors such as the transmissivity and storage coefficients. The response is measured in terms of costs associated with the model's parameter estimation errors, as measured by losses of profit. The sensitivity analysis determines a ranking of factors in terms of their error effects and in terms of priority for further data collection activities. (See also W73-14166) (Bell-Cornell)
W73-14176

SUBJECTIVE INPUTS AND UNCERTAINTY IN DECISION PROBLEMS,
Arizona Univ., Tucson. Dept. of Systems and Industrial Engineering.
W. R. Ferrell.
In: Proceedings (Vol. III), International Symposium on Uncertainties in Hydrologic and Water Resource Systems, University of Arizona, Tucson, December 11-14, 1972. p 1131-1145, (1972). 43 ref.

Descriptors: *Decision making, *Probability, Measurement, Value, Estimating, Data collec-

tions, Analytical techniques, Mathematical models, Operations research, *Risks.
Identifiers: *Subjective inputs, Errors, Judgment, Human performance.

Much current thinking about decision making is dominated by the modern conception decision theory problem. Although that conception would appear to offer the ultimate in objectivity, it is founded, in each particular case, upon subjective judgements, and the quantities that characterize it depend upon subjective estimation. Subjective inputs to decision making are a necessity, not just a compromise that msut be tolerated. Creative, valuational, and judgmental inputs are required both to formulate a decision theory problem and to make the measurements needed to solve it. One type of judgmental input, the estimation or expression of probabilistic information is considered in some detail. Evidence indicates that people can accurately express directly-experienced and well-understood characteristics of probabilistic phenomena, but that some fairly simple statistical properties are counter-intuitive. Care must be taken in checking and calibrating probability and parameter estimates, and one must be alert to possible bias due to the response mode. Work on man-machine cooperation in probability revision indicates the importance of avoiding unnecessary operations at which man's subjective performance is relatively poor, such as computation or aggregation of the impact of evidence. However, man's ability to compare, quantitative through likelihood ratios, implicit models of possible states of the world is remarkable and can be usefully exploited. INTUITION, POLICY AND MATHEMATICAL SIMULATION,
British Columbia Univ., Vancouver. Resource Science Center.
J. Kane.
In: Proceedings (Vol. III), International Symposium on Uncertainties in Hydrologic and Water Resource Systems, University of Arizona, Tucson, December 11-14, 1972. p 1146-1166, (1972). 1 fig, 3 ref.

Descriptors: *Simulation analysis, *Computer programs, *Canada, Evaluation, Psychological aspects, Mathematical models.
Identifiers: *Subjective inputs, *Environmental policy, Philosophical attitudes, Data, Group activity.

The role of intuitive or subjective inputs to environmental simulation models is discussed. The main problem in structuring such inputs for the computer has been one of inappropriate format -- intuition and opinion have been treated as confused arithemtic messages when in fact they are trying to communicate geometric information. With this insight, it becomes relatively simple to develop computer languages which can readily combine subjective evaluation with quantitative data. A mathematical language, KSIM, has been developed which articulates what people sense to be the relationships between a number of interacting variables. The use of KSIM is discussed and the results of its application in matters affecting Canadian environmental policy are described. In particular, the psychological and philosopical attitudes that were found necessary to foster before such group activity results in effective modeling efforts are described. FIRST-ORDER ANALYSIS OF MODEL AND PARAMETER UNCERTAINTY,
Massachusetts Inst. of Tech., Cambridge. Dept. of Civil Engineering.
C. A. Cornell.
In: Proceedings (Vol. III), International Symposium on Uncertainties in Hydrologic and Water Resource Systems, University of Arizona, Tucson, December 11-14, 1972. p 1245-1274, (1972). 2 fig, 20 ref.

Descriptors: *Model studies, *Probability, *Stochastic processes, Engineering, Hydrology, Analytical techniques, Operations research, Rainfall, Streamflow, Basins, Storms, Runoff, Equations.
Identifiers: *First-order analysis, Model uncertainty, Parameter uncertainty, Conditional analysis.

Tools and illustrations of first-order uncertainty analysis are reviewed, using hydrologic examples. Use of this analysis procedure makes practical more realistic modeling of engineering problems since it works with only first- and second-order moments of random variables and processes, and, if necessary, reduces non-linear functional or system relationships to linear ones in terms of the random (deviation from the mean) component of any dependent variables. The modeling can include uncertainty in the physical models used and in the parameters of those models. In particular, the moments of the random variables may be uncertain. These basically subjective uncertainties may propagate differently in the model than the uncertainty in the random variables. First-order Bayesian statistical operations are introduced to permit the combination of encoded prior information and observed data. (See also W73-14166) (Bell-Cornell)

6B. Evaluation Process

THE IMPACT OF RESERVOIR RECREATION ON THE WHITNEY POINT MICROREGION OF NEW YORK STATE,
Cornell Univ., Ithaca, N.Y. Water Resources and Marine Sciences Center.
R. C. Hinman.
Available from the National Technical Information Service as PB-222 994, $6.00 in paper copy, $1.45 in microfiche. Technical Report No 18, August 1969. 73 p, 1 fig, 1 chart, 23 tab, 41 ref, 1 append. OWRR B-002-NY (5). 14-01-0001-823.

Descriptors: *Reservoirs, *Recreation, *Economic impact, *Regional analysis, *New York, *Input-output analysis, Surveys, Estimating, Recreation demand, Resource allocation, Economies, Regions, Lakes, Summer, Systems analysis, Mathematical models.
Identifiers: *Whitney Point (NY), Water-based recreation, Microregions.

Increased income, more leisure time, and improved transportation systems enable Americans to allocate more time to recreational activities. Of particular importance to this study is the continued increase in demand for outdoor recreation. Governmental legislation and grants and other public, as well as private, sources have been supporting resource allocation to insure the availability of outdoor recreational benefits to the American people. The economic impact of introducing reservoir recreation on the economy of the Whitney Point Microregion in Central New York State is analyzed. The setting, background and development of the Whitney Point Reservoir recreation area are discussed. The two methods used to evaluate the economic impact are: (1) A user survey, conducted to determine such factors as the magnitude and type of expenditures incurred by reservoir users in the micro-region, the origin and number of users, and other pertinent factors; and (2) Input-out analysis, which relies on a business-government-household survey. These methods are presented and their empirical results are evaluated. The introduction of reservoir recreation at Whitney Point has been a mild, seasonal stimulant to economic growth. Introduction of a summer lake and accompanying recreational facilities has been an asset to the rural residential environment, it is likely to attract new residents in the future. (Bell-Cornell)

FORECASTS FOR THE FUTURE-POPULATION,
Geological Survey, Carson City, Nev. Water Resources Div.
V. R. Hill.
Nevada Water Planning Robert 5, February 1973. 76 p, 23 fig, 4 map, 24 tab, 30 ref, 3 append

Descriptors: *Population, *Nevada, Water resources development, *Planning, Human populations, Urbanization, Water use, Water requirements, Forecasting.
Identifiers: *Population forecasting.

Graphic techniques recently developed are applied to decennial census data for Nevada to predict how many people and their location by county, hydrographic region and size of place, in the 1970 to 2020 period. Municipal-industrial water use projections are made for Nevada counties and hydrographic regions in the 1970 to 2020 period. The national population is predicted for the same period. Net migration into Nevada is large compared to natural increase. This average relative importance is 2 1/2 to one. Nevada natural increase rate for the 1960 decade was calculated from its components of birth rate and death rate, and comparisons were made with U.S. data, as published in the 1970 Statistical Abstract of the United States. Nevada's birth rate during this period has averaged 11% higher and the death rate 14% lower than the U.S. Recent data indicate that the associated natural increase ratio is widening. Nevada's projected high population curve yields 1.8 million people in 2020. If the trend established by Nevada in the 1950-1970 period were to be extended to 2020, there would be about 7.2 million people in Nevada. (Knapp-USGS)

A SYNOPSIS OF THE NATIONAL WATER COMMISSION'S FINAL REPORT.
Water Resources Council, Washington, D.C.

June 1973. 92 p.

Descriptors: *National Water Commission, *Legislation, *Water resources development, Water law, Federal government, Water management (Applied), Planning.

A Synopsis of the final report of the National Water Commission 'Water Policies for the Future' (See W73-12052) contains the introductory paragraphs from each chapter and section and all the Commission's conclusions and recommendations of the policies which it believes the Nation should adopt for the efficient, equitable, and environmentally responsible management of its water resources. The Commission has examined virtually the entire range of water resources problems facing the Nation, including the effects of water management on the Nation's economy and on its environment. The problems of reconciling Federal and State water law have been addressed, as have the problems of integrating groundwater and surface water management. The important purposes for which water is used have been studied, and appropriate policies have been drawn. Ways in which existing water supplies can be used more efficiently and present supplies can be augmented have also been examined. Standards by which interbasin transfers of water have been developed and ways in which water management can be im-

proved have been formulated. The financing of future water programs as well as the important question of costs are also addressed. Specific recommendations are included for action at the Federal, State, and local levels. (Knapp-USGS)

PUBLIC INVESTMENT IMPACTS AND REGIONAL ECONOMIC GROWTH,
Utah State Univ., Logan. Dept. of Economics.
W. C. Lewis.
Water Resources Research, Vol 9, No 4, p 851-860, August 1973. 3 fig, 2 tab, 14 ref, append.

Descriptors: Water resources development, *Investment, *Regional development, *Regional economics, *Industries, Costs, Model studies, Decision making.
Identifiers: Economic growth, Predicting, Public investment.

Ideas and concepts are articulated which extend the theory underlying the role of public investment, including investment in water resources development, in the process of regional economic growth. Hypotheses concerning interdependencies among public investment impacts are investigated in the context of an industrial location model of regional growth. The model is used to demonstrate the possibility that, because of external economies associated with the development of private activities in a region and the existence of minimum-sized thresholds for the appearance of other activities, there are interdependencies among seemingly independent investment impacts. The analysis suggests that construction impacts as well as developmental impacts should be considered in the investment decision-making process. Implications for the growth center strategy for regional development are also discussed. The analysis offered is essentially conceptual and interpretive, tendering only limited empirical evidence in support of the ideas. (Bell-Cornell)

A RIVER BASIN MANAGEMENT POST-AUDIT AND ANALYSIS,
Little (Arthur D.), Inc., Cambridge, Mass.
J. M. Wilkinson.
Available from the National Technical Information Service as PB-222 941, $6.50 in paper copy, $1.45 in microfiche. Final Report, August 1973. 275 p, 3 fig, 25 tab, 238 ref. OWRR C-3353 (3719) (1).

Descriptors: *River-basins, *Planning, *Institutions, *Water law, *Water policy, Administration, State governments, Coordination, Missouri River, *Regional analysis, Management, *Interstate compacts, Interstate rivers.
Identifiers: *Missouri River Basin.

The water management history of the Pick-Sloan Missouri River Basin Program was analyzed with particular emphasis on federal, State, local and non-government institutional arrangements and an evaluation of performance of these institutions over a 28-year period, 1944-1972. The statutory bases for these institutions was documented. Performance criteria included effectiveness in regional policy, planning, programming and operational management and their responsiveness to social change. The regional economy was compared in 1940 and 1970, in the light of expectations of the original plan and actual realization of intended results, with emphasis on the role of water. The analysis prompted recommendations for new institutional re-orientations for the future that would better serve the needs of multi-State regionalism.

SURVEY OF ESTUARINE SITE DEVELOPMENT LAGOON HOMEOWNERS, OCEAN COUNTY, NEW JERSEY,
Rutgers - The State Univ., New Brunswick, N.J. Dept. of Environmental Resources.
G. H. Nieswand, C. W. Stillman, and A. J. Esser.
Available from the National Technical Information Service as PB-223 012, $3.50 in paper copy, $1.45 in microfiche. New Jersey Water Resources Research Institute, New Brunswick, July 1973. 59 p, 4 fig, 1 tab, append. OWRR B-040-N.J. (2).

Descriptors: *Lagoons, *Sites, *Recreation demand, Estuaries, Resource development, Wetlands, *Attitudes, *New Jersey.
Identifiers: *Public attitudes, Housing.

A large number of estuarine site development lagoon systems have been constructed along the New Jersey shore with little, if any, knowledge regarding the true nature of the system being created and its impact on the exiting natural estuarine systems. As part of a comprehensive study and evaluation of these lagoon systems, a questionnaire survey of estuarine site development lagoon homeowners in Ocean County, New Jersey was conducted in the spring of 1972. The purpose of this survey was to characterize lagoon development in terms of the individuals who purchase and live in lagoon homes, the use of these homes and the utilization of the resources of the area by residents. The results indicate that residents are generally quite satisfied with their lagoon homes. In spite of perceived major problems of pollution and over-development, very few homeowners indicate an intent to sell their homes. A large number of seasonal residents intend to convert their homes to year-round residences. Although a substantial number of lagoon homes are used as seasonal residences, the majority are used as year-round residences, with a large number of the permanent residents being retired. As would be expected, the most popular recreational activities among lagoon residents include swimming, motor boating, fishing, rest and relaxation, and crabbing and shellfishing, with most recreational time being spent on a resident's own property or on lagoon or bay waters.

OUTDOOR AMERICA--A PLAN FOR PROVIDING RECREATION OPPORTUNITIES TO THE NATION.
Bureau of Outdoor Recreation, Washington, D.C.

Available from NTIS, Springfield, Va 22151 as PB-215 187, Price $6.00 printed copy; $1.45 microfiche. First Draft report, February 16, 1973. 321 p.

Descriptors: *Recreation, *Recreation facilities, *Recreation demand, United States, Planning, Reviews, Evaluation, Social needs, Economics, Water utilization.
Identifiers: *Outdoor recreation plan (USA).

This Nationwide Outdoor Recreation Plan is the result of a long-building recognition of the need for recreation planning on a national scale. The use of leisure time and participation in outdoor recreation activities has gradually been coming into focus as a part of everyday living which should receive more than just passing attention from government, educational institutions and business. Despite the continuing growth in outdoor recreation, there are many Americans who have not yet been able to 'join in the action' or even watch it. These are the people who don't have recreation opportunities readily available to them. Because of economics, age, physical or mental handicaps, or just living where opportunities don't exist, they go without. This plan, therefore, addresses itself not only to the ramifications of the recreation boom, but also to what for many is a recreation bust. (Woodard-USGS)

PRICE ELASTICITY OF DEMAND FOR MUNICIPAL WATER: A CASE STUDY OF TUCSON, ARIZONA,
Colorado State Univ., Fort Collins. Dept. of Economics.
R. A. Young.
Water Resources Research, Vol 9, No 4, p 1068-1072, August 1973. 1 fig, 2 tab, 5 ref.

Descriptors: *Water supply, *Municipal water, *Pricing, *Elasticity of demand, *Consumptive use, *Statistical methods, Regression analysis, Time series analysis, Least squares method, Rainfall, *Arizona.
Identifiers: *Tucson (Ariz)

The characteristics of the demand for municipal water supplies can be used by water authorities to predict the response of consumers to changes in water pricing policies and to provide a basis for long-term consumption forecasts. Consumer response to price is conveniently measured by the concept of 'price elasticity of demand,' defined as the percentage in quantity consumed associated with a 1% change in price. Procedures and results are reported of a statistical analysis of the forces influencing water consumption in Tucson, Arizona, using time series data. Estimates of the price elasticity of demand for municipal water were derived by statistical regression. Regression coefficients relating consumption to price and rainfall were estimated using conventional least squares procedures. A significant shift in demand was found to have occurred subsequent to 1964. The price elasticity was estimated at about -0.63 during 1946-1964 and -0.41 during 1965-1971. These results are consistent with those obtained in other urban water demand studies of the arid parts of the western United States. The data subjected to statistical analysis were for one community, in contrast to the more typical approach using cross-sectional observations of a number of communities during a specific time period. (Bell-Cornell)

FORECASTING WATER USE FOR ELECTRIC POWER GENERATION,
City Univ. of New York. Dept. of Mathematics.
H. P. Young, and R. G. Thompson.
Water Resources Research, Vol 9, No 4, p 800-807, August 1973. 4 fig, 5 tab, 13 ref.

Descriptors: *Water supply, *Water demand, *Electric power industry, *Water withdrawal, *Water consumption (Except consumptive use), *Forecasting, Freshwater, Pricing, Analysis, Effluents, Standards, Taxes, Cooling, Methodology, Alternative planning.
Identifiers: *Heat discharge, Demand analysis.

Knowledge of demand functions for water and electricity provides a basis for forecasting water withdrawals, water consumption, and heat discharges to the water in electric power generation. The variables in these demand functions may be significantly affected by direct and indirect variations in policy. A major difficulty in recent studies devoted to forecasting future levels of water use to determine the adequacy of water supplies is that the demands for water are forecast as 'requirements.' Unfortunately, use of the term requirements carries the implication that water demands cannot be substantially altered, and there is little use in knowing that water demands are going to outstrip supplies unless a framework is provided for analyzing how demands (or supplies) can be changed. Various factors affecting demand for water withdrawals and consumptive use for a particular economic sector electric power generation are discussed. Forecasts of water withdrawals and consumption of water are made for alternative combinations of the variables in the demand functions and compared with the results of previous studies in which water demands were forecast as 'requirements.' This type of analysis if carried out systematically for all the major water-using industries should provide information better than that presently available for planning future policy. (Bell-Cornell)

FORECASTING WATER USE FOR POLICY MAKING: A REVIEW,
Houston Univ., Tex. Dept. of Quantitative Management Science.
R. G. Thompson, and H. P. Young.
Water Resources Research, Vol 9, No 4, p 792-799, August 1973. 3 fig, 12 ref.

Descriptors: *Water demand, *Water use, *Forecasting, *Estimating, Water policy, Projects, Electric power industry, Withdrawal, Equations, Investment, Prices, Cost analysis, Linear programming, Mathematical models, Systems analysis.
Identifiers: Cost minimization, Demand analysis.

This study reviews the basis for estimating withdrawal, consumptive, and disposal demand functions for water in production. The derived demand function for water is the basis for forecasting water use in production. Substituting inputs in production is the key idea underlying derived demand functions for water. The form of the derivation is illustrated for certain types of substitutions in a steam electric generating plant. A linear method of approximating derived demand functions is discussed, references to previous studies in agriculture and petroleum refining are made. Several demand functions estimated in this way are then used to evaluate proposed investments in water resource regulation. The most important application of the withdrawal, consumptive, and disposal demand functions is that they allow alternative projections of water use by systematically varying the factors that influence the demand for water. The second application is that the demand function provides a basis for evaluating whether or not specific investments in flow regulation or interbasin transfers are justified by the demand for the water that these projects would provide. (Bell-Cornell)

Descriptors: *Mathematical models, *Water demand, United States, *Land use, *Agriculture, *Resource allocation, *Water supply, *Pricing, Marketing, Irrigation water, Regions, Human population, Crops, Foods, Fiber crops, Reservoirs, Economics, Equations, Systems analysis, Optimization, Planning.
Identifiers: Interregional analysis, Cost minimization.

A study is presented of the optimum allocation of land and water resources in 223 agricultural land regions, 51 water supply regions, and 27 market regions of the United States. The study is built upon a family of programming models which incorporate all major U.S. agricultural commodities into a supply-demand and resource use interaction, and endeavors primarily to determine whether or under what conditions the nation has enough water to produce its future food and fiber requirements under urban and industrial water demands reflected in various levels and distributions of population and national economic activity in the year 2000. The amount of water used in agriculture is partly a function of the prices of water for irrigation; hence an auxiliary objective is to formulate models to reflect (normatively) the demand for water under different pricing policies. Analyzed are the impacts of future alternatives on the demand for water, such as water prices, population levels, farming technology, export quantities, and agricultural policies. In general, results show that, if agricultural and water development policies were changed over the future, the nation would not be faced with an overall water scarcity, and even surplus food producing capacity could exist with the use of less water for agricultural purposes. OUR WATER -- A PROBLEM CONCERNING THE STATE, INDUSTRY AND CITIZENS (UNSER WASSER -- EIN PROBLEM, DAS STAAT, INDUSTRIE UND BUERGER BETRIFFT).

Allgemeine Papier-Rundschau, No 33, p 1192, Aug. 21, 1972.

Descriptors: *Water supply, *Water management, *Water shortage, *Water resources development, Europe, *Consumptive use, *Water consumption, Water types, Surface waters, Groundwater, Spring waters, Capital, Loans, Investment, Governments, Federal government, State governments, Public utilities, Water distribution (Applied), Industrial water, Treatment facilities, Water quality control, Water requirements, Financing, Planning, Coordination.
Identifiers: *Germany.

In 1970, public water utilities in the German Federal Republic conveyed 4,218 million cu m of water, 3.9% more than in 1969. Surface waters accounted for 34% of this volume, with indications of further increases, while the proportion of spring waters dropped to 16.1%. The groundwater proportion remained constant at 50.2%. The daily per-capita consumption of domestic water increased to 119 liters for direct household use, but came to 222 liters, or 2.8% above the 1969 figure, per inhabitant of the areas supplied by West German water utility agencies. Industrial water requirements show a similar upward trend, aggravated by short-term peak demands, owing to production fluctuations in factories. The general need for expansion of public water supply facilities will require canalization investments of about 1.5 billion German marks before 1980, while treatment installations for water quality protection may call for a capital outlay of about 600 million marks. About 450 million marks annually may be needed for industrial water supply and treatment installations. Federal, state, and local cooperation are essential to meeting these diverse needs and to the speedy development of the essential plans and constructions. Easier loan policies and other measures are under consideration by the Bonn government. (Brown-IPC)

USE OF MIXED MEDIA IN WATER PLANT FILTRATION,
Mead Papers, Inc., Kingsport, Tenn.
J. K. Sullins.
In: TAPPI Environmental Conference, 1972. Proceedings of Meeting, Houston, Texas, May 14-17, 1972. TAPPI, Atlanta, Ga., p 75-79, 1972. 2 tab.

Descriptors: *Water purification, *Filters, Filtration, *Pulp and paper industry, *Tennessee, Treatment facilities, Water treatment, Freshwater, Industrial water, Pre-Treatment (Water), *Waste water treatment.

The planning, development, and installation of gradually improved water treatment facilities at the pulp and paper mill of the Mead Corp. at Kingsport, Tennessee, are described. The most recent improvement involved the conversion of two conventional gravity filters for river water to triple-media, high-rate filters. The advantages of the expended installation are outlined. THE DIMENSIONS OF COASTAL ZONE MANAGEMENT.

Proceedings of the Annual Meeting of the Coastal States Organization, Seattle, Washington, July 28-30, 1971. 167 p.

Descriptors: *Seashores, *Coasts, *Land management, *Legal aspects, Water quality control, Planning, Administration, Coastal engineering, Harbors, Shore protection, Jurisdiction, Continental shelf, Governmental interrelations, Land use, Coastal plains, Legislation.
Identifiers: *Coastal zone management.

Current status of coastal zone matters was reviewed from the viewpoints of the state, local, and federal governments. Also, the development of a state coastal zone legislative program as a model for the states to follow was a key purpose of the conference. Recent legislation passed in this area by both the states and the federal government was discussed. Of great concern to the states and federal governments is the continental shelf. In recent years the coastal states have become increasingly aware of the potential wealth in living non-living resources available near the shores. Also, water quality management and standards was discussed at length because of its close interrelationship to coastal zone management. The international aspects of coastal zone mangement and private industry's relationship to coastal zone management were also discussed. (Mockler-Florida)

THE DRAFT UNITED NATIONS CONVENTION ON THE INTERNATIONAL SEABED AREA--DEPARTMENT OF DEFENSE CONSIDERATIONS,
L. Finlay.
Natural Resources Law, Vol 4, p 84-87, January 1971.

Descriptors: *International law, *Beds, *Military aspects, *Treaties, *United Nations, Legislations, Continental shelf, Governments, Jurisdiction, Legal aspects, International waters, International commissions, Governmental interrelations, Law of the sea.
Identifiers: Territorial waters, Customary law.

The present Defense Department position relative to the Draft United Nations Convention on the International Seabed seeks to achieve a degree of absolute freedom beyond the 200-meter isobath that is unattainable. With respect to military uses of the seabed beyond the territorial sea, the U.S. would be much better off with a broad continental shelf governed by the Geneva Convention on the Continental Shelf and customary international law rather than under the August 3 draft treaty. Whether a particular unspecified military use qualifies as a high seas freedom will depend upon a balancing of the interests of the coastal state against the interests of the community of nations as a whole and not on the much used doctrine of creeping jurisdiction. Under the August 3 draft treaty, final decisions would be in the hands of a tribunal over whose membership the U.S. would have no control and whose decisions could not be flouted without being at odds with the entire international community. DEEP WATER PORTS.

Hearing--Subcomm. on Air and Water Pollution, Comm. on Public Works, U.S. Senate, 93rd Cong, 1st Sess, February 26, 1973. 93 p, 1 map.

Descriptors: *Federal Water Pollution Control Act, *Oil pollution, *Legislation, *Ports, Water pollution control, Comprehensive planning, Legal aspects, Harbors, Environmental engineering, Coasts, Oceans, Oil spills, Environmental effects, Governmental interrelations, State jurisdiction.
Identifiers: *Deepwater ports, *Congressional hearings.

S.180 and S.836 would amend the Federal Water Pollution Control Act in order to require the approval of adjacent coastal states prior to the construction of certain offshore facilities. The bills are aimed primarily at the construction of deepwater ports off the coast of the United States. The environmental impact on coastal areas adjacent to deepwater ports has only been dealt with sketchily to date with studies relying heavily on state and local control of land use. This proposal would insure that comprehensive studies at all levels of government be accomplished prior to initiation of construction. The proposals would amend title IV of the Federal Water Pollution Control Act by adding a section requiring that prior to federal licensing, approval, or construction of any ship docking, electric generating, or other facilities beyond the territorial sea, the approval of each adjacent coastal state which might adversely be affected by pollution from such facilities must be secured. The Environmental Protection Agency would be coordinate the program. S.180 would not apply to facilities constructed under leases pursuant to the Outer Continental Shelf Lands Act. (Mockler-Florida)
W73-13868

A BILL TO TERMINATE AND TO DIRECT THE SECRETARY OF THE INTERIOR AND THE SECRETARY OF THE NAVY TO TAKE ACTION WITH RESPECT TO CERTAIN LEASES ISSUED PURSUANT TO THE OUTER CONTINENTAL SHELF LANDS ACT.

House Bill No. 7500, 93rd Cong, 1st Sess (May 3, 1973). 6 p.

Descriptors: *United States, *Legislation, *Leases, *Condemnation, Energy, Legal aspects, Contracts, Water law, Water policy, Administration, Oil, Financing, Costs, Allotments, Federal government, Continental shelf.
Identifiers: Coastal zone management, Outer Continental Shelf Lands Act.

This bill terminates all leases and rights thereunder in the Santa Barbara Channel offshore of California issued pursuant to the Outer Continental Shelf Lands Act. The holder of any terminated lease may bring an action against the United States to secure compensation for the lease so terminated. The petroleum reserve account is created, and all payments in accordance with this act shall be made from that account. Funds for the account are to come from the sale of the United States share of the oil and gas extracted from Naval Petroleum Reserve Numbered 1. A national energy reserve is created on the Outer Continental Shelf in the Santa Barbara Channel, under the jurisdiction of the Secretary of the Interior. (Glickman-Florida)
W73-13869

A BILL TO AMEND THE FEDERAL WATER POLLUTION CONTROL ACT IN ORDER TO REQUIRE THE APPROVAL OF ADJACENT COASTAL STATES PRIOR TO THE CONSTRUCTION OF CERTAIN OFFSHORE FACILITIES.

Senate Bill No. 180, 92d Cong, 1st Sess, (January 4, 1973). 2 p.

Descriptors: *United States, *Coasts, *Federal Water Pollution Control Act, *Legislation, *Governmental interrelations, Construction, Governors, State governments, Oceans, Pollution abatement, Environmental effects, International waters.
Identifiers: Coastal waters.

S.180 would amend the Federal Water Pollution Control Act in order to require the approval of adjacent coastal states prior to the construction of certain offshore facilities. The bill requires that consideration be given to the environmental effects of construction beyond the territorial sea off the coast of the U.S., of ship docking, electric generating and other facilities. Since adjacent states may be adversely affected by pollution from such facilities, approval of any states which may be so affected is required before any such facilities are constructed. Reports are to be filed with the Environmental Protection Agency with respect to such facilities. The reports are to be forwarded to the Governors of the states concerned which might be adversely affected by pollution or related consequences of such facilities. If any governor fails to file approval or disapproval of the proposal within 90 days of receipt of sail report such inaction will be considered approval. (Napolitano-Florida)
W73-13870

A BILL TO PROHIBIT DISCHARGE INTO ANY NAVIGABLE WATERS OF ANY MILITARY WITHOUT CERTIFICATION BY THE ENVIRONMENTAL PROTECTION AGENCY.

House Bill 2494, 93rd Cong, 1st Sess (1973). 2 p.

Descriptors: *Legislation, *International waters, *United States, *Waste disposal, Military aspects, Biological warfare, Chemical warfare, Radioactive waste disposal, Chemical wastes, Water pollution sources, Chemicals, Legal aspects, Permits.

H.R. 2494 would prohibit any person from discharging, into any of the navigable waters of the United States or into international waters any munition, or any chemical, biological or radiological warfare agent, or any other military material, or any other refuse matter of any kind or description except in accordance with a certificate issued by the Environmental Protection Agency. (Reed-Florida)
W73-13871

A BILL TO AMEND THE FEDERAL WATER POLLUTION CONTROL ACT.
Senate Bill 836, 93d Cong, 1st Sess (1973). 3 p.

Descriptors: *United States, *Federal Water Pollution Act, *Legislation, *Governmental interrelations, Construction, Governors, Administrative agencies, State governments, Oceans, Pollution abatement, Oil pollution, Water pollution control.
Identifiers: Territorial waters.

S.836 would amend the Federal Water Pollution Control Act in order to require approval by Congress and by adjacent coastal states prior to construction of offshore facilities. Congress found that certain facilities being considered for construction offshore such as deep draft oil docking, electric generating plants and oil drilling facilities have a potential for creating massive pollution problems for adjacent coastal states. No federal agency is to construct or approve construction of any facility of any kind in the territorial waters off the coast of the U.S. until (1) such agency files a complete report with respect to the proposed facility with the Environmental Protection Agency; (2) the Administrator forwards the report, with his own comments to the House and the Senate and to the Governor of each adjacent coastal state concerned; (3) Congress enacts a law approval. If no notice is filed within 90 days of receipt of report, approval is assumed. (Napolitano-Florida)
W73-13872

PREPARATION OF ENVIRONMENTAL IMPACT STATEMENTS--PROPOSED GUIDELINES, PART II.
Council on Environmental Quality, Washington, D.C.

Federal Register, Vol 38, No 84, p 10856-10866, May 2, 1973. 3 append.

Descriptors: Planning, *Projects, Evaluation, *Environmental effects, Reviews.
Identifiers: *Environmental impact statements, *Environmental guidelines.

Included in the proposed guidelines for the preparation of environmental impact statements are procedures for revision and modification of present guidelines relative to which actions require statements, information required in their preparation, officials responsible, who may be consulted in their preparation and what information is to be made public. Also included are guidelines as to what constitutes a major action significantly affecting the human environment, the procedures to be followed in the actual preparation of draft statements and hearings thereon, the content of statements, the agencies that are to review the statements, the preparation and circulation of the final statements, and their final distribution. (Wadley-Florida)
W73-13873

A BILL TO BE ENTITLED AN ACT DEFINING AND RELATING TO THE MANAGEMENT AND PROTECTION OF INLAND AND COASTAL WETLANDS.

Fla. House Bill No 1789 (Feb. 1973).

Descriptors: *Florida, *Legislation, *Land management, *Wetlands, Recreation, Erosion control, Absorption, Navigable waters, Ecosystems, Aquatic life, Coasts, Intertidal areas, Land use, Zoning, Estuaries, Land development, Conservation.
Identifiers: *Coastal zone management.

This bill defines coastal and inland wetlands and provides for their management and protection. It authorizes an administration commission to designate inland and coastal wetlands as areas of critical state concern and sets forth guidelines to aid in the designation of such critical areas. Once a wetland area is designated as an area of critical state concern, development shall only be done in accord with Section 380.05 Florida Statutes. The bill provides for interim controls on development,

that is,the carrying out of any building or mining, or the making of any material change in the use or appearance of the area, for a period of one year or until the local government passes equitable regulations for the guidance of development. A severability clause and an effective date are included. (Napolitano-Florida)
W73-13874

UNITED STATES V. KENNEBEC LOG DRIVING COMPANY (LOG DRIVING ON NAVIGABLE RIVER PERMITTED UNDER THE RIVERS AND HARBORS ACT).

356 F. Supp. 344-353 (D. Maine, S.D. 1973). 10 p.

Descriptors: *Lumbering, *United States, *Navigable waters, *Rivers and Harbors Act, Legal aspects, Judicial decisions, Legislation, Pulp and Paper industry, Navigable rivers.
Identifiers: *Navigation obstructions, Injunctive relief.

The United States, under the Rivers and Harbors Act of 1899, sought to enjoin the defendant companies from engaging in log driving on a navigable river. The government alleged that the log driving obstructed navigation on the river and that the settling on the bottom of water soaked logs and bark was, in the absence of a permit from the Secretary of the Army, and unlawful deposit of refuse matter. The defendant's position was that the Act did not prohibit their operation since section 410 of the Act provided essentially that the prohibition against the floating of timber does not apply in waterways where such floating of loose timber and logs is the principal method of navigation. The court reviewed the legislative history of the Act and found that section 410 had been specifically added to allow the continuance of operation such as those in question. As to the sloughage of bark and logs, the court found that since Congress had authorized the continuance of log driving, it would be folly to suggest that Congress had meant to avoid the inherent side effects accompanying such operations. Thus, summary judgment was entered for the defendants. (McKnight-Florida)
W73-13875

UNITED STATES EX REL. SCOTT V. UNITED STATES STEEL CORP. (ACTION TO RESTRAIN STEEL COMPANY FROM DISCHARGING WASTE WATER INTO LAKE MICHIGAN).

356 F. Supp. 556-560 (N.D. Ill., E.D. 1973).

Descriptors: *United States, *Common law, *Federal Water Pollution Control Act, *Pollution abatement, *Rivers and Harbors Act, Illinois, Federal government, Legislation, Governmental interrelations, Navigable waters, Lake Michigan, State governments, Waste water (Pollution), Industrial wastes, Permits, State jurisdiction, Federal jurisdiction, Waste water disposal.
Identifiers: *Injunctive relief, Nuisance (Legal aspects), Standing (Legal).

Plaintiffs Illinois state and federal governments filed a complaint to restrain defendant steel producer from discharging waste water into Lake Michigan. Both governments sought to abate a federal common law nuisance. The United States also alleged a violation of the Refuse Act. Defendant contended the 1972 amendments to the Federal Water Pollution Control Act had precluded common law jurisdiction and superseded the Refuse Act and that a Refuse Act permit to dump waste in non-navigable waters could not be secured as this was ultra vires for the Corps of Engineers. The U.S. District court held that a state can enforce federal common law, the United States has standing to abate a common law nuisance, and the amended Federal Water Pollution Control Act doesn't abolish the common law of nuisance nor supersede the Refuse Act. Also the court held that since the ultra vires permit ruling was being appealed it wasn't ripe for use as an affirmative defense. A pendant state claim which sought to abate a common law nuisance under state law was dismissed by the court. (Wehby-Florida)
W73-13876

STATE V. ST. REGIS PAPER COMPANY (ADMINISTRATIVE HEARING NOT CONDITION PRECEDENT TO SUIT BY STATE FOR WATER POLLUTION DAMAGES).

275 So. 2d 21-23 (D.C.A. Fla. 1973).

Descriptors: *Florida, *Adjudication procedure, *Pollution abatement, *Damages, Water pollution, Legal aspects, State governments, Judicial decisions, Oil spills, Oil pollution, Water pollution control, Remedies, Legal review, Legislation, Administrative agencies.

Plaintiff, State Department of Pollution Control, sought compensation for damages to a river caused by defendant paper company's oil spillage. The circuit court dismissed the complaint holding that the plaintiff must first conduct an administrative hearing. On appeal, the Florida District Court of Appeals, First District, reversed, holding that Florida Statutes section 403.141 authorizes the Department of Pollution control to institute forthwith and without prior administrative proceeding a civil action to recover damages caused by an unlawful and negligent discharge of contaminants into the waters of the state. (Napolitano-Florida)
W73-13877

U.S. V. AMERICAN CYANAMID COMPANY (CRIMINAL PROSECUTION FOR WASTE DISCHARGES IN VIOLATION OF THE REFUSE ACT).
354 F. Supp. 1202-1205 (S.D.N.Y. 1973).

Descriptors: *United States, *Rivers and Harbors Act, *Judicial decisions, *Industrial wastes, Law enforcement, Water pollution sources, Waste disposal, Wastes, Environmental sanitation, Public health, Navigation, Permits, Tidal waters, Navigable waters, Penalties (Legal).
Identifiers: *Refuse Act, Navigability tests, Scienter, Criminal law.

The United States brought this criminal prosecution against the defendant chemical company for discharging industrial wastes into a tributary of a navigable water in violation of the Refuse Act of 1899, or section 13 of the Rivers and Harbors Act. Defendant contended the statute was only applicable to the discharges tending to obstruct navigation, that the receiving stream was not navigable, that scienter was lacking and that the absence of a waste discharge permit program under the Act precluded this criminal prosecution. The U.S. District Court held that obstruction to navigation is not an essential element for violation of the Refuse Act, scienter is not required, the receiving stream was a tributary of a navigable water and thus protected by the Act and that the nonexistence of a discharge permit program was irrelevant with respect to defendant's prosecution where the discharges were accidental and no permit would have been sought in any event. Defendant was judged guilty. (Mockler-Florida)
W73-13878

ASKEW V. AMERICAN WATERWAYS OPERATORS, INC. (CONSTITUTIONALITY OF FLORIDA'S OIL-SPILL PREVENTION AND POLLUTION CONTROL ACT).

93 S. Ct. 1590-1601 (1973).

Descriptors: *United States, *State jurisdiction, *Judicial decisions, *Legislation, *Oil spills, Florida, Legal review, Oil pollution, Constitutional law, Penalties (Legal), Disasters, Water pollution sources, Water pollution control, Federal jurisdiction, Damages, Governmental interrelations.
Identifiers: *Water Quality Improvement Act of 1970, *Florida Oil-Spill Prevention and Pollution Control Act, Absolute liability.

Plaintiffs, merchant shippers, members of the Florida coastal barge and towing industry, and owners and operators of oil terminal facilities had obtained an injunction enjoining defendants, state officials, from enforcing the Florida Oil-Spill Protection and Pollution Control Act on the ground that it was an unconstitutional intrusion into the federal maritime domain as Congress had, prior to the Florida Act, enacted the Water Quality Improvement Act of 1970. The U.S. Supreme Court, in finding for the defendant, upheld the Florida Act, which provided for the state's recovery of clean-up costs and imposed strict, no-fault liability on waterfront oil-handling facilities and ships destined for or leaving such facilities for any oil-spill damage to the state or private persons. The Court held that the Florida Act did not invade a regulatory area preempted by the federal act, which was concerned solely with the recovery of actual cleanup costs to the federal government and which presupposed a coordinated federal-state effort to deal with coastal oil pollution. (Reed-Florida)
W73-13879

JEFFERSON NATIONAL BANK AT SUNNY ISLES V. METROPOLITAN DADE COUNTY (OWNERSHIP OF FILL PLACED BEYOND BULKHEAD LINE).

271 So. 2d 207 (Fla. App. Ct. 1972).

Descriptors: *Florida, *Bays, *Riparian rights, *Navigable waters, *Bulkhead line, Legal aspects, Water law, Water rights, Water policy, Legislation, Judicial decisions, Local governments, Artificial watercourses, Permits.
Identifiers: *Fill permits.

Appellant riparian landowner extended his property into a bay by means of filling, beyond an officially established bulkhead line, without permit, and free of state or county control. Appellant sought a declaratory judgment against appellee County declaring him to be owner of the filled land. Appellee averred that the appellant's extension of property into the bay was precluded by a 1951 decree which fixed the bulkhead line, beyond which the riparian owner could not fill without a permit. In addition, a state statute which made no distinction between natural or artificially created navigable waters directed that before such a land extension could be made, a permit had to be obtained from the County. The court held that this statute took precedence over a statute which indicated that if the bay was artificially created, a riparian owner could extend his land into the bay by filling, without a bulkhead line having been fixed by the County. In addition, since a bulkhead line had been fixed, the upland owners were precluded from extending their lots by fill beyond that point. Also, the county commission could order appellant to remove the fill. (Glickman-Florida)
W73-13880

UNITED STATES V. ROHM AND HAAS COMPANY (ACTION TO ENJOIN INDUSTRIAL DISCHARGE INTO HOUSTON CHANNEL UNDER THE REFUSE ACT).

353 F. Supp. 993-996 (S.D. Tex. 1973).

Descriptors: *United States, *Rivers and Harbors Act, *Federal Water Pollution Control Act, *Industrial wastes, *Remedies, *Water quality standards, Legislation, Navigable waters, Effluents, Wastes, Water pollution sources, Liquid wastes, Waste water (Pollution), Water pollution, Water quality control, Judicial decisions, Law enforcement, Permits.
Identifiers: *Refuse Act, Effluent limitations.

Plaintiff United States sought to enjoin the defendant corporation from discharging refuse materials into the Houston Ship Channel in violation of the Refuse Act. Defendant contended that it was immune from suit under the Federal Water Pollution Control Act of 1972 since it had applied for a waste discharge permit. The U.S. District Court held that the Federal Water Pollution Act did not bar the suit. The court concluded that the Houston Ship Channel was a navigable water within the meaning of the Refuse Act, and that defendant was in violation of that act by daily discharging effluent wastes into the channel. The court enjoined defendant from further discharge in excess of prescribed daily amounts determined from expert testimony elicited during the course of the trial. The court also enjoined defendant from increasing the amount of waste materials disposed of by deep well injection. (Glickman-Florida)
W73-13881

UNITED STATES V. CONSOLIDATION COAL COMPANY (INJUNCTION TO STOP DEFENDANT'S DISCHARGE OF WASTES INTO NAVIGABLE WATERS UNDER THE REFUSE ACT).

354 F. Supp. 173-179 (N.D. W.Va. 1973).

Descriptors: *United States, *Rivers and Harbors Act, *Federal Water Pollution Control Act, *Legislation, Water pollution control, Navigable waters, Effluents, Wastes, Water pollution sources, Industrial wastes, Navigable rivers, Judicial decisions, Remedies, Waste disposal, Permits, Law enforcement, Penalties (Legal).
Identifiers: *Refuse Act, Injunctive relief.

The United States sought a permanent injunction against defendant coal company's discharge of effluent wastes into a tributary of a navigable water. The U.S. alleged that defendant discharged refuse in violation of section 13 of the Rivers and Harbors Act, the Refuse Act of 1899. Defendant answered that the Refuse Act was a navigation and not a pollution statute, and thus was not intended to control the discharge of industrial wastes. Defendant further maintained that since it had applied for a waste discharge permit, it couldn't be sued while the application was pending. The court rejected the defendant's contention and held that the Refuse Act extended to any discharge of any refuse matter regardless of its effect on navigation. It further held that injunctive relief was an appropriate remedy for enforcement of the Refuse Act, and that even though defendant had applied for a waste discharge permit, it was not immune from suit since the prosecution was initiated before the exception for pending permit applications was enacted in the Federal Water Pollution Control Act of 1972. The court therefore overruled defendant's motion to dismiss. (Glickman-Florida)
W73-13882

CONSERVANCY DISTRICTS FURNISHING WATER SUPPLY.

Ind. Ann. Stat. secs. 27-1601 thru 27-1621 (1970).

Descriptors: *Water supply, *Legislation, *Indiana, *Public utilities, Administration, Legal aspects, Water resources development, Governmental interrelations, Jurisdiction, Water rates, Government finance, Water districts, Water distribution (Applied), Water utilization.

An order of the court establishing a conservancy district or an order of the court adding the purpose of furnishing water for domestic, industrial and public use shall be deemed to grant to the conservancy district territorial authority to render the service of water supply conterminous with the boundaries of the conservancy district. Its authority shall include the power to acquire, maintain, and operate a source of water outside the boundaries of the district when permission to do so is granted by the Indiana Public Service Commission. The statutes also provide that in the event a conservancy district is established for the purpose of furnishing water supply for domestic, industrial and public use, or such purpose is added to a conservancy district and there is within the boundaries of such conservancy district a municipality or public utility providing water supply to part of the territory, the order of the court shall be deemed authority only for that territory within the boundaries not served by the municipality or public utility. (Mockler-Florida)
W73-13883

RESERVOIR SITES FOR STORAGE OF WATER.
Ind. Ann. Stat. secs. 27-1901 thru 27-1917. (1970).

Descriptors: *Indiana, *Legislation, *Reservoir operation, *Eminent domain, *Water storage, Water demand, Water management (Applied), Water supply, Reservoir storage, Usable storage, Flood control, Condemnation, Easements, Reservoirs.

The Indiana flood control and water resources commission is granted the authority to purchase or condemn easements or fee simple interests in land necessary for reservoirs for storage of water. The commission is further authorized to construct and otherwise develop necessary structures for impoundment of water on such sites. The owner of the land from which such an easement is taken, or from which the remainder interest in fee simple is taken, shall have the right to use and enjoy the land in any way consistent with the rights of the holder of the easement of remainder interest in fee simple. The owner may use the land for agricultural, recreational, or other purposes, but any such use shall be subject to the dominant purpose of storage of water. The statutes also provide that the Reservoir Coordinating Committee shall coordinate the planning and development of reservoirs for the purposes of flood control, water supply, water quality control, recreation, and related water resources purposes. (Mockler-Florida)
W73-13884

JURISDICTION OVER VARIOUS DRAINS AND EXEMPTIONS.
Ind. Ann. Stat. secs. 27-2201 (1970).

Descriptors: *Legislation, *Indiana, *Drains, *Drainage districts, Drainage systems, Water policy, Water control, Flow control, Water sources, Water reuse, Local governments, Flood control.

The statutes provide that each legal drain in a county in Indiana shall be under the jurisdiction of the board and subject to the provisions of this act. However, the construction and maintenance of that part of a legal drain located within a conservancy district which has been designated for construction or maintenance in the final plan of the district, and which plan has been approved by the court before the effective date of the act shall not be subject to the provisions of the act. In addition whenever a legal drain which is subject to the provisions of the act is included in a flood control project which has been approved by the department of natural resources, such drain shall cease to be subject to the provisions of the act and the responsibility for reconstructing or maintaining such drain shall be the responsibility of the local agency responsible for constructing or maintaining the approved flood control project. Private and mutual drains are not subject to this act unless the owners of land affected request otherwise. However, lands drained by a private or mutual drain may be subject to assessment for improvements made to a legal drain if such lands are also drained by the legal drain. (Mockler-Florida)
W73-13885

RIGHTS OF WAY—OBSTRUCTIONS—CROSSINGS—CONNECTIONS.
Ind. Ann. Stat. secs. 27-2301 thru 27-2310 (1970).

Descriptors: *Indiana, *Legislation, *Obstruction to flow, *Drainage, *Drains, Water control, Outlets, Drainage systems, Controlled drainage, Water management (Applied), Drainage programs, Flow control, Easements, Right-of-way.

These statutes cover rights-of-way on private lands and the restrictions on their use, obstruction of drains by the owners of the lands, public utilities, pipeline compaines, construction of drains near levees, drains crossing public highways, construction of drains which deprive owners of ingress or egress to tracts of land, and inadequate private crossings. The statutes set out specific requirements governing the connection of private drains with legal drains, the construction or extension of private or mutual drains, and the reconstruction of drains made inadequate by a change of land use. The statutes specifically provide that if any obstruction or damage has been caused by an owner of land affected by the drain, the board may, after a hearing brought on by written notice served on the owner, add an amount sufficient to pay for such damage to the next annual assessment made against the lands of such owner. (Mockler-Florida)

CLAFLIN V. STATE DEPARTMENT OF NATURAL RESOURCES (REVIEW OF DENIAL BY DEPARTMENT OF NATURAL RESOURCES OF AN APPLICATION FOR PERMIT FOR STRUCTURE IN LAKE).
206 N.W. 392-298 (Wis. 1973).

Descriptors: *Water rights, *Judicial decisions, *Wisconsin, *Legal aspects, Environmental effects, Navigation, Permits.

An application for a permit to construct a boathouse on a lake was denied by the Wisconsin Department of Natural Resources (Department) and an appeal was taken. On appeal it was held improper for the Department to apply a rule relative to such boathouses that was adopted after the hearings on the permit application but prior to final disposition of the issue by the Department. The case was remanded by the court for a new determination on whether to issue the permit based on whether this particular boathouse, in this precise situation, is detrimental to the public interest. Such a determination may give weight to such factors as the effect the boathouse will have on natural beauty, on navigability or on the effective flood flow. (Wadley-Florida)
W73-13887

RIVER REGULATION BY STORAGE RESERVOIRS.
New York Sess. Laws, Ch. 664, Secs. 15-2101 thru 15-2141 (McKinney 1973).

Descriptors: *New York, *Legal aspects, Reservoirs, *Reservoir storage, Impoundments, *River regulation.
Identifiers: Legislation.

River regulations districts are created to supervise the construction, operation and maintenance of reservoirs for the purpose of regulating the flow of streams when such is required by the public health, safety and welfare. The powers and duties

uch districts are specified and procedures for
struction of reservoirs are included. Other
visions deal with financing, operation of the
rvoirs, hearings, reports, operation and main-
ance, charges, cost apportionment and taxa-
. (Wadley-Florida)

RAHM V. DIAMOND (REVIEW OF GRANT CERTIFICATE FOR CONSTRUCTION OF A DROELECTRIC PLANT).

N.Y.S.2d 84-98 (N.Y. 1973). 15 p.

criptors: *New York, *Hydroelectric project
nsing, *Water quality standards, *Administra-
decisions, Administrative agencies, Govern-
ital interrelations, Judicial decisions, Saline
er intrusion, Thermal pollution, Environmental
ects, Legal review, Hydroelectric plants, Hud-
river, State jurisdiction, Federal Water Pollu-
Control Act, Permits.
ntifiers: Administrative regulation.

intiffs conservation groups sought review of
issuance by the Environmental Conservation
nmissioner of a certificate that the proposed
struction of a pumped storage hydroelectric
ility on the Hudson River would not violate ap-
able water quality standards. Plaintiffs charged
t the Commissioner had acted arbitrarily and
riciously in certifying that the project would
violate water quality standards and also that he
failed to consider several relevant matters in
king his determination. The court recognized
t the Federal Water Pollution Control Act
nquished to the states only a narrow authority
determine whether there is reasonable as-
ance that the water quality standards of the
e are not violated and that the states were not
en authority to consider matters within the ju-
diction of the Federal Power Commission. The
rt therefore found that the Commissioner had
rectly considered all relevant factors within his
sdiction and that his decision was reasonable.
e court reviewed the Commissioner's specific
ding as to the effect on fish life, saltwater intru-
n, and possible thermal pollution and concluded
t all were supported by the facts. (McKnight-
rida)
3-13889

ISAFULLI V. STATE (SUIT FOR FLOOD MAGES ALLEGEDLY CAUSED BY STATE'S ILURE TO OPEN FLOODGATES).

N.Y.S.2d 138-140 (App. Div., 4th Dep't. 1973).

scriptors: *New York, *Flood damage, *Flood
ntrol, *Water management (Applied), Legal
ects, Judicial decisions, Drainage engineering,
ainage programs, Floodgates, Damages,
ainage patterns (Geologic), Surface drainage.

intiffs, owners of muck farms, brought suit
inst the state of New York for damages due to
oding. The plaintiffs alleged that they were
naged by waters backing up in a creek which
ined their lands due to the failure of the state to
en flood gates downstream. The state presented
dence showing that the plaintiffs' land was
ht feet higher than the river water at the flood
es and this was unrebutted by the plaintiffs.
e appellate court thus found that since water
m the river could not flow uphill to reach the
intiff's land, the trial court's verdict for the
intiffs was against the weight of the evidence.
e appellate court therefore reversed the
dgment and ordered a new trial. (McKnight-
rida)

WATER POLLUTION CONTROL.
N.Y. Sess. Laws, Ch. 664, Secs. 17-0101 through 17-0303 (McKinney 1973).

Descriptors: *New York, Legislation, Water quality, *Regulation, Legal aspects, *Water pollution control, *Permits, Sewage treatment, Waste treatment.
Identifiers: Marine toilet.

It is the public policy of the State of New York to maintain reasonable standards of water purity consistent with public health and public enjoyment of the waters of the state, to protect fish and wildlife, and to promote the industrial development of the state. This legislation is designed to prevent new water pollution and to abate existing pollution under a program consistent with the stated policy. The powers of the New York State Health Department, relative to carrying out the stated policy are detailed. Also included are provisions dealing with permits, certificates, procedures, marine toilet pollution control devices and standards, realty subdivisions, sewerage service and discharge of sewage into waters. (Wadley-Florida)
W73-13891

SOUTH COUNTY DRAINAGE DISTRICT V. BREVARD COUNTY (APPEAL BY DRAINAGE DISTRICT FROM JUDGMENT DENYING DISTRICT'S PRAYER FOR PERMISSION TO AMEND ITS PLAN OF RECLAMATION).

277 So. 2d 31-34 (1st D.C.A. Fla. 1973). 4 p.

Descriptors: *Florida, *Legal aspects, Judicial decisions, Drainage, Water management (Applied), *Drainage districts.

On appeal from an adverse decision of the circuit court, the District Court of Appeals held that the failure of the drainage district to publish in the appropriate county a notice of drainage hearings to be held on the district's petition to extend its boundaries into that county invalidated that part of the district's order purporting to so extend the boundary lines even though the proposed extension was made of the request of and with the consent of the only affected landowner in that county whose property would be included. (Wadley-Florida)
W73-13892

ORANGE COUNTY AUDUBON SOCIETY, INC. V. HOLD (STANDING OF CONSERVATION GROUP TO SUE AS CITIZEN).
276 So. 2d 542-544 (Fla. D.C.A. 1973). 3 p.

Descriptors: *Florida, *Remedies, *Regulation, *Jurisdiction, *Legislation, Judicial decisions, Water law.

An incorporated conservation organization brought an action against the Board of County Commissioners to compel enforcement of environmental laws. The circuit court dismissed for lack of standing to maintain the action. On appeal, it was held that the term 'citizen' in an act making the protection of the environment a collective responsibility and providing a procedure whereby governmental bodies could be compelled to enforce applicable laws included artificial persons as well as natural persons. Since corporations are artificial persons, they have standing to sue. (Wadley-Florida)
W73-13893

ROBERTS V. BREWER (BILL IN EQUITY TO ABATE ALLEGED NUISANCE).
276 So. 2d 574-583 (Ala. 1973). 10 p.

Descriptors: *Alabama, *Judicial decisions, *Legal aspects, *Water law, Dams, Water rights, Flood control.

Plaintiff brought an action to abate an alleged nuisance in the nature of Beaver dams. The dams backed water onto plaintiff's property and destroyed trees. Most of the water backed up by the primary dam was on land of a third party, not a party in the suit. It was held that a third party cannot be deemed to acquire an interest in the maintenance of a nuisance injurious to another merely because abatement of the nuisance might affect in some way the property of such third party. As the complainant was a riparian on the dammed stream and had the right thereby to have the water flow by without obstruction or alteration, including at its natural level, any obstruction that results in unnatural enlargement gives the upper proprietor a right of action. Although defendant had no legal liability to remove the dam, it was held that complainants be allowed to enter the land and remove the dam themselves. (Wadley-Florida)
W73-13894

STATE, DEPARTMENT OF CONSERVATION V. SHERIFF (APPEAL FROM JUDGMENT ENJOINING DEFENDANT FROM PLACING FILL IN A LAKE BED).
207 N.W.2d 358-360 (Minn. 1973). 3 p.

Descriptors: *Minnesota, *Judicial decisions, *Legal aspects, *Landfills, Legislation, High water mark.
Identifiers: Fill permits.

In 1962, application was made for permit to place fill upon lake bed below established high water mark. No appeal was taken at that time from denial of the permit. Eight years later, defendant was discovered dumping fill into the lake, and the state obtained an order enjoining and restraining defendant from depositing fill. On motion for summary judgment, defendant was ordered to remove fill previously placed and permanently enjoined from depositing more fill below ordinary high water mark. On appeal, the court held that defendant's proper course of action to contest state allegation that such fill was detrimental to public interest or benefit was to appeal from the 1962 denial of permit application. Since no such appeal was taken defendant is not entitled to a redetermination of that issue. To order defendant to remove all fill held too broad and court ordered only that fill deposited after 1962 be removed. (Wadley-Florida)
W73-13895

CITY OF MATTOON V. ILLINOIS ENVIRONMENTAL PRO. AGCY. (PETITION FOR REVIEW OF ORDER OF POLLUTION CONTROL BOARD).

296 N.E.2d 383-387 (Ill. Ct. App. 1973). 5 p.

Descriptors: *Illinois, *Judicial decisions, Legal aspects, Public health, Legislation, Standards, Penalties (Legal), Water pollution control.

The defendant Pollution Control Board (Board) ordered plaintiff city to submit plans and specifications for sewage facilities and to construct such facilities by a specified date. The city failed to timely submit the required plans and was fined by the Board. The court held that the action exceeded the Board's statutory authority. Holding in favor of the city, the court ruled that the Board might pursue enforcement procedures with respect to the city's variance petition seeking temporary relief from the regulation only if a grant of such power was explicit in the statute. Here none was found. Further, in this case, no complaint was ever filed upon the city as required by statute, nor were the notice provisions of the statutes complied with. (Wadley-Florida)
W73-13896

CITY OF WAUKEGAN V. ENVIRONMENTAL PROTECTION AGENCY, ETC. (APPEAL FROM ORDER OF POLLUTION CONTROL BOARD ASSESSING FINES AGAINST CITY AND CORPORATION).
296 N.E.2d 102-112 (Ill. Ct. App. 1973). 11 p.

Descriptors: *Illinois, *Judicial decisions, Legal aspects, Penalties (Legal), Water pollution control, Waste disposal.

The Illinois Pollution Control Board (Board) assessed a fine of one thousand dollars against the City of Waukegan for operating a refuse disposal site without a permit, for allowing open dumping, creating a water hazard and for failing to provide daily cover for the refuse. On appeal from the decision of the Board, the court held that such a determination by the Board constituted an unlawful delegation of judicial power to an administrative agency since the imposition of a discretionary fine (as is the case here) is clearly a judicial act. The part of the Environmental Control Act authorizing such a procedure is thereby void. (Wadley-Florida)
W73-13897

DE RAHM V. DIAMOND (SUIT TO REVIEW AGENCY'S ISSUANCE OF A CERTIFICATE OF 'REASONABLE ASSURANCE' THAT PROPOSED CONSTRUCTION OF FACILITIES ON A RIVER WILL NOT VIOLATE WATER QUALITY STANDARDS).
295 N.E.2d 763-773 (N.Y. 1973). 11 p.

Descriptors: *New York, *Legal aspects, *Water quality control, Pollution abatement, Water pollution control, *Water quality standards.

As required by applicable federal law, Consolidated Edison applied for and received a certificate of reasonable assurance that New York state water quality standards would not be violated by the proposed project. Conservation groups appealed for a review of the certificate and the Supreme Court set aside the determination. On appeal of that decision to the Court of Appeals, it was held that the record established that the commissioner gave due consideration to every factor which had a bearing on the applicable water quality standards and the determination was therefore rational and reasonable. Specifically, factors included the possibility of thermal pollution, salt water intrusion, danger to fish life, and possible pollution discharges into the aqueduct. (Wadley-Florida)
W73-13898

MOLOKAI HOMESTEADERS COOPERATIVE ASS'N. V. MORTON (ACTION FOR PRELIMINARY INJUNCTION TO PREVENT BOARD OF LAND AND NATURAL RESOURCES FROM ENTERING INTO AGREEMENT WITH CORPORATION FOR USE OF PIPELINE).
356 F. Supp. 148-153 (D. Hawaii 1973). 6 p.

Descriptors: *Hawaii, Legal aspects, Judicial decisions, *Irrigation districts, Irrigation systems, Pipelines.
Identifiers: *Environmental impact statements.

The court denied an application for a preliminary injunction to prevent the Hawaii Board of Land and Natural Resources from entering into an agreement with private corporations to use the pipeline and facilities of the Molokai irrigation system. The reason for the denial was that plaintiffs failed to show irreparable injury from the proposed action. In so holding, the court concluded, among other things, that since the action proposed is not federal in nature, relevant provisions of the National Environmental Policy Act requiring an impact statement were not applicable. (Wadley-Florida)

WATER MANAGEMENT--BASIC ISSUES.
Organization for Economic Co-Operation and Development, Paris (France).

1972. 546 p.

Descriptors: *Water management (Applied), *International commissions, *Water resources development, *Conferences, Documentation, Economics, Legal aspects, Administration, Planning, Environment, Technology, Ecology, United States, Canada, Europe, Water quality control.
Identifiers: Japan.

The Water Management Research Group, now renamed the Water Management Sector Group under the Environment Committee of the Organization for Economic Cooperation and Development (OECD), was established in 1967 and has held a series of meetings. This report contains the papers presented at the North American meetings of the Group, July 15-24, 1970. The papers discuss water management problems related to environment in Canada and the United States from scientific, technological, administrative, legal, and economic viewpoints; and provide comparisons with methods used in other member countries. The papers are grouped in five parts: part I, North American water policies and programs; part II, basin and regional programs in North America, part III, water resources research in North America; part IV, joint United States-Canadian programs; and part V, illustrations of European and Japanese approaches to solving basic problems in water management. The papers are published in the original language of submission. (See W73-13917 thru W73-13959) (Woodard-USGS)

STATEMENT,
Department of the Interior, Washington, D.C.
W. J. Hickel.
In: Water Management--Basic Issues; Organization for Economic Cooperation and Development, Paris, France, p 21-22, 1972.

Descriptors: *Water management (Applied), *Water resources development, *Conferences, *Water policy, Social aspects, Recreation, Water demand, United States, Planning, Economic aspects, Water pollution control, Ecology, Water supply, Water quality control.

The subjects and case studies presented are of mutual concern to all mankind: water resources of the world are limited and need to be carefully managed. Based on a recent national assessment of water resources prepared by the Water Resources Council, the United States realizes that there is still much to learn in order to manage this vital resource to its best advantage. STATEMENT,
Organization for Economic Co-Operation and Development, Paris (France).
G. Eldin.
In: Water Management--Basic Issues; Organization for Economic Cooperation and Development, Paris, France, p 25-26, 1972.

Descriptors: *Water management (Applied), *Water resources development, *Conferences, *Water policy, Social aspects, Recreation, Water demand, United States, Planning, Economic aspects, Water pollution control, Ecology, Water supply, Water quality control.

The objectives of the Organization for Economic Development (OECD) Water Management Research Group meeting held in North America, the results of which are described in this report, were to examine water-management problems in relation to the environment in the United States and Canada, and to compare the methods used in these countries with those adopted in other OECD countries. In directives issued in May 1970, the OECD Council of Ministers considerably broadened the scope of this work and set it along a new course. On that occasion, Ministers, upon fixing quantitative growth targets during the decade 1970 to 1980 for OECD countries as a whole, stressed the importance of the qualitative aspect of economic growth and more especially the great value of preserving and improving environmental quality. They recommended that the Organization so extend its environmental work as to assess the economic and trade implications of environmental policies, relate these activities to the broader objectives of economic and social development and suggest concerted solutions to problems with substantial international implications. UNITED STATES WATER POLICY,
Department of the Interior, Washington, D.C.
J. R. Smith.
In: Water Management--Basic Issues; Organization for Economic Cooperation and Development, Paris, France, p 41-46, 1972.

Descriptors: *Water management (Applied), *Water policy, *United States, *Water resources development, Planning, Social aspects, Economic aspects, Water quality control, Pollution abatement, Ecology, Water supply, Water utilization, Reviews, Evaluation, Federal Government, Recreation.

The objectives of planning for the use and management of water and related land resources should be on a broader basis than just increasing the output of goods and services. Studies are now under way to provide for multiple objective approach. Under this proposal, the objectives would be not only the national economic development but would include on an equal basis enhancement of the environment by conservation, preservation, creation, restoration, or improvement of the quality of natural, scenic, biological, geological, and cultural resources; enhancement of the social well-being of persons, groups, and communities, including the geographic distribution of population and employment in relation to national goals and the attainment of an urban-rural balance; and recognition of regional aspects of water resources development, including evaluation of enhancement of regional development through increases in income and employment, and improvement of its economic base, environment, and social well-being. (See also W73-13916) (Knapp-USGS)
W73-13919

RECENT DEVELOPMENTS IN WATER MANAGEMENT POLICY OF THE UNITED STATES GOVERNMENT,
Water Resources Council, Washington, D.C.
W. D. Maughan.
In: Water Management--Basic Issues; Organization for Economic Cooperation and Development, Paris, France, p 47-55, 1972. 2 fig, 1 tab.

Descriptors: *Legislation, *Water Quality Act, *Water resources planning act, *Water Resources Research Act, *Water resources development, Planning, Water management (Applied), Water policy.
Identifiers: Environmental Impact Statements.

The existing development and use of the nation's water resources have evolved over a long period in a setting of abundant natural resources. This has been without benefit of broad planning frameworks to relate individual problems and their solutions to available resources and the regional needs. Comprehensive and coordinated planning among federal government, State and local

authorities, and private enterprise is essential if water needs of the future are to be met. The Water Resources Planning Bill was introduced into the Congress in 1961 and became an Act in 1965. The first title provides for establishment of the Water Resources Council and assigns to it responsibilities for formulating principles, standards, and procedures for use by all federal agencies, and for preparing, periodically, a national assessment of the nation's water resources. The second title of the Act provides for the establishment of river basin commissions. The third title of the Act sets up a federal grant program. The first National Assessment indicated that although the country's withdrawals of fresh and saline water will increase fivefold over the next 50 years, the consumptive use will only double. The Environmental Quality Act, which became effective on January 1, 1970, includes a requirement that all agencies of the federal government shall include in every recommendation or report on proposals for legislation and other major federal actions significantly affecting the quality of the human environment, a detailed statement by the responsible official on the environmental impact of the proposed action. THE ROLE OF THE UNITED STATES ARMY CORPS OF ENGINEERS IN WATER MANAGEMENT,
Corps of Engineers, Washington, D.C.
F. J. Clarke.
In: Water Management--Basic Issues; Organization for Economic Cooperation and Development, Paris, France, p 57-62, 1972. 2 photo.

Descriptors: *Water management (Applied), *Water resources development, *Flood control, *Navigation, Flood plains, River training, Comprehensive planning.
Identifiers: *U.S. Army Corps of Engineers.

The United States Army's Corps of Engineers is unique among military organizations in having a major civilian public works assignment. The Army Corps of Engineers is the principal agency working with harbors, waterways, and river basins. The oldest of these missions is the provision of harbors and shallow and deep draft navigation channels in inland and coastal waterways. Virtually all United States commercial harbors have required improvement to make them useful to modern shipping. The second major traditional function is flood control. Another of the programs is the protection or restoration of beaches and shores suffering from erosion, and the protection of coastal areas from flooding due to hurricanes and tides. To support their activities the Army Engineers carry out an extensive research program at a number of installations, the largest is the Waterways Experiment Station at Vicksburg, Mississippi, where most model studies were conducted. Finally, because they have an experienced decentralized field organization in close contact with the engineering and construction resources of the entire nation, they play a major role in recovery from disasters of all kinds. (See also W73-13916) (Knapp-USGS)
W73-13921

THE ROLE OF THE UNITED STATES BUREAU OF RECLAMATION IN WATER MANAGEMENT ACTIVITIES,
Bureau of Reclamation, Washington, D.C.
E. L. Armstrong.
In: Water Management--Basic Issues; Organization for Economic Cooperation and Development, Paris, France, p 63-68, 1972. 2 photo.

Descriptors: *Water resources development, *Planning, *Federal government, *Reclamation states, Federal Reclamation Law, Water reuse, Water storage, Water conservation, Comprehensive planning.
Identifiers: *Bureau of Reclamation.

The U.S. Bureau of Reclamation was created in 1902 to assist in opening up to settlement and economic growth, through development of water and related land resources, the area that now comprises the 17 western States. Through the development of irrigation with its accompanying community and regional economic growth, the reclamation program has assisted in the creation of the economic and social base that underlies the American West. Research in weather modification to augment natural water supplies has been underway since 1962. In addition to weather modification, desalinization, and undersea transport, the Bureau intends to look into opportunities for the use of geothermal steam, underground storage, recycling, renovation, reuse of water, and to explore means and methods of more efficiently utilizing available water supplies. PLANNING AND IMPLEMENTATION OF WATER AND RELATED LAND RESOURCE DEVELOPMENTS OF THE UNITED STATES DEPARTMENT OF AGRICULTURE,
Soil Conservation Service, Washington, D.C.
K. E. Grant.
In: Water Management--Basic Issues; Organization for Economic Cooperation and Development, Paris, France, p 69-74, 1972. 1 photo.

Descriptors: *Water resources development, *Land management, Watershed management, Planning, Conservation, Erosion control, Farms, Farm management, Comprehensive planning.
Identifiers: *Department of Agriculture.

The United States Department of Agriculture is concerned with comprehensive planning for the development of water and related land resources. Comprehensive river basin planning activities are conducted by the Soil Conservation Service, the Forest Service, and the Economic Research Service. In most river basins, especially those in the eastern two-thirds of the United States, 80% or more of the land is in agricultural use, including timber production. With much of the land used for agricultural purposes agriculture has a significant influence on river basin planning and management. The primary aims of the Soil Conservation Service are: to control soil erosion and reduce sediment pollution through proper land use by measures protecting soil and managing runoff water on farms and other lands; to protect land resources to assure their sustained productivity of agricultural commodities; to reduce floodwater and sediment damage to agricultural crops, pasture, livestock, and farm improvements, to roads and bridges, and to urban, residential, and industrial investments in upstream flood plains; to provide adequate water management on farmlands to permit production on bottom, crop, and pasture lands; to provide water supply for rural commodities in upstream areas for municipal and industrial uses, irrigation, water-based recreation, fish and wildlife enhancement, and water-quality management; to guide local communities in water-resource developments that will contribute to community development and stimulate economic growth; and to protect and enhance the environment through all conservation activities. W73-13923

CANADIAN WATER POLICY: HISTORY, PROBLEMS AND RECENT DEVELOPMENTS,
Department of Energy, Mines and Resources, Ottawa (Ontario).
J. Austin.
In: Water Management--Basic Issues; Organization for Economic Cooperation and Development, Paris, France, p 77-84, 1972.

Descriptors: *Canada, *Planning, *Water management (Applied), Great Lakes, International Joint Commission, St. Lawrence River, Water pollution control, Political aspects, Comprehensive planning.

The Canada Water Act embodies concepts of an integrated approach to water management. The Act was developed also within the Canadian system of shared jurisdiction between federal and provincial governments. In Canada the actual ownership of the water resources is generally agreed to belong to the provinces. The federal government, however, has specific and major responsibilities for navigation and fisheries, and joint responsibility with the provinces for agricultural uses of water. The federal government also has general responsibilities arising from the fact that lakes and rivers often straddle interprovincial and international boundaries. With the passage of this Act, the federal government will be able, for the first time, in close cooperation with the provinces, to take initiatives to develop a comprehensive approach to water management. The growing complexity of water problems arising from new technology and rapidly increasing water use requires continuing and increasingly effective forms of international cooperation on a broad basis, for the exchange of experience or research information, for consultation, and for joint efforts to find solutions to common problems. W73-13924

CANADIAN FEDERAL WATER RESOURCE POLICY,
Department of Energy, Mines and Resources, Ottawa (Ontario).
E. R. Tinney, and R. J. Van Loon.
In: Water Management--Basic Issues; Organization for Economic Cooperation and Development, Paris, France, p 85-97, 1972. 1 fig.

Descriptors: *Canada, *Water law, *Water resources development, Legislation, Water management (Applied), Water pollution control, Political aspects.

The Canada Water Act, passed by the Canadian Parliament on June 26, 1970, is an attempt to apply the most modern principles possible to water resource management in the Candian setting. In situations where the problems of pollution are paramount and urgent, the Act has special provisions for the establishment of water quality management agencies whose job it will be to control and manage all aspects of water quality in a river basin. There are four distinct kinds of institutional bodies being set up to achieve joint federal-provincial cooperation. These are consultative committees, joint planning boards with the subordinate committees, joint water quality management agencies, and joint implementation boards. (See also W73-13916) (Knapp-USGS)

PLANNING FOR THE PACIFIC NORTHWEST,
Pacific Northwest River Basins Commission, Vancouver, Wash.
D. J. Lane.
In: Water Management--Basic Issues; Organization for Economic Cooperation and Development, Paris, France, p 101-108, 1972.

Descriptors: *Water resources development, *Planning, *Interstate commissions, Water management (Applied), River basin commissions, Comprehensive planning, River basin development.
Identifiers: *Pacific Northwest River Basins Commission.

The Pacific Northwest River Basins Commission has 15 members; one representative from each of the five member States; a representative of each of the following seven federal cabinet departments: Agriculture, Army, Commerce, Health, Education and Welfare, Housing and Urban Development, Interior, and Transportation; a representative of the Federal Power Commission; a representative of the United States-Columbia River Treaty; and a federal chairman appointed by

and serving at the pleasure of the President of the United States. The commission writes rules, approves plans of study, develops joint funding programs and monitors the progress of comprehensive water and related land planning programs within its jurisdiction. The members of the Commission represent every well-defined water interest, thus assuring a proper and vigorous presentation of each possibility for use or preservation of importance. The decision making process for the Commission is an integration of mathematics, technology, and well-informed judgment. (See also W73-13916) (Knapp-USGS)

Descriptors: *Tennessee Valley Authority, *Water resources development, Social aspects, Transportation, Water management (Applied), River basin development.

While the major components of TVA's regionwide river control system have been completed, smaller scale additions will be required for many years to come. They will be necessary in order to assure the continued growth of the economy; the TVA is convinced that it can be done without harming the environment. As a means of encouraging heavy industry which will require higher skills and pay higher wages, TVA now plans to create additional transport complexes. It does this sometimes by extending navigation by dam construction or dredging, sometimes by extending rail service to the waterway. Both the economic benefits from this type of development and also the very important social consequences must be emphasized. The creation and use of these complexes and their surrounding sites will have a tendency to disperse the industrial establishment of the region and thus diminish the social pressures which arise in congested urban areas. W73-13927

PLANNING IN THE NEW ENGLAND REGION,
New England River Basins Commission, Boston, Mass.
R. F. Gregg.

Descriptors: Planning, *Water resources development, *New England, New England Interstate WPS Compact, Water management (Applied), Interstate commissions, River basin development, River basin commissions, Comprehensive planning.

Effective management of water and related land resources of New England requires simultaneous and coordinated federal-state planning for both hydrographic and political regions, with particular reference to the development of statewide water and related land plans which serve as guides to federal as well as state management activities. The NERBC has an approach to planning which calls for the early completion for the entire region and appropriate sub areas of a comprehensive, coordinated joint plan setting forth coordinated action programs for a mid-range period of about 10-15 years. The New England framework study is adapted from the North Atlantic Regional Water Resources Study, to be completed in fiscal year 1971 under leadership of the North Atlantic Division United States Army Corps of Engineers. Reconnaissance-level water and related land management plans for each of the New England states are to be jointly formulated by teams of state, federal, and NERBC professionals under State leadership. The plans will recommend specific steps which should be taken during the next 10-15 years to conserve, protect, and develop water and related land resources of the State. Management plans are used for selected sub-regions of unusual complexity or conflict. A comprehensive plan for the Connecticut River basin, the region's largest, is virtually completed. A federal-state management plan for the southeastern New England area (covering the Massachusetts coastal area and rivers, and almost all of Rhode Island) will begin July 1, 1970. It is scheduled to be completed in fiscal year 1974. The proposed program recommends a third intensive sub-regional study, a reconnaissance-level plan for Long Island Sound, to be organized as a joint effort of the States of Connecticut and New York, federal agencies, and local governments. NORTH ATLANTIC REGIONAL WATER RESOURCES STUDY,
Corps of Engineers, Washington, D.C.
H. E. Schwarz.
In: Water Management--Basic Issues; Organization for Economic Cooperation and Development, Paris, France, p 135-145, 1972. 3 fig.

Descriptors: *Planning, *Water resources development, *Northeast U.S., Water management (Applied), River basin development, Interstate commissions, River basin commissions, Comprehensive planning.
Identifiers: *North Atlantic Regional Water Resources Study.

Population growth and accelerated economic development are placing increasing demands on the water and related land resources of the United States. Efforts to establish machinery for coordination of diverse interests represented by a large number of federal, state, and local agencies culminated in the Water Resources Planning Act of 1965 which established the Water Resources Council. It is under the guidelines of this body that the North Atlantic Regional Water Resources Study is conducted. The NAR study is directed towards planning for the optimum development of water and related land resources over a planning period extending to year 2020, with intermediate bench-mark years set at 1980 and 2000. It is a 'framework' type of study intended to provide an overview of regional and subregional needs, an assessment of supply and demand, and should serve as a guide for future developments in the region. The study will illuminate the choices that are available to the decisionmaker and lay before him facts and opinions to aid him in his judgement. The NAR study concentrates on the broad regional aspects of water resources, and as such, the planning effort was viewed as a partnership among federal agencies, States, and regional basin commissions. (See also W73-13916) (Knapp-USGS)
W73-13929

SOME EXPERIENCES OF THE ONTARIO WATER RESOURCES COMMISSION,
Ontario Water Resources Commission, Ottawa.
D. J. Collins.
In: Water Management--Basic Issues, Organization for Economic Cooperation and Development, Paris, France, p 147-161, 1972. 2 fig.

Descriptors: *Canada, *Planning, *Water resources development, *Water pollution control, River basin development, Water management (Applied), Comprehensive planning.
Identifiers: *Ontario Water Resources Commission.

Experiences of the Ontario Water Resources Commission related to water resources surveys and to providing water and sewage works or services for municipalities are described. The authority for the Commission and its programs is The Ontario Water Resources Commission Act, as enacted in 1957 and appropriately amended. Regulations made under the Act are used to control such diverse activities as the drilling of water wells, the use of aquatic herbicides and plumbing. Water rights in the province are based on English common law with some supplementary legislative requirements governing takings of water. (See also W73-13916) (Knapp-USGS)
W73-13930

WATER RESOURCE PLANNING FOR THE SUSQUEHANNA RIVER BASIN,
Army Engineer District, Baltimore, Md
W. J. Love, and A. E. Robinson, Jr.
In: Water Management--Basic Issues, Organization for Economic Cooperation and Development, Paris, France, p 163-175, 1972.

Descriptors: *Planning, *River basin development, *Water resources development, Water management (Applied), Chesapeake Bay, Social aspects, River basin commissions, Interstate commissions, Comprehensive planning.
Identifiers: *Susquehanna River Basin.

The Susquehanna River basin is the largest on the Atlantic Seaboard of the United States, having a drainage area of approximately 27,500 sq mi. It traverses many ecological and economic settings in three states, New York, Pennsylvania, and Maryland. In 1963 the Congress of the United States requested a comprehensive study of the water and related land resources of the basin. The task of preparing the report and coordinating the study was assigned to the Baltimore District, U. S. Army Corps of Engineers. Before the Susquehanna River basin (SRB) study began, it was realized that a meaningful study must fully consider all aspects of water resource development, and that it would be necessary to ascertain the viewpoints of all interested persons. It was therefore necessary to develop methods to do this and one of the first steps taken was to form a coordinating committee. Representation of 7 federal agencies and 3 states on the committee insured that a multitude of viewpoints would be reflected in any decisions made. Through the information program, where possible, the views of the general public have been incorporated into the plan. With this information program the coordinating committee has formulated a plan for the conservation and development of the basin's resources which, hopefully, will meet the needs of the developing basin, preserve and enhance its environment, and be acceptable to the public. (See also W73-13916) (Knapp-USGS)
W73-13931

THE WORK OF THE DELAWARE RIVER BASIN COMMISSION,
Delaware River Basin Commission, Trenton, N.J.
P. M. VanWegen.
In: Water Management--Basic Issues; Organization for Economic Cooperation and Development, Paris, France, p 177-188, 1972.

Descriptors: *Delaware River Basin Commission, *Planning, *Water resources development, *Water management (Applied), Delaware River, Regulation, Interstate commissions, River basin commissions, Comprehensive planning.

The Delaware River Commission is an institutional arrangement by which four States--New York, New Jersey, Delaware and Pennsylvania--and the United States Government act together to carry out responsibility for planning and managing water and related resources development in the Delaware River Basin. It is the only full partnership federal-inter-state organization in the United States vested with comprehensive planning and management responsibilities, and with full enforcement powers to insure program implementation. The Commission was established in 1961 after a long history of multi-State water supply

lisputes dating back to the 1920's, and a chronic need to provide adequate flood protection within the basin. (See also W73-13916) (Knapp-USGS)
W73-13932

A WATER SUPPLY STUDY OF THE SASKATCHEWAN-NELSON BASIN,
Saskatchewan-Nelson Basin Board, Regina.
E. F. Durrant, and G. C. Mitchell.
In: Water Management--Basic Issues Organization for Economic Cooperation and Development, Paris, France, p 189-202, 1972. 5 fig.

Descriptors: *Planning, *River basin commissions, *Canada, River basin development, Water management (Applied), Water supply, Political aspects, Administration, Comprehensive planning.
Identifiers: Sadkatchewan-Nelson basin.

On October 16, 1967, the government of Canada and the governments of Canada's three prairie provices (Alberta, Saskatchewan, and Manitoba) signed an agreement to undertake a 4-year, 5-million dollar study of the water resources of the Saskatchewan-Nelson basin including the potential additional supply by diversion or storage. This limited-purpose study represents a logical step in the evolution of interjurisdictional arrangements for integrated water resource management. The primary concentration of this study is on the Saskatchewan-Nelson as a hydrologic unit with contiguous river systems to the north being considered mainly as potential sources of additional supply. The Saskatchewan-Nelson basin is very large and complex--hydrologically, economically, and politically. The basin comprises 414,000 square miles from snowcapped mountains rising above 10,000 feet, across the agricultural prairie sloping from 3,000 to 800 feet through the bedrock and tundra of the Canadian Shield down to Hudson Bay. The climatic environment ranges from subhumid to semiarid. The basin covers portions of 4 provinces in Canada and 4 States in the United States. (See also W73-13916) (Knapp-USGS)
W73-13933

WATER RESOURCES PLANNING IN THE OKANAGAN BASIN,
Department of Energy, Mines and Resources, Ottawa (Ontario). Policy and Planning Branch.
R. C. Hodges, H. M. Hill, and R. Koop.
In: Water Management--Basic Issues Organization for Economic Cooperation and Development, Paris, France, p 203-215, 1972. 2 fig.

Descriptors: *Planning, *River basin commissions, *Canada, River basin development, Water management (Applied), Water supply, Water pollution control, Political aspects, Administration, Comprehensive planning.
Identifiers: *Okanagan basin.

In the Okanagan basin in British Columbia, Canada, an intergovernmental agreement was negotiated for the purpose of carrying out a comprehensive water resources planning program. A comprehensive planning approach to the entire Okanagan region of British Columbia is a logical step to the solution of existing problems. Such a comprehensive approach to the Okanagan basin offers an opportunity for multidisciplinary, multidimensional planning, based on studies of economic growth, water quality and quantity, management alternatives, ecology and aesthetics and public involvement. Such a comprehensive approach not only allows for the solution of existing problems, but also permits establishment of a framework plan to deal with future water resource management problems in the Okanagan. (See also W73-13916) (Knapp-USGS)
W73-13934

NEW CONCEPTS FOR MANAGING THE GREAT LAKES WATER RESOURCES,
Ohio Dept. of Natural Resources, Columbus.
F. E. Morr.
In: Water Management--Basic Issues; Organization for Economic Cooperation and Development, Paris, France, p 217-223, 1972. 1 fig.

Descriptors: *Great Lakes, *Interstate commissions, Planning, Political aspects, Comprehensive planning, Administration, Water resources development, Water supply, Water pollution control, Systems analysis, Model studies, Optimization.
Identifiers: *Great Lakes Basin Commission.

Public demand for abatement of pollution in the Great Lakes caused new legislation to be introduced to implement new research, regulations, and management programs. New legislation will require changes in methods of disposing of dredging spoils from the Great Lakes harbors so that they will not further contribute to pollution of the Great Lakes. New emphasis is being placed on the effects of thermal pollution, erosion and silt, and lake level fluctuations. A great problem is the dilemma created by the increased demand for electric power, causing a concurrent decline in water resources quality. (See also W73-13916) (Knapp-USGS)
W73-13935

A DISCUSSION OF PLANNING PROCEDURE IN TERMS OF THE OECD NINE BASIC WATER MANAGEMENT PROBLEMS,
Great Lakes Basin Commission, Ann Arbor, Mich.
L. T. Crook.
In: Water Management--Basic Issues; Organizational for Economic Cooperation and Development, Paris, France, p 225-237, 1972.

Descriptors: *Comprehensive planning, *Great Lakes Region, River basin planning, Water management (Applied), Political aspects, Administration, Interstate commissions.
Identifiers: *Great Lakes Basin Commission.

The OECD basic water management problems are discussed in light of techniques for comprehensive planning used in the Great Lakes and techniques and procedures developed by the Great Lakes Basin Commission. The nine OECD problems are: (1) criteria for planning; (2) objectives; (3) procedures for choice among alternatives; (4) divided jurisdictions; (5) divided administrative responsibilities; (6) special interest groups; (7) how to obtain agreement; (8) information services; and (9) apportionment of costs. (See also W73-13916) (Knapp-USGS)
W73-13936

COMPREHENSIVE PLANNING FOR THE GREAT LAKES,
Great Lakes Basin Commission, Ann Arbor, Mich.
L. T. Crook.
In: Water Management--Basic Issues; Organization for Economic Cooperation and Development, Paris, France, p 239-249, 1972.

Descriptors: *Great Lakes, *Interstate commissions, Planning, Political aspects, Comprehensive planning, Administration, Water resources development, Water supply, Water pollution control, Systems analysis, Model studies, Optimization.
Identifiers: *Great Lakes Basin Commission.

The technical activities of the Great Lakes Basin Commission are: (1) to serve as the principal agency for coordination of all plans for development of water and related land resources in the basin; (2) to prepare and keep up to date a comprehensive, coordinated plan for development of water and related resources (including all reasonable alternatives); (3) recommend long-range schedules of priorities for all phases of development, including the collection and analysis of basic data, for investigation, planning, and the construction of projects; and (4) foster and undertake such special studies of water and related land resources problems as are necessary for the preparation of the comprehensive plan. The coordination of plans under the Great Lakes Basin Commission does not establish another hierarchy or level of planning within the basin. No actual planning will be undertaken by the Commission staff unless capacity or initiative for such planning is not demonstrated among the existing organizations and institutions within the basin. By combined support, the total effective planning effort of federal, state, and other governmental organizations will be considerably magnified. (See also W73-13916) (Knapp-USGS)
W73-13937

INSTITUTIONAL ARRANGEMENTS FOR THE GREAT LAKES BASIN,
Pennsylvania Dept. of Forests and Waters, Harrisburg.
C. H. McConnell.
In: Water Management-Basic Issues; Organization for Economic Cooperation and Development, Paris, France, p 251-259, 1972.

Descriptors: *Water management (Applied), *Comprehensive planning, *Great Lakes region, *Jurisdiction, Legal aspects, Political aspects, State jurisdiction, Institutions, Administration, Administrative agencies, International Joint Commission.

Problems of divided jurisdiction in the Great Lakes basin and the types of institutions that can be used to solve the water and related land resources problems of the basin are discussed. As a result of the Boundary Water Treaty of 1909 the International Joint Commission (IJC) was established. The 1909 treaty gives the Commission responsibility in the following: to approve or refuse approval of all proposals for use, obstruction or diversion of the boundary waters on either side of the international boundary; and to investigate and make recommendations on problems along the frontier. An interstate compact also exists in the Great Lakes basin. The enabling legislation for the Great Lakes Commission provides that the purposes of the Compact are to: (1) promote the orderly, integrated and comprehensive development, use, and conservation of the water resources; (2) plan for the welfare and development of the water resources of the basin as a whole; (3) make it possible for the States of the basin and their people to derive the maximum benefits from utilization of public works; (4) advise in securing and maintaining a proper balance among industrial, commercial, agricultural, water supply, residential, recreational and other legitimate uses; and (5) establish and maintain an intergovernmental agency. W73-13938

RESEARCH IN SUPPORT OF PLANNING AND MANAGEMENT OF WATER AND RELATED LAND RESOURCES,
Federal Council for Science and Technology, Washington, D.C.
W. A. Hall.
In: Water Management--Basic Issues; Organization for Economic Cooperation and Development, Paris, France, p 263-270, 1972.

Descriptors: *Research and development, *Water management (Applied), *Water resources development, Abstracts, Publication, Planning, Comprehensive planning.
Identifiers: Water Resources Scientific Information Center.

Research programs must be made compatible with the planning and management processes. There are four problems to be solved in dealing with this

question: (1) why research is necessary for effective water management; (2) how to make research programs compatible with management and at the same time maintain a broad objective perspective; (3) how to coordinate research in a multiagency, multigovernmental system; and (4) how to display results to get them used. The U. S. Office of Water Resources Research maintains a Water Resources Scientific Information Center. This Center provides scientific information from published reports in the form of abstracts. A semimonthly abstract bulletin is now being sent to professional persons in the field of water resources in the United States. It is also available, on request, for foreign subscription. W73-13939

RESEARCH ACTIVITIES NEEDED FOR PLANNING AND MANAGEMENT IN THE GREAT LAKES,
Army Engineer Div. North Central , Chicago, Ill.
W. W. Watkin, Jr.
In: Water Management--Basic Issues; Organization for Economic Cooperation and Development, Paris, France, p 271-275, 1972.

Descriptors: *Research and development, *Water management (Applied), *Great Lakes region, Universities, Federal Government, Canada, United States, International Joint Commission, Interstate commissions, Planning, Comprehensive planning.
Identifiers: U. S. Army Corps of Engineers.

Great Lakes problems requiring research for their solution are identified. Examples are given of problems, the results of research, and how the results are related to decisionmaking. The examples given are primarily in terms of U. S. Army Corps of Engineers activities on behalf of the United States Government. Corps of Engineers reports are designed to provide descriptions of physical features pertinent to the proposed action; desires of those concerned; coordination with other agencies; special problems; alternative solutions; benefits; and costs. Since 1953 conferences on the Great Lakes have been held for formal interchange of knowledge in the fields of hydrology, meteorology, limnology, and fisheries. These are under the auspices of the International Association for Great Lakes Research. A Canada-United States organization called the International Great Lakes Study Group consists of representatives of federal and State agencies and universities. This group facilitates the exchange of information and provides informal coordination among the various research activities. It sponsors a data repository for the cataloging, storage, and circulation of basic data. The Committee on Institutional Cooperation was established in 1958 by the presidents of the 11 major universities in the Great Lakes region of the U.S. (See also W73-13916) (Knapp-USGS)
W73-13940

THE INTERNATIONAL FIELD YEAR FOR THE GREAT LAKES: AN INTERNATIONAL, INTERAGENCY AND INTERDISCIPLINARY APPROACH TO A RESEARCH PROGRAMME IN WATER RESOURCES,
Meteorological Service of Canada, Ottawa (Ontario).
T. L. Richards, and W. J. Drescher.
In: Water Management--Basic Issues; Organization for Economic Cooperation and Development, Paris, France, p 277-286, 1972.

Descriptors: *Research and development, *Great Lakes region, *International commissions, *International Hydrological Decade, Comprehensive planning, Water management (Applied), Water resources development, Administration, Political aspects.
Identifiers: *International Field Year for the Great Lakes.

The International Field Year for the Great Lakes (IFYGL) was organized and designed to undertake an international and interdisciplinary research program. Its research was developed internationally under the Canadian and United States National Committees for the International Hydrogical Decade. Three problems are of concern in the IFYGL study; divided jurisdiction, divided administrative responsibility, and integrating information services. Problems associated with divided jurisdiction have been few and relatively minor. To date, only two have required referral to diplomatic channels. In both cases, (1) surveillance flights over foreign land areas, and (2) the movement of an army research team across an international border, immediate and sympathetic attention is being received. Individual agencies on each side of the border assumed responsibilities for specific facilities and at present, agencies and universities are committing themselves to specific research programs under contract. Where programs are identical or overlap, the organizations will work together as coordinated task forces. As a result, problems of divided administrative responsibilities have not appeared. (See also W73-13916) (Knapp-USGS)
W73-13941

THE CANADA CENTRE FOR INLAND WATERS: AN APPROACH TO RESEARCH CO-ORDINATION,
Department of Energy, Mines and Resources, Ottawa (Ontario). Inland Waters Branch.
A. T. Prince, and J. P. Bruce.
In: Water Management--Basic Issues; Organization for Economic Cooperation and Development, Paris, France, p 287-300, 1972.

Descriptors: *Comprehensive planning, *Research and development, *Canada, *Water management (Applied), Water resources development, International commissions, Federal Government, Administration.
Identifiers: *Canada Centre for Inland Waters.

Responsibility for water resource management in Canada is divided between federal, provincial, and municipal levels of government. While ownership of the resource rests with the provinces, the federal government has responsibilities in connection with navigation, fisheries, and international waters. In the conduct and support of research which will benefit all parts of Canada, the major role should be played by the federal government. From the inception of the Canada Centre for Inland Waters, the main program has been in the fields of pollution abatement and water quality, all aspects of limnology, hydraulics problems peculiar to Canada, and socioeconomic studies related to these fields. The support facilities of the Centre, including ships, machine shops, computer facilities, library, etc., were planned specially to serve university needs as well as the other activities of the Centre. The broad objectives of the federal government in establishing the CCIW were the restoration and protection of the environment in regions where heavy pressures are being exerted on the water resource, and the protection and enhancement of national income in the Great Lakes area, Canada's most productive region. These objectives were to be achieved through improved management of water resources and the maintenance of good water quality standards. (See also W73-13916) (Knapp-USGS)
W73-13942

THE ROLE OF THE INTERNATIONAL JOINT COMMISSION,
International Joint Commission-United States and Canada.
E. W. Weber.
In: Water Management--Basic Issues; Organization for Economic Cooperation and Development, Paris, France, p 303-309, 1972. 4 ref.

Descriptors: *International Joint Commission, *International waters, International Commissions, Canada, United States, Water management (Applied), Administration, Comprehensive planning.

The purpose of the Boundary Waters Treaty of 1909 was to prevent disputes regarding the use of boundary waters and to settle all questions between the United States and the Dominion of Canada involving the rights, obligations, or interests of either. To accomplish the purpose and to carry out the specific provisions of the Treaty, the two countries agreed to establish and maintain an International Joint Commission composed of six commissioners, three appointed by the President of the United States and three by the Government of Canada. Briefly the responsibilities of the Commission are of three general types: (1) a power delegated by the two countries to approve or disapprove proposals for uses that would affect the levels or flows or boundary waters (i.e. waters forming the boundary) and waters crossing the boundary under certain conditions, (2) a duty to investigate, report, and make recommendations to the two countries on any question referred to it by either government, and (3) a power to decide on any question which the two governments agree, through official governmental actions, to refer to the Commission for consideration and decision. CANADIAN-UNITED STATES DEVELOPMENT OF THE COLUMBIA RIVER AS RELATED TO ARRANGEMENTS FOR POWER DEVELOPMENT IN THE U. S. PACIFIC NORTHWEST,
Pacific Power and Light Co., Richland, Wash.
G. L. Beard.
In: Water Management--Basic Issues; Organization for Economic Cooperation and Development, Paris, France, p 311-324, 1972. 1 photo.

Descriptors: *Columbia River, *International waters, *International commissions, *Water resources development, International Joint Commission, Water management (Applied), Hydroelectric power, Comprehensive planning.
Identifiers: *Columbia River Treaty.

The Columbia River basin is a relatively uncomplicated example of a large and important hydrographic basin which straddles an international boundary. The basin's main river, the Columbia, has its headwaters in Canada and its terminus in the United States. Electric power is an important factor in selecting the choice of approach to water management in a basin and the cost apportionment arrangements developed. The Columbia River Treaty was signed on January 17, 1961. The Treaty provides that Canada will build three large storage projects on her side of the border and the United States is permitted to build Libby Dam which will back water into Canada. Notwithstanding the location of the Columbia River basin within each of two sovereign countries, unified development of its water resources is now being achieved. (See also W73-13916) (Knapp-USGS)

THE REGIONAL DEVELOPMENT APPROACH FOR MANAGING WATER IN SPAIN,
Consejo Superior di Investigaciones Cientificas, Madrid (Spain). Instituto de Hidrologia.
J. M. M. Mendiluce.
In: Water Management--Basic Issues; Organization for Economic Cooperation and Development, Paris, France, p 335-336, 1972.

Descriptors: *Water resources development, *Comprehensive planning, *Water management (Applied), *Regional development, Planning, Water transfer, Inter-basin transfers, Administration.
Identifiers: *Spain.

Spain, with its very old traditions and experience with water on a hydrologic basis, has recently shifted its approach to water management by focusing on regional and economic developments as a more practical approach for achieving objectives. In the past, Spain was oriented around the hydrographic approach to water management. This approach was satisfactory when the water demands in a basin did not exceed the supply in that basin, but today, it is necessary to consider larger areas than hydrographic units, as planners and developers have become aware of the need to approach water problems from viewpoints more comprehensive than a river basin alone. OBJECTIVES OF WATER MANAGEMENT IN GERMANY,
Bundesministerium des Innern, Bonn (West Germany).
H. Muhleck.
In: Water Management--Basic Issues; Organization for Economic Cooperation and Development, Paris, France, p 339-342, 1972.

Descriptors: *Water management (Applied), *Governments, Water law, Comprehensive planning, Regional development, Regional economics, Administration.
Identifiers: *Germany.

In the Federal Republic of Germany, water management is defined as the purposive adjustment of all human influences on surface and underground waters. Water management planning and programs are accordingly oriented towards the requirements of the total national economy and its objectives. Specific governmental programs concern equalization of regional differences of economic resources, improvement of the agricultural structure, and promotion of relatively small enterprises. In industrial centers, water associations have, in many cases, been set up to carry out the water management of larger river areas according to uniform conditions. The tasks of the associations also include wastewater treatment for which collective purification plants are being constructed on a large scale. (See also W73-13916) (Knapp-USGS)

THE ITALIAN PROGRAMME OF THE 'CASSA PER IL MEZZOGIORNO' AS AN ILLUSTRATION OF MEANS TO ACHIEVE ECONOMIC DEVELOPMENT OBJECTIVES,
Bureau of Scientific Research and Water Coordination Use of 'Cassa per Il Mezzoriorono', Rome (Italy).
R. Passino.

Descriptors: *Water resources development, *Regional development, Water law, Comprehensive planning, Legal aspects, Administration, Regional economics, Governments.
Identifiers: *Italy.

Because water resources have played an important role in the economic development of the Italian regions, the Italian State, since the country was unified in 1860, has promoted technical and administrative bodies responsible both for public and private use of water. Among its technical services, the unified State instituted the Italian Hydrographic Service, operating with the aid of many other technical and scientific bodies, and laid the foundation for an appropriate system of laws aimed at regulating the development and utilization of water resources. Ultimately a comprehensive Water Act was promulgated, on December 11, 1933. All Italian waterworks, some of them of exceptional importance, have been carried out and managed in the framework of this legislation, which recognizes water as belonging to the community, and places special emphasis on the concept of concession for the use of water, to be granted to the users. In order to achieve these objectives, the 'Cassa per il Mezzogiorno', a public authority with large financial and administrative independence, was instituted in 1950, with the responsibility of a long-term development program. The characteristic of the special action taken by the Italian Government through the 'Cassa per il Mezzogiorno' is an organically planned long-term multisector program. Water supply for many different purposes has been, in this frame, the most important sector of interest. (See also W73-13916) (Knapp-USGS)

OBJECTIVES OF WATER MANAGEMENT IN JAPAN,
Ministry of Construction, Tokyo (Japan). River Bureau.
R. Higano.
In: Water Management--Basic Issues; Organization for Economic Cooperation and Development, Paris, France, p 351-354, 1972.

Descriptors: *Water resources development, *Regional development, Water law, Comprehensive planning, Legal aspects, Administration, Regional economics, Governments.
Identifiers: *Japan.

Water management objectives, as stated in the Japanese River Law, are: to contribute to the land conservation and development of the country and thereby to maintain public security and promote public welfare, by administering rivers comprehensively to prevent occurrence of damage due to floods, high tides, etc., utilize rivers properly, and maintain the normal functions of the river water. In water resources development, the objectives of the Resources Development Promotion Law are: the promotion of the comprehensive development and the rational utilization of the water resources in the whole water system of rivers, together with the conservation and protection of the headwaters, in order to secure the supply of water for areas which need water owing to the industrial development or growth and the increase in the urban population, and thereby to contribute to the growth of the national economy and the improvement of the people's living. PROCEDURES USED IN JAPAN FOR CHOOSING AMONG WATER MANAGEMENT ALTERNATIVES,
Ministry of Construction, Tokyo (Japan). River Bureau.
R. Higano.
In: Water Management--Basic Issues; Organization for Economic Cooperation and Development, Paris, France, p 357-360, 1972.

Descriptors: *Water resources development, *Regional development, Water law, Comprehensive planning, Legal aspects, Administration, Regional economics, Governments.
Identifiers: *Japan.

In Japan, class A rivers are administered by the State and class B rivers by prefectures, in accordance with the provisions of the River Law. In designating a river as a class A river, the opionions of the River Council and of the prefectural governors concerned are heard. The governors present their opinions following the decision of the general assemblies of the respective prefectures. A river adminstrator fixes a basic plan of work for each water system he administers to ensure comprehensive administration of rivers by taking into consideration the conditions of flood damage caused in the past, present status of utilization of water resources and their development, and also by effecting coordination with the comprehensive national land development plan. In order to protect public health from adverse effects of heavy metals such as organic mercury and cadmium, and various other kinds of contaminating substances, uniform standards of allowable limits are to be established for all waters. W73-13949

A TECHNICAL SOLUTION TO THE PROBLEM OF DIVIDED JURISDICTION OF WATER RESOURCE DEVELOPMENT IN SPAIN AND PORTUGAL,
Consejo Superior di Investigaciones Cientificas, Madrid (Spain). Instituto de Hidrologia.
J. M. M. Mendiluce.
In: Water Management--Basic Issues; Organization for Economic Cooperation and Development, Paris, France, p 375-376, 1972.

Descriptors: *International waters, *Administration, *International commissions, International law, Treaties, Political aspects, Comprehensive planning, Hydroelectric power, Dams, Regulation.
Identifiers: *Spain, *Portugal.

Spain and Portugal have developed a technical solution to overcome the problem of divided jurisdiction in water management for waters of joint interest. This solution has been developed in connection with the control of water, principally for electric power production, although water supply and irrigation have been considered in the development of the solution. The solution depended on accurate knowledge of the regulation of water flow. An international agreement for this purpose was ratified by both countries in 1969. The agreement considers all the potential energy which may be produced in the river basins in which there is mutual international interest. Three major river basins are in both countries: Mino. Tajo, and Guadiana. A joint report was prepared in which an evaluation showed that the electric power potential of the Guadiana basin should go to Portugal; the electrical power potential of the Tajo basin should go to Spain, and the Mino could be used to adjust differences in kWh between the two countries. THE LICENCE SYSTEM OF THE SWEDISH ENVIRONMENT PROTECTION ACT AS A MEANS TO OVERCOME DIVIDED ADMINISTRATIVE RESPONSIBILITIES,
National Swedish Environment Protection Board, Stockholm.
L. Hannerz.
In: Water Management-Basic Issues; Organization for Economic Cooperation and Development, Paris, France, p 395-399, 1972.

Descriptors: *Water management (Applied), *Water law, *Regulation, *Water pollution control, *Water resources development, Political aspects, Administration, Planning, Comprehensive planning, Environment, Public health, Ecology.
Identifiers: *Sweden.

The main public interest in the utilization of water resources in Sweden includes water supply, recreation, hydroelectric power generation, fishery, and general nature conservancy aspects. To this is added the needs of industry and municipalities to discharge wastes into water. Conflicting interests with respect to alternative uses of water resources are balanced by legislative means. Since July 1969 Sweden has had a new law in force relating to the protection against a wider variety of activities which may threaten the environment. This law, the Environment Protection Act, regulates the problems of water pollution, air pollution, noise and other disturbances arising from land-based activities. Water management in Sweden today is characterized by the central position in the licensing procedures by the Environment Pro-

tection Board, and by the good relations between the Board, industry, and the local government committees. So far, however, long-term plans for the use of the water resources have been worked out only for a few small regions and a nationwide plan for water management has only been informally discussed. (See also W73-13916) (Knapp-USGS)
W73-13951

ENVIRONMENTAL PROTECTION THROUGH APPLICATION OF THE NORWEGIAN WATER LAW,
Norsk Institutt for Vannforskning, Blindern.
K. Baalsrud.
In: Water Management-Basic Issues; Organization for Economic Cooperation and Development, Paris, France, p 403-405, 1972.

Descriptors: *Water management (Applied), *Water law, *Regulation, *Water resources development, *Water pollution control, Political aspects, Administration, Planning, Comprehensive planning, Environment, Public health, Ecology.
Identifiers: *Norway.

In water resources development special interest groups are often at a great disadvantage when matched against large and well organized groups such as industrial establishments. Arrangements to protect these interests in Norway date from 1941. The basis for these administrative measures is the Water Resources Act of 1940. Norway's arrangement is built around a review of permits for waste discharges by the Norwegian Water Resources and Electricity Board, a directorate in the Ministry of Industry. When the Board receives an application for a permit, it publishes the request in the newspapers. Any person or group interested in commenting or objecting to the permit is invited to do so. When satisfied with the understanding of the situation, the Board proposes to the Ministry of Industry that the permit should be approved, and designates the conditions under which it must be carried out. The Board may alter or impose higher conditions than were included in the initial application. If the applicant objects to the conditions, he can appeal to the King for reconsideration of the case. Although a discharger may have all legal rights through a permit for discharge, he is still fully responsible for any damage, inconveniences, or adverse effects to which the discharge may give rise. (See also W73-13916) (Knapp-USGS)
W73-13952

FINNISH WATERCOURTS: AN EXAMPLE OF A COMPENSATION PROCEDURE IN THE LOKKA ARTIFICIAL LAKE PROJECT,
Sunnittelukeskus-MKR, Helsinki (Finland).
O. Perakyla.
In: Water Management--Basic Issues; Organization for Economic Cooperation and Development, Paris, France, p 409-413, 1972. 1 fig.

Descriptors: *Water law, *Administration, *Adjudication procedure, *Water resources development, Legal aspects, Water rights, Appropriation, Compensation, Equitable apportionment, Legal review, Water policy, Comprehensive planning.
Identifiers: *Finland.

The water law of Finland provides various possibilities to implement water development programs. The law also prescribes procedures to compensate those affected adversely by damage and inconvenience which may result from such developments. Prior to 1961, permission to develop water management projects was granted by a water commission. Since then a new water law has established three water courts which are equivalent to the former commission and are composed of a judge as chairman and two water court engineers as members. A performance survey compares the benefits of the development project on a large area against the possibilities of a local disadvantage. The National Water Board of Finland, after examining the case, states whether it believes a water pollution problem will result. If the Board believes pollution will result, under the water law, a permit from the water court must be obtained. If the court's decision is not acceptable to the respective parties, those who are dissatisfied may appeal the case to the Supreme Administrative Court of Finland. (See also W73-13916) (Knapp-USGS)
W73-13953

APPROACH USED IN THE DUTCH DELTA PLAN TO COMPENSATE ADVERSELY AFFECTED INTERESTS,
Ministry of Traffic and Public Works, the Hague (Netherlands).
A. Volker.
In: Water Management-Basic Issues; Organization for Economic Cooperation and Development, Paris, France, p 415-417, 1972.

Descriptors: *Water law, *Administration, *Adjudication procedure, *Water resources development, Legal aspects, Water rights, Appropriation, Compensation, Equitable apportionment, Legal review, Water policy, Comprehensive planning.
Identifiers: *The Netherlands.

In the Netherlands, there are a great many special interest groups, each with its own objectives. In the case of the Dutch Delta Plan, the interests of small groups, such as those of oyster, mussel, and lobster fisheries, had to give way to the overriding national interest, which is protection against storms from the sea, provision of freshwater, and drainage. Therefore, in Holland, the special interests could not be protected, and it was necessary to devise means to compensate the parties affected adversely by the plan. Both informal and formal arrangements were developed for this purpose. A law provided compensation for these interests. The compensation is related to the degree that the income of the affected party is influenced. If the affected party is not satisfied with the decision of the Minister, he may appeal against the decision to the district or provincial court, and possibly, to higher courts. (See also W73-13916) (Knapp-USGS)

TWO ILLUSTRATIONS OF COMPENSATION PROCEDURES FOR OBTAINING AGREEMENT IN WATER MANAGEMENT PROGRAMMES IN SPAIN,
Consejo Superior di Investigaciones Cientificas, Madrid (Spain). Instituto de Hidrologia.
J. M. M. Mediluce.
In: Water Management--Basic Issues; Organization for Economic Cooperation and Development, Paris, France, p 419-420, 1972.

Descriptors: *Water law, *Administration, *Adjudication procedure, *Water resources development, Legal aspects, Water rights, Appropriation, Compensation, Equitable apportionment, Legal review, Water policy, Comprehensive planning.
Identifiers: *Spain.

Spain has procedures by which agreements on water resource development programs are obtained when local interests are adversely affected by projects designed to benefit the region or country as a whole. One of the choices is to pay the affected parties at levels higher than would be provided in a free market sale when their property is affected. A second choice is to relocate individuals or villages (with partial government subvention). A third choice is to protect existing lands or villages against project damages, such as floods, and in this case the developer (government or private) pays the total cost of protection. PROCEDURES USED IN THE UNITED KINGDOM FOR INTEGRATING INFORMATION NEEDED IN WATER MANAGEMENT DISCUSSIONS,
Department of the Environment, London (England) Water and Sewage Div
J. E. Beddoe
In: Water Management--Basic Issues, Organization for Economic Cooperation and Development, Paris, France, p 423-427, 1972.

Descriptors: *Water law, *Administration, *Adjudication procedure, *Water resources development, *Information exchange, Legal aspects, Water rights, Appropriation, Compensation, Equitable apportionment, Legal review, Water policy, Comprehensive planning.
Identifiers: *United Kingdom.

In England, water resources management is conducted within governmental machinery by well-established means of settling interdepartmental disputes through the Cabinet at the appropriate cabinet committee and by planning public expenditures to establish economic priorities and a comprehensive system of land use planning. Internal conflicts arise because there are three separate sets of bodies responsible for various aspects of water resources management. External conflicts arise because many water schemes change the appearance of the landscape or require the acquisition of farmland. Because works for the development of water resources or the prevention of pollution require planning permission, there is automatic liaison between the authorities responsible for controlling land use and water management bodies. Any authority promoting a major scheme discusses its proposals with nonstatutory groups such as local amenity societes, anglers associations, and representatives of farming interests. The Minister of Housing and Local Government may hold a public local inquiry to hear the case for the scheme and the objector's views. (See also W73-13916) (Knapp-USGS)
W73-13956

THE GERMAN GENERAL WATER SCHEME AS A MEANS FOR INTEGRATING DECISION MAKING INFORMATION,
Bundesministerium des Innern, Bonn (West Germany).
H. Muhleck.
In: Water Management--Basic Issues; Organization for Economic Cooperation and Development, Paris, France, p 429-431, 1972.

Descriptors: *Data collections, *Hydrologic data, *Water balance, *Comprehensive planning, Social aspects, Legal aspects, Water management (Applied), Appropriation, Administration, Water policy, Information exchange, Documentation.
Identifiers: *Germany.

The General Water Schemes (GWS) of the Federal Republic of Germany consist of a data collecting, analyzing, and evaluation process intended to provide information for the decision maker. General Water Schemes are the result of large-scale investigations of available water resources, water needs, and the possibilities for the management of the resources in terms of quality and quantity. General Water Schemes data are obtained for large-scale water management policy. Knowledge is acquired from inventories of the natural conditions in the fields of geology, geography, meteorology, hydrology, sociodemographic investigations, and economic, agricultural, and other surveys. The GWS is not published, but it also is not secret. If, for example, an industrialist is interested in knowing where he will find enough water for a new factory he will get an answer from the water authority on the basis of information contained in the GWS. (See also W73-13916) (Knapp-USGS)
W73-13957

GERMAN APPROACHES TO PAYING COSTS OF WATER MANAGEMENT PROGRAMMES,
Bundesministerium des Innern, Bonn (West Germany).
H. Muhleck.
In: Water Management--Basic Issues; Organization for Economic Cooperation and Development, Paris, France, p 443-444, 1972.

Descriptors: *Water management (Applied), *Water costs, *Cost sharing, *Water pollution control, *Cost allocation, Economics, Comprehensive planning, Administration, Grants, Taxes, Pollution taxes (Charges).
Identifiers: *Germany.

In the Federal Republic of Germany, financing of pollution control is generally based on the principle that everyone who produces pollution has to pay for the control of it. Benefits derived by water users from water pollution control do not oblige these users to share the costs of pollution control. No difference is made if waste water is discharged to a treatment plant or into the river, because the river basin must be regarded as a whole. (See also W73-13916) (Knapp-USGS)

ALTERNATIVES FOR A NEW SHRIMP LAW IN LOUISIANA,
Louisiana State Univ., Baton Rouge. Dept. of Marine Science.
H. C. Loesch.
Available from NTIS, Springfield, Va. 22151 as COM-73-10540 - Price $3.00 printed copy; $1.45 microfiche. Louisiana State University Center for Wetland Resources Sea Grant Preprint, 1973. 13 p, 6 ref. NOAA Sea Grant 2-35231.

Descriptors: *Shrimp, *Commercial shellfish, *Fish conservation, *Louisiana, Legislation, Legal aspects, Fish management, Projections, Decision making.
Identifiers: *Shrimp law proposals (La).

Ideal shrimp fishing regulations lie somewhere between the extremes of no regulations at all and regulations forbidding shrimping in any state waters. The concept of ideal varies with the person or group seeking to enhance shrimping possibilities for himself and for his group and for the objects of the shrimp management. This report deals with (1) different groups concerned with management, (2) methods of management, and (3) possible laws for Louisiana. Louisiana Wild Life and Fisheries Commission has a director, two assistant directors, and a chief of the Oyster, Water Bottoms and Seafood Division. The manner and degree of fishing intensity can be modified in several ways by law and regulations. If the catch per unit of effort has decreased to the point where overfishing a stock is taking place, then the fishing pressure should be decreased. Reducing the fishing pressure may be done by any one or a combination of the methods presented. (Woodard-USGS)

RIVER ECOLOGY AND MAN. PROCEEDINGS OF AN INTERNATIONAL SYMPOSIUM.

Held at Amherst, Massachusetts, June 20-23, 1971. 463 p. Academic Press: New York, N.Y., 1972. Pr. $11.50.
Identifiers: Books, *Ecology, Fauna, Flora, International activities, Man-made pollution, Proceedings, *River ecology, Symposiums.

This book contains an integrated series of reports by scientists, engineers and social scientists on rivers and man's interaction with them. Information included presents descriptions of the flora, fauna, chemical composition and geomorphometry of rivers; case histories of specific rivers throughout the world; full discussions of the effects of various river uses on morphometry, discharge, and sedimentation; detailed analyses of the impact of heat, radionuclides, pesticides, and industrial wastes on river ecosystems; and the economic, environmental, and political implication of multiple use of rivers. The content begins with a section describing what a river is, including a geomorphic and chemical overview, a zoological description and plant ecology in flowing water. The 2nd section, uses of a river--past and present, covers man's impact on the Columbia River, a study in water quality management on the Delaware River, man and the Illinois River, a case history of the Nile River and the River Thames and the uses of the Danube River. The 3rd section, effects of river uses, covers the following topics: regulated discharge and the stream environment; morphometric changes; sedimentation; a comparative assessment of thermal effects in some British and North American rivers; effects of pesticides and industrial waste on surface water use; radionuclides in river systems; and nutrients. The final section, rationalization of multiple use, discusses multiple use of rivers and of river systems and political aspects of multiple use. The book ends with a summary of the papers presented at the symposium.--Copyright 1973, Biological Abstracts, Inc.

LAND USE CLASSIFICATION USING TEXTURE INFORMATION IN ERTS-A MSS IMAGERY,
Kansas Univ., Center for Research, Inc., Lawrence. Remote Sensing Lab.
K. Shanmugam, R. M. Haralick, and R. Bosley

Descriptors: *Land use, *Land classification, *Remote sensing, *Aerial photography, Methodology, Satellites (Artificial), Photogrammetry, Cameras, Mapping, Surveys, Terrain analysis.
Identifiers: *ERTS imagery, Textural features, Matrix.

A procedure is described for determining the textural features on ERTS imagery. The textural features developed are extracted from the matrix of relative frequencies Pij with which two neighboring resolution cells with a specific spatial relationship occur on the image, one with grey tone i and the other with grey tone j. Such matrices are calculated for each MSS image for different angular relationships between neighboring resolution cells as well as for different distances between them. From each of the different matrices features are extracted which contain information about the homogeneity of the image, linear dependencies in grey tone values, contrast, and other image qualities; these features are used for image classification. By use of the developed textural feature extraction-classification algorithm, part of an ERTS MSS image over the California coast was processed. A 5400-square-mile area on the image was divided into 648 subimages, each covering an area of approximately 8.5 square miles. The ground truth for the use types for 629 of these images was obtained through photo interpretation. The textural features were computed for 629 of the 648 subimages. Each subimage was then classified as belonging to one of seven possible land use categories, part of the data being used for training and the remainder of the data for testing the classification accuracy. Over 70% of the test samples can be correctly classified using the textural features of only one of the four MSS images. (Woodard-USGS)

CONSTRUCTION AND USE OF AN INEXPENSIVE RAIN GAUGE,
Texas A and M Univ., College Station. Dept. of Range Science.
P. D. Ohlenbusch.
Journal of Range Management, Vol 25, No 5, p 405-406, Sept. 1972. 1 fig, 1 tab.

Descriptors: *Rain gages, *Design data, *Construction costs, *Costs, *Water measurement, Arid climates, Semiarid climates, Rainfall.

An inexpensive, wind-proof rain gage, designed for use in arid and semiarid climates, was developed for measuring precipitation at remote locations. Types of materials needed for construction are listed, the average cost for one gage is $9.00, plus one hour labor. Gages in use over one year have withstood winds in excess of 50 miles per hour. Design of the stand allows ventilation, keeping the liquid in the gage cool, and helps reduce evaporation. Gage reading is recommended along with minimum maintenance work, approximately every three weeks. (Bahre-Arizona)

he first Earth Resources Technology Satellite RTS-1) was launched on July 23, 1972. In the ven months since it was activated, over 34,000 enes of the earth have been obtained, covering major land masses and about 75 percent of the orld's land area. Some areas, such as the United ates, have been imaged at least twelve times. he purpose of the ERTS program is to provide an sessment of remote sensing from a satellite as a chnique for inventorying and monitoring the rth's resources to provide for better manageent of these resources. This Symposium proded the first open forum where the users of the RTS data had the opportunity to present the sigficant accomplishments from their investigaons. It also provided the first opportunity for presentatives of federal, state, and local ornizations to present their views on how ERTS ta are being used and will be used for solving erational resource management problems. entifiers: *ERTS.

RTS is a system; it consists of a spacecraft and a ry complex ground operation. The ground eration, to a large extent, outweighs the acecraft in complexity and significance. The acecraft carries sensors which measure and age sunlight reflected by the earth. The sensors e: (1) three return beam vidicon (RBV) television meras and (2) a multispectral scanner subsystem ISS). The two sensors are designed to measure nlight in three spectral bands which are nearly e same for both sensors; namely in the green and d portions of the visible spectrum, as well as in e infrared, which is invisible to the eye. The SS is also sensitive to a fourth band in the inared, near one-micrometer wavelength. When e satellite is not within receiving range of one of ur stations which are distributed over North nerica, measurements from each sensor are corded on wideband videotape recorders. The nsors aquire images of approximately 6 1/2 mln sq km of the earth's surface every day. The tellite also carries a data collection system CS) which acquires data transmitted from ound platforms distributed over North America. ne satellite retransmits the messages from these atforms to a central data analysis facility at the oddard Space Flight Center. ENTIFICATION AND MAPPING OF SOILS, EGETATION, AND WATER RESOURCES OF YNN COUNTY, TEXAS, BY COMPUTER NALYSIS OF ERTS MSS DATA,
rdue Univ., Lafayette, Ind.
M. F. Baumgardner, S. J. Kristof, and J. A. Henderson, Jr.
In: Symposium on Significant Results Obtained from Earth Resources Technology Satellite-1; Greenbelt, Md., March 5-9, 1973: Vol II, Summary of Results, National Aeronautics and Space Admin., Goddard Space Flight Center Publication X-650-73-127, p 17-30, May 1973. 18 fig, 1 tab.

Descriptors: *Remote sensing, *Satellites (Artificial), *Land use, *Farms, Texas, Mapping, Vegetation, Surface waters, Soil erosion, Data collections, Data processing.
Identifiers: *ERTS, *Lynn County (Tex), *Soil mapping.

ERTS multispectral data were obtained over Lynn County, Texas. The test site was chosen because it embodies a variety of problems associated with the development and management of agricultural resources in the Southern Great Plains. Preliminary results suggest that ERTS data can be used successfully in semiarid regions to accomplish the following tasks: map and measure croplands; identify and map vegetative species and management differences in rangelands; map gross soil patterns and differences which may be related to agricultural and land-use management problems and practices; map and measure areas of surface water and indicate changes occurring with the passage of time which may be related to groundwater recharge; map and measure areas of crops damaged or destroyed by hail and windstorm; and map and measure areas of bare soil and related problems of erosion, and determine conservation needs. (See also W73-14126) (Knapp-USGS)

PRELIMINARY GEOLOGIC APPLICATION OF ERTS-1 IMAGERY IN ALASKA,
Geological Survey, Washington, D.C.
E. H. Lathram, I. L. Tailleur, W. W. Patton, Jr., and W. A. Fischer.
In: Symposium on Significant Results Obtained from Earth Resources Technology Satellite-1; Greenbelt, Md., March 5-9, 1973: Vol II, Summary of Results, National Aeronautics and Space Admin., Goddard Space Flight Center Publication X-650-73-127, p 31-38, May 1973. 6 fig.

Descriptors: *Remote sensing, *Satellites (Artificial), *Alaska, *Geologic mapping, Mining, Exploration, Oil fields, Environmental effects, Vegetation, Data collections, Data processing.
Identifiers: *ERTS.

ERTS-1 and Nimbus images, largely cloud-free, were obtained over all of Alaska. Close inspection reveals numerous dark linear features that proceed great distances across the image in a generally northeast and northwest direction. Many of these structural features were not previously known or had not been put together and recognized as continuous structures in the earth's crust. These features are important in reaching an understanding of metallogenetic relationships throughout Alaska. Previously unobtainable geologic structural information may accelerate the finding of oil. A MULTIDISCIPLINARY SURVEY FOR THE MANAGEMENT OF ALASKAN RESOURCES UTILIZING ERTS IMAGERY,
Alaska Univ., College.
J. M. Miller, and A. E. Belon.
In: Symposium on Significant Results Obtained from Earth Resources Technology Satellite-1; Greenbelt, Md., March 5-9, 1973: Vol II, Summary of Results, National Aeronautics and Space Admin., Goddard Space Flight Center Publication X-650-73-127, p 39-50, May 1973. 12 fig.

Descriptors: *Remote sensing, *Satellites (Artificial), *Alaska, *Mapping, Geologic mapping, Land use, Ecology, Environment, Forests, Grasslands, Tundra, Snow surveys, Data collections, Data processing.
Identifiers: *ERTS.

Broadly structured, multidisciplinary environmental surveys of Alaskan resources are underway using ERTS data as a primary input. ERTS-1 images are being used in two ways to monitor herd activity. One is to map habitat favorable to caribou and the other is to locate and map environmental features that arise from large caribou aggregations. Typical winter grazing habitat includes mixed patterns of open spruce stands and treeless bogs. Maps of snowlines across Alaska are used to monitor the initiation and decay of the seasonal snow cover. Maps were made of the three predominant types of vegetation (moist tundra, low brush, and high brush), watershed drainages, geologic features indirectly relatable to economic minerals, and potential use classifications in an area that is susceptible to development of a transportation corridor. Mixed woods, coniferous forest, mixed herb-shrub and sedge associations, tidal flats, subalpine shrub-grass, alpine tundra, low elevation grasslands, and agricultural croplands may be distinguished. (See also W73-14126) (Knapp-USGS)
W73-14130

APPLICATION OF ERTS-1 IMAGERY TO FLOOD INUNDATION MAPPING,
Geological Survey, Iowa City, Iowa.
G. R. Hallberg, B. E. Hoyer, and A. Rango.
In: Symposium on Significant Results Obtained from Earth Resources Technology Satellite-1; Greenbelt, Md, March 5-9, 1973: Vol II, Summary of Results, National Aeronautics and Space Admin, Goddard Space Flight Center Publication X-650-73-127, p 51-70, May 1973. 14 fig, 3 tab, 3 ref.

Descriptors: *Remote sensing, *Data collections, *Mapping, *Floods, *Iowa, Surveys, Monitoring, Data collections, Data processing.
Identifiers: *Flood mapping, *ERTS.

In September, 1972, heavy rains initiated major flooding in Southwestern Iowa throughout the East and West Nishnabotna River basins. The flood crest moved downstream between September 11 and 15. ERTS-1 multispectral scanner subsystem (MSS) imagery of the area was obtained on September 18 and 19. The time period critical for imagery acquisition is at least 7 days following flood recession. The capability of satellite imagery to map late summer flooding at a scale of 1:250,000 is exhibited by the agreement of interpreted flood boundaries obtained from ERTS-1 imagery to boundaries mapped by low altitude imagery and ground methods. The synoptic coverage of ERTS-1 allowed extension of the flood mapping to the West Nishnabotna River. Satellite imagery allows rapid appraisal of the areal extent of flood inundation for entire river systems. (See also W73-14126) (Knapp-USGS)
W73-14131

AGRICULTURE, FORESTRY AND RANGELAND RESOURCES,
Oregon State Univ., Corvallis.
C. E. Poulton.
In: Symposium on Significant Results Obtained from Earth Resources Technology Satellite-1; Greenbelt, Md, March 5-9, 1973: Vol II, Summary of Results, National Aeronautics and Space Admin, Goddard Space Flight Center Publication X-650-73-127, p 71-99, May 1973. 20 fig, 9 tab, 16 ref.

Descriptors: *Remote sensing, *Satellites (Artificial), *Land use, Mapping, Forests, Grasslands, Natural resources, Planning, Data collections, Data processing.
Identifiers: *ERTS.

The application of Earth Resources Technology Satellite imagery to real and practical problems is

reviewed. In the areas of agriculture, forestry, and rangeland resources, data from the ERTS-1 satellite are of substantial significance. The large area coverage of a single scene from the ERTS-1 satellite provides a perspective of county, state, and regional problems never before possible. In addition, the repetitive coverage of the system is especially well suited to the seasonally changing scene so important to the analysis and understanding of agricultural, forestry, and rangeland resources problems. The ERTS-1 system enables both stratification and sampling estimates of relatively small areas such as counties or subregions within a state. This suggests that one of the significant benefits of the ERTS will be through development of local crop statistics not now available. (See also W73-14126) (Knapp-USGS)
W73-14132

LAND USE AND MAPPING,
Dartmouth Coll., Hanover, N.H.
D. T. Lindgren, and R. B. Simpson.
In: Symposium on Significant Results Obtained from Earth Resources Technology Satellite-1; Greenbelt, Md, March 5-9, 1973: Vol II, Summary of Results, National Aeronautics and Space Admin, Goddard Space Flight Center Publication X-650-73-127, p 100-105, May 1973. 6 fig.

Descriptors: *Remote sensing, *Satellites (Artificial), *Land use, *Mapping, Surveys, Cities, Urbanization, Farms, Recreation, Data collections, Data processing.
Identifiers: *ERTS.

The success in the level of land-use identification results primarily from the various attributes of the ERTS system. These include the ability to provide repetitive coverage, and in particular seasonal coverage; the ability to image in four bands of the electromagnetic spectrum (green, red, and two near-infrared), which allows for manipulation of various combinations of bands; and the provision by the ERTS system of computer-compatible tapes for machine processing of data. ERTS can acquire land-use data for large areas in a short period of time. By the most conservative estimates, land-use mapping by satellite is cheaper by more than an order of magnitude over land-use mapping from conventional medium-altitude aerial photography. W73-14133

MINERAL RESOURCES, GEOLOGIC STRUCTURE, AND LANDFORM SURVEYS,
Cincinnati Univ., Ohio.
L. H. Lattman.
In: Symposium on Significant Results Obtained from Earth Resources Technology Satellite-1; Greenbelt, Md, March 5-9, 1973: Vol II, Summary of Results, National Aeronautics and Space Admin. Goddard Space Flight Center Publication X-650-73-127, p 106-114, May 1973. 7 fig.

Descriptors: *Remote sensing, *Satellites (Artificial), *Geologic mapping, *Monitoring, Surveys, Hazards, Data collections, Data processing, Mapping, Structural geology.
Identifiers: *ERTS.

The availability of ERTS imagery has broadened the scale of geological thinking to a more regional format than it has commonly had. ERTS has contributed significantly to the upgrading of geologic maps. The seasonal repetition of ERTS imagery is a tremendous advantage, because the presence or absence of vegetation has a real effect on ability to map geologic boundaries. In addition, light snow cover also aids geologic mapping by etching out microrelief, so that in the course of repetition those images which show slight snow cover are of real geologic value. The most striking features visible on ERTS imagery, which are difficult to map on ordinary photography, are regional lineaments, or linear patterns in the topography, which have been believed for some years to reflect major fracture zones extending upward from the basement of the earth. It had been previously postulated that such regional lineament patterns might localize ore deposits, the foci of earthquakes, and other geological hazards. The mapping of lineaments is done almost effortlessly on ERTS imagery. In monitoring geological hazards, the repetitive nature of ERTS is important. (See also W73-14126) (Knapp-USGS)
W73-14134

WATER RESOURCES,
National Aeronautics and Space Administration, Greenbelt, Md. Goddard Space Flight Center.
V. V. Salomonson, and A. Rango.
In: Symposium on Significant Results Obtained from Earth Resources Technology Satellite-1; Greenbelt, Md, March 5-9, 1973: Vol II, Summary of Results, National Aeronautics and Space Admin. Goddard Space Flight Center Publication X-650-73-127, p 115-126, May 1973. 11 fig.

Descriptors: *Remote sensing, *Satellites (Artificial), *Water resources, Surveys, Mapping, Telemetry, Data collections, Hydrologic data, Data processing, Surface waters, Groundwater, Wetlands, Glaciology, Turbidity, Snow cover, Floods.
Identifiers: *ERTS.

ERTS-1 data are used in flooded area mapping, snow cover measurements for runoff estimates, and the relay of hydrologic data taken over widely separated and remote regions. In addition, ERTS-1 provides much improved information on glacier characteristics, the areal extent of surface water and wetlands, and physiographic and land-use characteristics. Relative to previous data gathering systems--including remote sensing systems--ERTS-1 provides a much improved combination of repetitive coverage over wide areas coupled with high spatial resolution and concistent viewing perspective over several spectral intervals. W73-14135

THE EARTH RESOURCES PROGRAM OF THE CORPS OF ENGINEERS,
Corps of Engineers, Washington, D.C.
J. W. Jarman.
In: Symposium on Significant Results Obtained from Earth Resources Technology Satellite-1; Greenbelt, Md, March 5-9, 1973: Vol II, Summary of Results, National Aeronautics and Space Admin. Goddard Space Flight Center Publication X-650-73-127, p 127-141, May 1973. 18 fig.

Descriptors: *Remote sensing, *Satellites (Artificial), *Surveys, *Mapping, Monitoring, Land use, Reservoirs, Erosion, Dams, Reservoirs, Sedimentation, Wetlands, Water pollution, Data collections, Data processing.
Identifiers: *ERTS, *Army Corps of Engineers.

The Corps of Engineers is involved in the transfer of technology learned from experimental programs like ERTS-1 to operational applications. Remote sensing technology can become a major supporting tool in accomplishing the Army Engineers' civil mission. In Alaska the Cold Regions Research and Engineering Lab is doing research which includes geologic analysis. ERTS imagery can identify topographic information such as bedding planes, glacial features, and permafrost regions. For flood control studies, ERTS has data collection platform (telemetry) capabilities. ERTS imagery is used in an operation program for inspection of dams on bodies of water as small as 10 acres. Bands 5 and Band 7 show depth or turbidity of reservoirs. (See also W73-14126) (Knapp-USGS)
W73-14136

APPLICATION OF ERTS-1 DATA TO AID I SOLVING WATER RESOURCES MANAGE MENT PROBLEMS IN THE STATE O CALIFORNIA,
California Univ., Davis.
R. H Burgy
In: Symposium on Significant Results Obtaine from Earth Resources Technology Satellite-Greenbelt, Md, March 5-9, 1973: Vol II, Summar of Results, National Aeronautics and Space Ac min, Goddard Space Flight Center Publicatio X650-73-127, p 151-166, May 1973. 14 fig

Descriptors: *Remote sensing, *Satellites (Artif cial), *Water resources, Water management (Ap plied), *California, Data collections, Hydrologi data, Mapping, Surveys, Monitoring, Turbidity Eutrophication, Snow cover, Irrigation, Reser voirs, Cities.
Identifiers: *ERTS.

Investigations within the State of California hav emphasized the direct utilization of the supple mental data source afforded by the Eart Resources Technology Satellite-1 (ERTS-1 imagery. A user-oriented study has been underwa for several years to identify and develop applica tion methodology for remotely sensed informa tion. This satellite provides a synoptic leve coverage of study areas in California on a repeti tive cycle of 18 days. A series of test areas hav been selected in Central California within the re gion designated as the San Francisco Bay an Sacramento-San Joaquin River Delta Test Site The test area includes mountain watersheds foothill valley basins; snowpack regions; larg river systems; floodwater control facilities; deltai areas; agricultural lands, both irrigated and nonir rigated; dams and reservoirs operated for multipl purposes including water supply, flood control an recreation; urban areas; and lakes, both eutrophi and oligotrophic. ERTS-1 provides the synopti coverage of the earth needed for regional wate resources planning and operations. The imagery i directly applicable for water resources an hydrologic interpretations. The spectral range (bands) provided are directly useful for both qualitative and quantitative evaluation of water-re lated parameters. The sequential coverage pro vides the capability to assess and quantify seasonal changes, specific responses, and changes on watersheds in both large and relatively smal water system components. The potential applica tions and the data quantification capabilities of ERTS-1 image analysis are extremely broad scoped. Enhancement techniques becoming available will make the imagery adaptable for many additional uses. (See also W73-14126) (K napp-USGS)
W73-14137

APPLICATION OF ERTS RESULTS TO LAND AND RESOURCE MANAGEMENT IN THE STATE OF MISSISSIPPI,
Mississippi Office of Science and Technology, Jackson.
P. T. Bankston.
In: Symposium on Significant Results Obtained from Earth Resources Technology Satellite-1; Greenbelt, Md, March 5-9, 1973: Vol II, Summary of Results, National Aeronautics and Space Admin. Goddard Space Flight Center Publication X-650-73-127, p 167-181, May 1973. 10 fig.

Descriptors: *Remote sensing, *Satellites (Artificial), *Mapping, *Land use, *Mississippi, Data collections, Data processing, Management, Planning.
Identifiers: *ERTS.

ERTS can be useful to the states in planning, resources management, and other important ways. The ERTS photomosaic of the State of Mississippi may be used to illustrate Mississippi's needs, which are similar to those of many other states. The technique of land-use mapping using ERTS data was found to be highly cost effective--ap-

roximately one-fifth the cost and the time equired using photography--requiring but a few onths to complete compared to approximately ree years for the same area using more conven-onal technology. Aimed primarily at producing a ate-wide land-use map, the availability of the nagery makes possible a number of other uses nd other derivative products, including forest pe maps, wildlife habitat maps, and other source management tools. These tools are ex-ected to be of particular importance and utility in e development of Mississippi's Coastal Zone anagement Program and state-wide land-use pol-y development. FLOODS OF 1971 AND 1972 ON GLOVER CREEK AND LITTLE RIVER IN SOUTHEASTERN OKLAHOMA,
Geological Survey, Washington, D. C.
W. O. Thomas, Jr., and R. K. Corley.
Water Resources Investigation No 5-73, 1973. 2 sheets, 7 fig, 2 map, 1 tab, 3 ref.

Descriptors: *Floods, *Flood profiles, *Flood data, *Flood discharge, *Oklahoma, Streams, Flood peak, Curves, Maps, Streamflow, Flow rates, Hydrologic data, Data collections, Watershed management, Precipitation (Atmospheric), Runoff, Flood frequency.
Identifiers: *Glover Creek (Okla), *Little River (Okla).

Heavy rains of December 9-10, 1971, and Oct. 30-31, 1972, caused outstanding floods on Glover Creek and Little River in McCurtain County in southeastern Oklahoma. Hydrologic data are presented that document the extent of flooding, flood profiles, and frequency of flooding on reaches of both streams. The data provide a technical basis for formulating effective flood-plain zoning that will minimize existing and future flood problems. The report also can be useful for locating waste-disposal and water-treatment facilities, and for the development of recreational areas. The general procedure used in defining the flood boundaries was to construct the flood profiles from high-water marks obtained by field surveys and by records at three stream-gaging stations (two on Little River and one on Glover Creek). The extent of flooding was delineated on topographic maps by using the flood profiles to define the flood elevations at various points along the channel and locating the elevations on the map by interpolating between contours. In addition, flood boundaries were defined in places by field survey, aerial photographs, and information from local residents. The accuracy of the flood boundaries is consistent with the scale and contour interval of maps (1 inch±2,000 feet; contour interval 10 and 20 feet), which means the flood boundaries are drawn as accurately as possible on maps having 10- and 20-foot contour intervals. (Woodard-USGS)

MAPS SHOWING AREAS OF POTENTIAL INUNCATION BY TSUNAMIS IN THE SAN FRANCISCO BAY REGION, CALIFORNIA,
Geological Survey, Menlo Park, Calif.
J. R. Ritter, and W. R. Dupre.
Geological Survey Miscellaneous Field Studies MF 480, 1972. 2 sheets, 2 fig, 2 map, 8 ref.

Descriptors: *Tsunamis, *Ocean waves, *Floods, *Coasts, *California, Flood damage, Highways, Flood frequency, Maps, Saline water intrusion.
Identifiers: *San Francisco Bay Region (Calif), *Inundation areas (Tsunamis), Tsunamis runup.

Areas in the San Francisco Bay coastal region that might be inundated by tsunamis with a runup of 20 feet are shown on two maps (scale 1:125,000). The maps show places where highway traffic may be disrupted as a result of inundation or damage caused by a tsunami and may be used to suggest possible routes for detours. The delineations are generalized, but may be used as a guide for further detailed study prior to development of structures such as a nuclear reactor, where safety is critically important. Tsunamis, often incorrectly called tidal waves, are long period waves usually caused by underwater seismic disturbances, volcanic eruptions, or submerged landslides. Only 1 or 2 feet high as they speed across the Pacific Ocean at about 450 miles per hour, the tsunami waves may increase in height to tens of feet as they approach a coast. Runups along the shore of more than 50 feet by tsunamis are not uncommon, and destruction by such waves may reach catastrophic proportions. A tsunami having a wave height or runup of 20 feet may arrive at the Golden Gate once every 200 years. (Woodard-USGS)

ANALOG-MODEL STUDIES OF THE EFFECTS OF RECHARGE WELLS ALONG THE HOUSTON SHIP CHANNEL ON POTENTIOMETRIC SURFACES OF THE CHICOT AND EVANGELINE AQUIFERS, HOUSTON, TEXAS,
Geological Survey, Washington, D.C.
D. G. Jorgensen.
Open file report, 1973. 2 sheets, 4 fig, 1 tab.

Descriptors: *Groundwater recharge, *Aquifer characteristics, *Recharge wells, *Artificial recharge, *Analog models, Texas, Methodology, Water levels, Pumping, Withdrawal, Model studies, Hydrographs, Maps, Hydrologic data, Channels.
Identifiers: *Houston Ship Channel (Tex).

Because of increasing concern about the continuing decline of water levels in the Houston, Texas, area, an electric analog model was used to determine the effects on the potentiometric surfaces resulting from recharging water through wells along the Houston Ship Channel into the two major aquifers, the Chicot and Evangeline. The upper model layer simulated the hydrologic conditions in the lower unit of the Chicot aquifer undifferentiated. The simulation included clay compaction and vertical leakage as well as transmissivity and storage. The lower model layer simulated the hydrologic conditions in the Evangeline aquifer which underlies the Chicot aquifer. Fifteen hypothetical wells were modeled recharging the aquifers at 1,000 gpm each while concurrently increasing the annual groundwater pumping from the aquifers. The distribution of the water recharged to aquifers by wells is tabulated. Hydrographs show the simulated decline of the altitude of the potentiometric surface of the aquifers from 1890-1980. The simulated effect is shown on the potentiometric surface of the aquifers from recharging through the 15 wells during 1973-80. (Woodard-USGS)

PREDICTING CROSSTALK IN DIGITAL SYSTEMS,
Honeywell Information Systems, Inc., Billerica, Mass.
J. A. DeFalco.
Computer Design, Vol 12, No 6, p 69-75, June 1973. 7 fig, 5 ref.

Descriptors: *Equations, *Data transmission, *Digital computers, Mathematical studies, Estimating, Electronic equipment
Identifiers: *Crosstalk.

Crosstalk, or coupling between transmission lines, is becoming an important factor in digital system design because of high transmission speeds. An engineering discussion of crosstalk is presented in terms of both its physical and mathematical developments under systems conditions. Equations are derived for predicting crosstalk, and curves of basic constants and a table of general waveforms enable the designer to rapidly quantify crosstalk in specific systems. (Little-Battelle)

A SIMPLE, OFF-LINE MASS SPECTRA DIGITIZER,
Technische Hogeschool, Eindhoven (Netherlands). Lab. of Instrumental Analysis.
J. G. Leferink, and P. A. Leclercq.
Analytical Chemistry, Vol 45, No 3, p 625-626, March 1973. 4 fig, 2 ref.

Descriptors: *Data transmission, *Laboratory equipment, *Fabrication, *Automatic control, Data collections, Instrumentation, Algorithms.
Identifiers: *Mass spectra, *Mass spectra digitizer.

An apparatus has been designed which reduces the time involved in manually measuring, writing, and punching data from a spectral chart to a simple, one-step action. The set-up described consists mainly of standard instruments to be found in an analytical laboratory. Paper tape is used as preferred over magnetic tape and cards, from a viewpoint of reliability and economics. Discussed are algorithms which assign the data obtained with this system to different arrays. By using the equipment described a saving of 70 percent in time can be achieved easily over manual methods for digitizing and punching mass spectral data. Because of the general design, the system is very versatile. The instruction-set can be changed and extended; only the software has to be adapted. If a card puncher is available, it can be substituted for the paper tape puncher. (Holoman-Battelle)

HYDROGEOLOGIC DATA FOR THE QUINNIPIAC RIVER BASIN, CONNECTICUT,
Geological Survey, Hartford, Conn.
D. L. Mazzaferro.
Connecticut Water Resources Bulletin No 26, 1973. 54 p, 1 fig, 1 plate, 6 tab, 10 ref.

Descriptors: *Groundwater resources, *Water wells, *Water quality, *Well data, *Connecticut, Geology, Aquifer characteristics, Basic data collections, Test wells, Drillers logs, Maps, Mapping.
Identifiers: *Quinnipiac River Basin (Conn).

Geologic, groundwater, and quality-of-water data are presented for the groundwater part of a water-resources inventory of the Quinnipiac River basin, Connecticut. The study area is a 360-square-mile area in south-central Connecticut drained principally by the Quinnipiac River and its tributaries and several smaller streams which drain directly to Long Island Sound. The area includes all or parts of the following towns: Ansonia, Berlin, Bethany, Branford, Bristol, Cheshire, Derby, Durham, East Haven, Farmington, Guilford, Hamden, Meriden, Middlefield, Middletown, Milford, New Britain, New Haven, North Branford, North Haven, Orange, Plainville, Prospect, Southington, Wallingford, West Haven, Wolcott, and Woodbridge. Data collected for this investigation from July 1969 to December 1971 were supplemented by data collected during previous investigations. Old but previously unpublished analyses of water are tabulated from wells in New Haven collected primarily from 1938 to 1949. (Woodard-USGS)

WATER RESOURCES OF THE YELLOWSTONE RIVER VALLEY, BILLINGS TO PARK CITY, MONTANA,
Geological Survey, Washington, D.C.
A. W. Gosling, and E. F. Pashley, Jr.
Hydrologic Investigations Atlas HA-454, 2 sheets, 1973. 7 fig, 2 map, 20 ref.

Descriptors: *Water resources, *River basins, *Valleys, *Water quality, *Montana, Geology, Surface waters, Groundwater, Water yield, Water utilization, Chemical analysis, Hydrologic data, Streamflow, Runoff, Flow rates, Aquifer characteristics, Hydrologic budget, Irrigation water, Industrial water, Municipal water, Water supply, Projections, Human population, Maps, Hydrographs.
Identifiers: *Yellowstone River Valley (Mont).

This 2-sheet atlas describes the water resources of the Yellowstone River valley from Park City to Billings, Montana, with particular emphasis on the adequacy and suitability of the water supply for the projected growth of the greater Billings area. The largest quantity of good quality groundwater in the study area is found in the unconsolidated deposits. Wells drilled into the Cretaceous rocks yield only small quantities of poor quality water,

except for the Judith River Formation and the Eagle Sandstone, which yield small quantities of water of fair quality. The annual water requirement of water users ranges from 200,000 to almost 400,000 acre-feet per year. Agricultural consumption is 180,000 to 360,000 acre-feet per year, municipal consumption is about 20,000 acre-feet per year, and industrial and commercial consumption is about 5,000 acre-feet per year. The Yellowstone River supplies about 98% of water used; the remaining 2% is supplied from groundwater. Billings is growing steadily and the population may exceed 100,000 in the 1980's. The water requirement of the city is not expected to rise above 30,000 acre-feet per year in the foreseeable future. (Woodard-USGS)
W73-14115

GROUND-WATER RESOURCES OF THE ASHUELOT RIVER BASIN, SOUTHWESTERN NEW HAMPSHIRE,
Geological Survey, Washington, D.C.
H. A. Whitcomb.
For sale by USGS, Washington, D.C., 20242, Price $1.00 per set. Hydrologic Investigations Atlas HA-441, 2 sheets, 1973. 13 fig, 1 map, 3 tab, 10 ref.

Descriptors: *Groundwater resources, *Aquifer characteristics, *Water wells, *Water quality, *New Hampshire, Water yield, Water supply, Water utilization, Hydrologic data, Geology, Water analysis, Chemical analysis, Water levels, Well data, Maps, Hydrographs.
Identifiers: *Ashuelot River basin (NH).

The purpose was to obtain information on the quantity and quality of water being used in the Ashuelot River basin in New Hampshire to determine the potential for development of additional groundwater resources. This 2-sheet atlas is intended to provide information to guide water planners in the development of water supplies to meet future needs in southwestern New Hampshire. Groundwater in the basin is normally low in dissolved solids, characteristically soft, and suitable for most domestic and industrial uses without special treatment. The yield reported by drillers of 52 wells completed in bedrock ranges from less than 1 gpm to 32 gpm and averages about 9 gpm. About 90% of the wells yield adequate supplies for normal domestic needs (2 gpm or more). The depth of penetration in bedrock ranges from about 12 to 387 feet, and the average is 127 feet. Only about 5% of the wells are more than 300 feet deep, which is generally considered to be the depth beyond which the chance of intercepting water-bearing joints and other fractures is sufficiently small not to warrant deeper drilling. (Woodard-USGS)

A HYDROLOGIC DESCRIPTION OF LAKE MINNEHAHA AT CLERMONT, FLORIDA,
Geological Survey, Winter Park, Fla.
P. W. Bush.
Florida Bureau of Geology Map Series No 54, 1972. 1 sheet, 10 fig, 1 map, 2 tab.

Descriptors: *Lakes, *Lake morphology, *Hydrologic data, *Water quality, *Florida, Geology, Rainfall, Water level fluctuations, Hydrology, Chemical analysis, Maps, Hydrographs, Groundwater movement, Water table.
Identifiers: *Lake Minnehaha (Fla), Hydrologic balance.

Lake Minnehaha is in south-central Lake County, a predominantly rural area in the heart of Florida's citrus belt. The 3.77 square-mile lake is bounded on three sides by citrus groves, with homes scattered among the trees along the shoreline. The city of Clermont borders the lake along its north shore. The formation of Lake Minnehaha and other lakes in the area is apparently due to localized differential solution of the underlying limestone by percolating groundwater, and corresponding subsidence of the surface, thus creating depressions which evolved into lakes. Since May 1945, the stage of Lake Minnehaha has fluctuated between 99.0 feet above mean sea level on April 5, 1960, and 92.7 feet above mean sea level on January 22, 1963. The stage of Lake Minnehaha has been regulated to some degree since 1956 by a discharge control structure at the outlet from Cherry Lake, about 8.6 miles downstream of the outlet from Lake Minnehaha. The quality of water in Lake Minnehaha is good, and presently appears to be stable. Comparisons of the chemical analysis of lake water sampled in March 1972 with previous analyses as far back as 1956 indicates no significant changes in concentration of any constituent for which analyses are available. (Woodard-USGS)
W73-14150

GEOLOGY AND EARTH RESOURCES OF OKLAHOMA,
Geological Survey, Norma, Okla.
K. S. Johnson, C. C. Branson, N. M. Curtis, Jr., W. E. Ham, and M. V. Marcher.
Educational Publication 1, 1972. 8 p, 7 map, 1 tab.

Descriptors: *Water resources, *Geology, *Groundwater resources, *Water quality, *Oklahoma, Surface waters, Streamflow, Aquifer characteristics, Water yield, Maps, Topography, Geomorphology, Physiographic provinces, Mineralogy, Oil fields, Lakes, Reservoirs.

This atlas of maps and cross sections describes geology and earth resources for Oklahoma. Rocks of every geologic period crop out in Oklahoma. Although most of these rocks are of sedimentary origin, consolidated from sediments deposited during the Paleozoic Era, the oldest are Precambrian granites and rhyolities formed 1.05 to 1.35 billion years ago. Average annual precipitation ranges from about 16 inches in the western Panhandle to as much as 56 inches in the southeastern part of the State. Major groundwater aquifers are stream deposits (alluvium, terrace deposits, and the Ogallala Formation), limestone, sandstone, and gypsum. These aquifers are estimated to contain more than 300 million acre-feet of water. The entire State is drained by the Arkansas and Red Rivers and their tributaries. Each year approximately 13 million acre-feet of water flows into the State through these streams, 22 million acre-feet is added by precipitation, and 35 million acre-feet flows out. The mineral content of groundwater from stream deposits, limestone, and sandstone is typically low to moderate, and the water is suitable for most purposes. Highly mineralized water, unfit for nearly any use, is present beneath freshwater in all parts of the State. (Woodard-USGS)
W73-14153

FLOODS IN BIG ROCK QUADRANGLE, NORTHEASTERN ILLINOIS,
Geological Survey, Washington, D.C.
R. T. Mycyk, G. L. Walter, and B. L. McDonald.

For salt by USGS, Washington, D.C. 20242, Price $0.75 cents. Hydrologic Investigations Atlas HA-472, 1973. 1 sheet, 10 fig, 2 tab, 2 ref.

Descriptors: *Floods, *Flood data, *Flood frequency, *Flood profiles, *Illinois, Maps, Hydrographs, Hydrologic data, Streamflow, Crest-stage gages, Water resources development, Flood control, Flood plains.
Identifiers: *Big Rock Creek (Ill).

This one-sheet atlas presents hydrologic data that can be used to evaluate the extent, depth, and frequency of flooding that affect the economic development of flood plains in the Big Rock quadrangle, northeastern Illinois. It should aid in solving existing flood problems and formulating effective flood-plain regulations that will minimize the creation of new flood problems. The data will also be useful for preparing building and zoning regulations, locating waste disposal facilities, developing recreational areas, and managing surface water in relation to the groundwater resources. The approximate areas inundated by floods along streams in the Big Rock quadrangle are delineated on a topographic map. In addition to other illustrated data, flood profiles are shown for the October 1954 and February 1966 floods for Big Rock Creek, West Branch Big Rock Creek, East Branch Big Rock Creek, Youngs Creek, and Welch Creek; they are shown for October 1954 only for Welch Creek. (Woodard-USGS)
W73-14154

VEGETATION MAP OF SOUTHERN PARTS OF SUBAREAS A AND C, BIG CYPRESS SWAMP, FLORIDA,
Geological Survey, Washington, D.C.
B. F. McPherson.
For sale by USGS, Washington, D.C. 20244, Price $0.75. Hydrologic Investigations Atlas HA-492, 1973. 1 sheet, 1 map.

Descriptors: *Vegetation, *Swamps, *Florida, Maps, Aerial photography, Remote sensing, Forests, Marshes, Pine trees, Mapping, Coastal marshes.
Identifiers: *Big Cypress Swamp (Fla), Pine forest, Hammock forest, Cypress forest.

This map showing vegetation of southern parts of Big Cypress Swamp, Florida, was made with the aid of aerial photography in conjunction with ground surveys. The basic photography used was infrared black and white taken in December 1969 at 15,000 feet (1:30,000 scale). This photography was particularly useful in delineating areas of different water depths, which, in turn, facilitated the separation of major plant associations such as deep water sloughs and marshes from relatively drier prairies. Higher elevation photography (1971) both black and white (24,000 feet) and color infrared (29,000 feet) was used to delineate large vegetal features, such as strands or coastal forests. Various colors on the map show pine forest; hammock forest, cypress forest; mixed pine and cypress forest; mixed swamp forest; coastal forest, prairies; inland marshes, slough, and ponds; coastal marshes; and saltwater prairies or marshes. (Woodard-USGS)
W73-14155

WATER AVAILABILITY, CLAY COUNTY, ALABAMA,
Geological Survey, University, Ala.
R. C. Chandler, G. C. Lines, and J. C. Scott.
Alabama Geological Survey Map 103, 1972. 22 p, 3 fig, 1 map, 3 tab, 17 ref.

Descriptors: *Water resources, *Surface waters, *Groundwater resources, *Water quality, *Alabama, Hydrogeology, Hydrologic data, Data collections, Geology, Streamflow, Flow rates, Aquifer characteristics, Water wells, Water yield, Hydrologic budget, Groundwater movement, Water utilization, Chemical analysis.
Identifiers: *Clay County (Alabama).

Total water use in Clay County, Alabama, in 1968 was estimated to be about 1 mgd, which is only a small fraction of the water available for use. Surface water supplies of 10 mgd or more are available without storage from the lower reaches of Enitachopco Creek, and supplies of 2 mgd or more are available without storage from the lower reaches of Hatchet, Little Hillabee, Crooked, Fox, Ketchepedrakee, and Talladega Creeks. Surface water stored in lakes and farm ponds in the county is estimated to be 950 million gallons. The largest source of groundwater in the county is in fractures in quartz-mica schist. Wells tapping these rocks in the central part of the county commonly yield from 25 to 50 gpm, and some may yield as much as 350 gpm. Wells in other parts of the county generally yield less than 25 gpm, but most wells yield sufficient water for domestic and stock supplies. Water in the county is generally low in dissolved minerals and is suitable for most uses. Surface water generally contains less than 50 mg/liter dissolved solids, and groundwater less than 100 mg/liter dissolved solids. (Woodard-USGS)
W73-14156

WATER RESOURCES OF THE UPPER WABASH RIVER BASIN, NORTHEASTERN INDIANA,
Geological Survey, Washington, D.C.
C. H. Tate, L. G. Davis, L. E. Johnson, and R. A. Pettijohn.
For sale by USGS, Washington, D.C., Price $1.25 per set. Hydrologic Investigations Atlas HA-433, 3 sheets, 1973. 11 map, 16 ref.

Descriptors: *Water resources, *Groundwater resources, *Surface waters, *Water quality, *Indiana, Water supply, Water utilization, Water storage, Reservoirs, Chemical analysis, Aquifer characteristics, Water wells, Water yield, Geology, Precipitation (Atmospheric), Hydrologic data, Maps, Hydrographs, Planning, Water resources development.
Identifiers: *Upper Wabash River basin (Ind).

This 3-sheet atlas describes streamflow characteristics, groundwater availability and the quality of water in the upper Wabash River basin in Northwestern Indiana. The presentation is a regional appraisal of the water resources and is intended to provide a base for planning purposes. The population of this part of the basin is approximately 360,000. The economy of the region is primarily agricultural; however, manufacturing is of major importance. Water supplies in the basin are obtained primarily from groundwater sources, and the use is fairly evenly distributed among three major categories: rural, commercial and domestic, and industrial. The use in the basin amounts to approximately 14,000 gpd per square mile. The use in Grant County, the most highly industrialized area, is 30,400 gpd per square mile. Water supplies have increased more than 25% since 1959, and during the same period, the population has increased less than 5%. Groundwater is very hard, greater than 300 mg/liter hardness, with the predominant cations, calcium and magnesium, being associated with the anions of bicarbonate and sulfate. Surface water is generally similar in chemical composition to that of groundwater but tends to be less mineralized and more variable. (Woodard-USGS)
W73-14157

GEOLOGY OF MONROE COUNTY, ALABAMA,
Geological Survey, University, Ala.
J. C. Scott.
Alabama Geological Survey Map 101, 1972. 12 p, 4 fig, 1 map, 7 ref.

Descriptors: *Geologic, Geological surveys, *Geologic mapping, *Natural resources, *Alabama, Geologic investigations, Geomorphology, Geologic formations, Geologic time, Water resources, Oil, Lignite, Limestones, Sands, Gravels, Groundwater resources.
Identifiers: *Monroe County (Alabama).

The orderly growth and economy of an area depend largely on the natural resources in or available to it. This geologic map shows the distribution of geologic units in Monroe County, Ala. and provides information that will aid in evaluating the occurrence and availability of water and other minerals that occure in them. The map was prepared by the U.S. Geological Survey, Water Resources Division, in cooperation with the Geological Survey of Alabama as a part of a comprehensive investigation of an eight county area in southwestern Alabama. Geologic units that crop out in Monroe County are of sedimentary origin and range in age from Eocene to Holocen. They consist mainly of gravel, sand, clay, sandstone, siltstone, claystone and limestone. Geologic units mapped in the county include, from oldest to youngest, the Nanafalia, Tuscahoma, Hatchetigbee, and Tallahatta Formations, and the Lisbon Formation and Gosport Sand undifferentiated, and the Jackson Group in the Eocene Series, the Oligocene Series undifferentiated, the Miocene Series undifferentiated; the Citronelle Formation in the Pliocene Series; and alluvium and terrace deposits in the Pleistocene and Holocene Series. The total thickness of Eocene and younger deposits ranges from 200 feet in the northeastern part of the country to 1,700 feet in the southwestern part. (Woodard-USGS)
W73-14158

SURFACE-WATER AVAILABILITY, FRANKLIN COUNTY, ALABAMA,
Geological Survey, University, Ala.
J. R. Harkins, D. M. O'Rear, and A. L. Knight.
Alabama Geological Survey Map 106, 1972. 11 p, 5 fig, 1 map, 1 tab, 13 ref.

Descriptors: *Water resources, *Surface waters, *Hydrologic data, *Alabama, *Water quality, Rainfall, Runoff, Streamflow, Flow rates, Water yield, Average flow, Low flow, High flow, Hydrologic budget, Water temperature, Chemical analysis, Data collections, Maps.
Identifiers: *Franklin County (Alabama).

Surface-water resources are described for Franklin County, in northwestern Alabama, in a manner that provides for a quick visual appraisal of surface water availability. The county has moderate relief and is drained primarily by Cedar and Bear Creeks. Streamflow varies considerably from one season to another. Highest monthly flows are 4 to 5 times greater than average monthly flows. Lowest monthly flows are only one-fourth to one-sixth of average flows. The average annual rainfall of 50 inches provides about 700 mgd of average runoff. The addition of 200 mgd via tributaries to Bear Creek results in a total average streamflow of 900 mgd which is about 300 times greater than actual water use in the county. Runoff from the county area is about 1.1 mgd per square mile. The water is streams generally is of a quality suitable for most uses. Cedar Creek, however, contains hard water (145 mg per liter) during periods of low flow. The temperature of water flowing in streams approximates the mean monthly air temperature and generally ranges from 3 deg C in January to 28 deg C during the summer. Temperatures of water from springs remain almost constant (15 to 17 deg C) throughout the year. (Woodard-USGS)
W73-14159

RECONNAISSANCE OF THE WATER RESOURCES OF THE TULSA QUADRANGLE, NORTHEASTERN OKLAHOMA,
Geological Survey, Oklahoma City, Okla.
M. V. Marcher, and R. H. Bingham.
Oklahoma Geological Survey Map HA-2, 4 sheets, 1971. 2 fig, 5 map, 4 tab, 20 ref.

Descriptors: *Water resources, *Surface waters, *Groundwater resources, *Water quality, *Oklahoma, Streamflow, Runoff, Precipitation (Atmospheric), Water supply, Water yield, Flow rates, Stream gages, Geology, Hydrologic data, Data collections, Aquifer characteristics, Chemical analysis, Water utilization.
Identifiers: *Tulsa area (Okla).

This 4-sheet atlas describes the water resources for the Tulsa, Oklahoma, area. Surface water is the major source of water used in the Tulsa quadrangle. The total amount of water used in 1968 is estimated at 25.4 billion gallons. Approximately 86% of this amount, or about 21.8 billion gallons, was taken from the lakes and rivers of the area; the remaining 3.6 billion gallons was provided by groundwater development. The major use of water was for municipal and industrial purposes, which accounted for about 24 billion gallons; rural domestic use accounted for the remaining 1.4 billion gallons. The most intensive area of groundwater development is in Ottawa County, where, in 1968, about 1.7 billion gallons was pumped from deep aquifers for municipal and industrial use. Because of the difficulty in obtaining sufficient water of good quality in many parts of the area, 33 rural water districts had been established by the end of 1967. These districts supplied an estimated 0.2 billion gallons of water to approximately 15,000 people; all the water was taken from surface-water sources. (Woodard-USGS)

8A. Structures

ANALYSIS OF DATA FROM INSTRUMENTATION PROGRAM, OLD RIVER LOCK,
Army Engineer Waterways Experiment Station, Vicksburg, Miss. Soils and Pavements Lab.
W. C. Sherman, Jr., and C. C. Trahan.
Available from NTIS, Springfield, Va. 22151 as AD-756 126 Price $3.00 printed copy; $1.45 microfiche. Technical Report S-72-10, June 1972. 224 p, 69 fig, 68 plate, 19 tab, 18 ref.

Descriptors: *Engineering structures, *Locks, *Design criteria, *Structural analysis, Navigation, *Mississippi River, Structural design, Settlement (Structural), Hydrostatic pressure, Fluid mechanics, Stress analysis, Strain, Foundations.
Identifiers: *Old River Lock (Mississippi River).

Old River Lock is a reinforced concrete U-frame structure located on the west bank of the Mississippi River about 300 miles above the Head of Passes. The structure was founded at a depth of 71 ft on alluvial sands of an abandoned channel deposit that extends in depth to 95 ft below the base of the structure. Old River Lock was instrumented to obtain data for use in future analysis and design of similar structures and to determine the validity of certain assumptions and procedures used to design the lock. The program included the measurement of earth and hydrostatic pressures beneath the base slab and along the walls of the lock and the measurement of stresses and strains within the base slab and walls of the lock. Hydrostatic pressures were measured with piezometers. Soil pressures on the structure and stresses and strains within the structure were measured by electrical measuring devices. Settlement of the lock was determined from observations of settlement reference points, bolts, and plates at various locations in the lock. Deflections of the walls were determined by means of wall deflection pipes and a deflectometer. (Woodard-USGS)

INSTITUTIONAL IMPLICATIONS OF U.S. DEEPWATER PORT DEVELOPMENT FOR CRUDE OIL IMPORTS,
Nathan (Robert R.) Associates, Inc., Washington, D.C.
M. R. Brant, B. L. Gladieux, H. G. Knight, J. C. Ulin, and R. E. Brown.
Available from the National Technical Information Service, $3.00 in paper copy, $1.45 in microfiche. Army Engineer Institute for Water Resources, Fort Belvoir, Virginia, Final IWR Report 73-4, June 1973. 178 p, 98 ref.

Descriptors: Institutions, *Institutional constraints, Legal aspects, *Jurisdiction, *Regulation, Ownership, Financing, Economic analysis, *Environmental control, Oil industry, Harbors, Planning, Construction, Operations, Administration, Control, Attitudes.
Identifiers: *Public interests, *Oil imports, *Deepwater Port development.

This report provides an overall appraisal of the institutional problems associates with the planning, construction, and operation of deep draft port facilities in the U.S. and adjacent waters for the reception and transshipment of imported crude petroleum. It defines the public interest in such ports; the characteristics which distinguish such ports from conventional ports; problems of legal jurisdiction as among international, Federal, State, and local levels; and the political setting within which deepwater crude petroleum ports is being considered, including public attitudes and policies at the State and local level. It analyzes problems of finance, ownership, and economic regulation; and functional characteristics and relationships of Federal departments and agencies, and State and local governments, pertaining to planning, permitting, and regulation of deepwater ports and related land-side developments. It makes recommendations with respect to required Federal legislation and organization, and institutional arrangements for public participation and intergovernmental relations. (IWR)

ANALYSIS OF COAL REFUSE DAM FAILURE, MIDDLE FORK BUFFALO CREEK, SAUNDERS, WEST VIRGINIA.
Wahler (W. A.) and Associates, Palo Alto, Calif.

Available from NTIS, Springfield, Va 22151 as PB-215 142, Price $6.75 printed copy; $1.45 microfiche. Contract report, February 1973 (Vol 1 of 2 volumes). 109 p, 80 fig, 6 tab, 28 ref. USBM Contract S0122084.

Descriptors: *Dam failure, *Coal mine wastes, *Flood damage, *West Virginia, Disasters, Foundation investigations, Drilling, On-site tests, Exploration, Surveys, Geology, Structural engineering, Engineering personnel, Data collections, Aerial photography, Evaluation, Floods.
Identifiers: *Buffalo Creek (W Va), *Saunders (W Va), Coal refuse dam.

On February 26, 1972, a coal refuse dam, owned and operated by the Buffalo Mining Company, failed near Saunders, W. Va. The resulting flooding of the Buffalo Creek Valley had national ramifications. The immediate consequences of the flooding were the deaths of 118 persons plus 7 reported missing, the loss of over 500 homes, and extensive flood damage to other property in Buffalo Creek Valley. Several investigations were started immediately after the disaster. They relied primarily on personal observations, and eyewitness reports, although the U.S. Army Corps of Engineers and the U.S. Geological Survey undertook limited field and laboratory testing. These original investigations contributed to an understanding of the Buffalo Creek Flood. This study presents a comprehensive view of the failure with essential data integrated from many sources, and an analysis of the failure based on a thorough program of subsurface exploration and sampling, field and laboratory testing, and engineering analyses. (Woodard-USGS)
W73-14163

UNCERTAINTIES RESULTING FROM MAN-MADE STRUCTURES,
R. L. A. de Jong.
In: Proceedings (Vol. III), International Symposium on Uncertainties in Hydrologic and Water Resource Systems, University of Arizona, Tucson, Dec. 11-14, 1972. p 1070-1080, (1972). 9 ref.

Descriptors: Water resources, *Structures, *Storage, *Reservoirs, *Flood frequency, Curves, Reliability, Natural streams, Discharge (Water), Decision making, Downstream, Flood plains, Hydrology, Watersheds (Basins), Dams, *Risks.

The occurrence of extreme hydrologic events on streams in their natural state can usually be described in commonly-accepted statistical terms. However, the construction of storage reservoirs interferes with the reliability of the flood-frequency curves thus derived. The modifications resulting from this interference fall into one or more of the following categories: (1) floods of small magnitude and high frequency are eliminated or reduced since all, or most, of the floodwaters are stored in the reservoir; (2) intermediate size floods are passed on downstream with little or no reduction in volume, but the flood peaks are substantially reduced by the damping effect of the reservoir, possibly with some storage; and (3) events of extremely low frequency and corresponding large magnitude may actually be increased in severity if and when the impounding structure appears to be incapable of storing and/or safely discharging the flood waters. The mechanism involved in the third category depends on three types of uncertainties, and an attempt is made to put those components in proper perspective to arrive at a strategy for decision-making related to development of downstream flood plains. Threat of catastrophic events associated with water resources structures is of particular significance in view of increasing popularity of flood-plain insurance programs. A CASE OF PLANNED PERCOLATION OF LIQUID FROM TWO PARALLEL CHANNELS,
Kiev State Univ. (USSR).
G. E. Mistetskii.
Fluid Mechanics--Soviet Research, Vol 2, No 2, p 18-23, March-April 1973. 2 fig, 6 ref.

Descriptors: *Fluid mechanics, *Flow, *Percolation, *Channels, Drains, Mapping, Mathematics, Equations.
Identifiers: USSR.

A solution is presented to the problem of systematic steady-state percolation of heavy, incompressible fluid from parallel channels to a noncontinuous, ideal drain. A characteristic function is found for percolation flow using the method of sequential conformal mapping. A special case of the arrangement when the drain is midway between channels is considered. A complex percolation potential is found, and numerical examples are given. (Josefson-USGS)

INTERACTION AND THE SUSPENSION OF COARSE PARTICLES IN A HIGH-CONCENTRATION FLOW,
Yu. N. Krivenko.
Fluid Mecahnics--Soviet Research, Vol 2, No 2, p 7-17, March-April 1973. 4 fig, 13 ref

Descriptors: *Fluid mechanics, *Flow, *Coarse sediments, *Suspension, Settling velocity, Equations.
Identifiers: USSR.

The mechanism of suspension of discrete particles in high-concentration flows is considered. Analysis of the interaction of solid particles in a two-phase, high-concentration flow reveals that the forces generated at the instant of particle collisions with one another or with the wall are many times the weight of particles and can result in their suspension in horizontal flow. The angular velocity produced in the collision of rigid particles and the flow of fluid around them can represent a source of suspension of coarse particles in upper, low-concentration layers of flow. HYDROLOGIC ENGINEERING METHODS FOR WATER RESOURCES DEVELOPMENT: VOLUME 1--REQUIREMENTS AND GENERAL PROCEDURES.
Hydrologic Engineering Center, Davis, Calif.

Available from NTIS, Springfield, Va., 22151 AD-758 904 Price $6.00 printed copy; $1.45 microfiche. Report HEC-IHD-100, (Vol 1), October 1971.

Descriptors: *Water resources development, Engineering, *International Hydrological Decade, *Hydraulic engineering, Methodology, Flood protection, Flood control, Reservoirs, Water supply, Hydroelectric power, Surface waters, Computer models, Computer programs.

This report is intended to respond to the need throughout the world for hydrologic engineering methods that can be applied in regions of sparse data. The report is to consist of 12 volumes, of which this is volume 1. It constitutes a contribution of the United States to the International Hydrological Decade (IHD). Procedures and methods that have been used successfully in Corps of Engineers studies or are believed to be of significant interest are described. Descriptions of computer programs and many recently developed techniques for use in hydrologic studies are included. (Woodard-USGS)
W73-13757

MODEL TEST OF BOX INLET DROP SPILLWAY AND STILLING BASIN PROPOSED FOR TILLATOBA CREEK, TALLAHATCHIE COUNTY, MISS.,
Minnesota Univ., Minneapolis. St. Anthony Falls Hydraulic Lab.
F. W. Blaisdell.
Agricultural Research Service, United States Department of Agriculture, ARS-NC-3, January 1973, 50 p, 45 fig, 3 ref.

Descriptors: *Scour, *Riprap, *Drops (Structures), *Spillway crests, *Hydraulic design, *Discharge coefficients, *Stage-discharge relations, *Weirs, Channel erosion, Hydraulic structures, Bank stabilization, Spillways, Stilling basins, Energy dissipators, Hydraulic models, Open channels, Discharge (Water), Flow characteristics, Flow control, Tractive forces, Velocity, Dams, Manning formula, Tailwater, *Mississippi.

A hydraulic model was used to experimentally design the riprap in the approach and exit channels for a box inlet drop spillway and to develop a spillway crest to fit a predetermined head discharge relationship. Excessive scour in the approach channel near the structure was eliminated by adding riprap protection. Areas to be protected by each riprap size were determined from isovels measured in the approach channel. Sizes of riprap required to resist movement were based on the Manning formula. The dropdown of the overbank flow into the approach channel near the structure and the resulting erosion of the approach channel banks were eliminated by designing the trapezoidal weir box inlet crest so the head on the crest at bank-full discharge was equal to the depth of flow. Equations for the head-discharge relationship were derived. The computed and observed discharge coefficients were compared; the agreement was within 6 percent. The self formed shape of the sand-bed downstream channel was determined. Site requirements necessitated modifications of this shape. Experimental design methods were used to determine the placement and sizes of riprap required to protect the downstream channel. The effect of tailwater depths less than the design depth was shown to be minimal. (Dodge-ARS)

WAVE FORCES ON PILE INCLUDING DIFFRACTION AND VISCOUS EFFECTS,
Chicago Bridge and Iron Co., Plainfield, Ill. Marine Research and Development.
S. K. Chakrabarti.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 99, No HY8, Paper 9935, p 1219-1233, August 1973. 5 fig, 10 ref, append.

Descriptors: *Waves (Water), *Piles (Foundations), *Coastal structures, *Refraction (Water waves), *Drag, Vortices, Unsteady flow, Fluid mechanics.
Identifiers: *Wave forces.

Linearized Navier-Stokes equations, including linear viscous terms, were used in an investigation of the oscillatory wave forces on a vertical circular cylindrical structure. Stokes' nonlinear gravity wave theory was applied to the analysis, and expressions for the wave pressures and forces on the cylinder were derived. The effect of diffraction of waves due to the presence of the cylindrical object is included in the derivation. The relative importance of the higher order terms in the nonlinear wave components and the viscous terms is shown. The theory is compared with test results on the inertia-predominant wave forces on a vertical cylindrical pile. (Knapp-USGS)
W73-13963

IRROTATIONAL FLOW WITH IRREGULAR BOUNDARY SHAPES,
Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
A. G. Mercer.

Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 99, No HY8, Paper 9937, p 1209-1217, August 1973. 2 fig, 1 tab, 7 ref, append.

Descriptors: *Uniform flow, *Computer programs, Finite element analysis, Flow nets, Mathematical models, Vortices, Hydrodynamics.

An algorithm for the numerical solution of two-dimensional irrotational flows based on an inverse transformation is presented as an efficient means of solving flows with irregular boundary shapes. Using the intersections of a set of streamlines and equipotential lines as computational nodal points, the algorithm determines the areas of high velocity flow so as to increase the accuracy in these areas. The algorithm is particularly well suited to modern high speed computers, and FORTRAN statements are given. Since the program operates on many different boundary shapes with no internal alterations, it is suitable for use by persons with limited background in numerical procedures. (Knapp-USGS)

HAMLIN BEACH STATE PARK COOPERATIVE BEACH EROSION CONTROL PROJECT, LAKE ONTARIO, MONROE COUNTY, NEW YORK (FINAL ENVIRONMENTAL IMPACT STATEMENT).
Army Engineer Districts, Buffalo, N.Y.

Available from NTIS, Springfield, Va. 22151 as EIS-NY-73-0088-F, Price $3.00 printed copy; $1.45 cents microfiche. July 3, 1972. 56 p, 1 plate, 7 tab.

Descriptors: *Beach erosion, *Erosion control, *Lake Ontario, *New York, Reviews, Evaluation, Recreation facilities, Engineering construction, Environmental effects, Wildlife conservation, Aesthetics, Social aspects, Economics.
Identifiers: *Hamling Beach State Park (N.Y.), *Environmental Impact Statements.

A review is presented of the documents concerning the proposed action and the views of other interested agencies and the concerned public relative to the various practicable alternatives in accomplishing the construction of a beach erosion control project at Hamlin Beach State Park, Lake Ontario, Monroe County, N.Y. The possible consequences of these alternatives were studied according to environmental, social well-being, and economic effects, including regional and national development, and engineering feasibility. THE CULTURE AND METAMORPHOSIS OF THE TARPON, TARPON ATLANTICUS CUVIER AND VALENCIENNES,
G. Dahl.
Zool Revy, Vol 33, No 3/4, p 85-89, 1971, Illus, English summary.
Identifiers: Artemia-salina, *Culture, Elops-saurus, Food, *Metamorphosis, Protozoa, Rotatoria, *Tarpon, Tarpon-atlanticus.

On the north coast of Colombia, at the beginning of the rainy season in June 1964, large amounts of leptocephalus-larvae, of T. atlanticus were caught. They were migrating into brackish and freshwater wheer they underwent metamorphosis. In aquaria they survived in water ranging in salinity from nil to 3.6%. Most of the leptocephalus were T. atlanticus, but Elops saurus L. were also present. As fry, T. atlanticus 1st breathed air and ate Protozoa and Rotatoria. Then they took nauplius larvae of Artemia salina. Two weeks after metamorphosis they ate other small crustaceans. A month after metamorphosis they began eating other fish-fry. At the end of 1966 artificially bred specimens, 60-70 cm long, of this economically important species, which never before had been successfully cultured were ready to be released.--Copyright 1972, Biological Abstracts, Inc.

FOOD HABITS AND GROWTH OF CHANNEL CATFISH FRY, ICTALURUS PUNCTATUS,
Iowa State Conservation Commission, Des Moines.
D. L. Bonneau, J. W. McGuire, O. W. Tiemeier, and C. W. Deyce.
Trans Am Fish Soc. Vol 101, No 4, p 613-619. 1972. Illus.
Identifiers: Algae, *Channel catfish, *Growth, *Food habits, Ictalurus-punctatus, Plankton, Zooplankton.

Polyethylene-lined rearing ponds were used in 1968 and 1969, in the study of effects of certain treatments on food habits and growth of young-of-the-year I. punctatus. Two ponds were used in 1968, and fed pond and a pond enriched with inorganic fertilizer. In 1969, the study was expanded to 4 ponds; 2 receiving treatments similar to those in 1968, a control pond, and a fed-and-enriched pond. Weekly samplings of fish, benthos, plankton, and water provided data for determining treatment effects. Enrichment with 2 inorganic fertilizers variously affected the algae, zooplankton, and benthic

communities. No significant difference was noted in the mean growth (weight and length) of fry in the fed pond and in the fed-and-enriched pond. Fish production and survival were not improved by enriching ponds. Feeding habits of young-of-the-year channel catfish varied with availability of food items. Analyses of stomach contents indicated that fry, after accepting supplemental feed, consumed many natural foods in direct proportion to their availability. Fry in continually fed ponds were approximately 5 wk old when they first accepted supplemental feed, which thereafter comprised most of the food they ate and was responsible for their consistent growth rate. The advantage of supplemental feed became especially apparent as the fry became larger and demand for food increased. In the absence of supplemental feed, nonavailability of adequate natural food limited growth.--Copyright 1973, Biological Abstracts, Inc.

THE DISTRIBUTION AND LIFE HISTORY OF SOUTH AMERICAN FRESHWATER CRABS (AEGLA) AND THEIR ROLE IN TROUT STREAMS AND LAKES,
California State Dept. of Fish and Game, Sacramento. Inland Fisheries Branch.
J. W. Burns.
Trans Am Fish Soc, Vol 101, No 4, p 595-607, 1972, Illus.
Identifiers: Aegla, *Argentina, California, *Chile, *Crabs (Freshwater), Distribution patterns, Insects, Lakes, Salmo-gairdneri, Salmo-trutta, Streams, *Trout diets.

Freshwater crabs (Aegla) were collected in Chile and Argentina in 1971, and shipped to California, for laboratory observations to determine the desirability of introducing them into California as forage for trout. Stomachs and scales taken from Chilean trout were examined to determine the importance of Aegla in the diet and growth of trout. Aegla made up 66% of the dry weight of the identifiable stomach contents of river-dwelling rainbow trout (Salmo gairdneri) and 67% of the stomach contents of river-dwelling brown trout (S. trutta). However, they were not as important as fish in the diets of lake-dwelling trout. The growth rates of Chilean trout sampled from waters containing Aegla were rapid, suggesting that the abundant crab populations probably contribute significantly to the large size attained by Chilean trout. Laboratory observations confirmed that Aegla are detritivores and herbivores; in addition, they were found to be predators. Besides eating detritus and periphyton, they preyed on aquatic insects and fish. In an experiment, they crawled through 26 cm of rubble and gravel-sized rocks into two simulated trout redds and consumed 76% of the trout embryos and alevins. Because of the possible deleterious effects Aegla predation could have upon salmonid reproduction, the proposal to introduce them into California waters was rejected.--Copyright 1973, Biological Abstracts, Inc.

THE SETTING AND GROWTH OF THE MANILA CLAM, VENERUPIS JAPONICA (DESHAYES), IN HOOD CANAL, WASHINGTON,
Washington Univ., Seattle. Fisheries Research Inst.
T. T. Nosho, and K. K. Chew.
Available from the National Technical Information Service as COM-72-11429. In: 1971 Proceedings of the National Shellfisheries Association, Vol 62, p 50-58, 1972. 7 fig, 1 tab, 24 ref.
Descriptors: *Shellfish farming, *Clams, *Washington, Growth stages, Spawning, Productivity, Larvae, Aquatic environment, Life cycles.
Identifiers: *Venerupis japonica, *Hood Canal (Wash.), Spatfall, Artificial substrata, Japan

The Manila clam (Venerupis japonica) was accidentally introduced to the Pacific coast of North America with shipments of Pacific oyster seed from Japan. Some of the environmental conditions required for its successful setting and growth, specifically, the relationship between larvae and spat and the substrata were investigated. The influence of artificial substratum types on the setting of metamorphosing larvae, and subsequent growth of spats in these substrata were evaluated, the period of major spatfall in Hood Canal (Washington) determined, and the growth rate of spat to harvestable size estimated. Collectors containing seven artificial substratum types appeared to catch the spat of Venerupis japonica equally well at two study areas. Major period of spawning occurred from May through September. Spatfall was heaviest from June through October. Length frequency distributions of populations at three beaches were used to estimate growth and four age stages. Mean length at annual age increments was as follows: 24 mm after one year, 36 mm after two years, 40 mm after three years and 44 mm after four years. The growth rate suggests that conditions are favorable in Hood Canal Waters. (Jones-Wisconsin)

EXPEDIENCY OF FALL CHINOOK SALMON ACCLIMATIZATION, (IN RUSSIAN),
Moscow State Univ. (USSR).
A. I. Smirnov.
Vestn Mosk Univ Ser 6 Biol Pochvoved. Vol 27, No 2, p 14-18. 1972 (English summary).
Identifiers: Acclimatization, *Chinook salmon, Fall, *Salmon, Fisheries management.

The catch of chinook salmon is less in Asian than in North American waters due to the morphological and ecological homogeneity of the populations. Chinook salmon in the USSR is present only in the summer spawning form. It does not enter many rivers and tributaries, and its range is discontinuous. There are races in North American waters with non-identical data of movement and spawning. It is suggested that the fall race breeds near outlets of the subsoil waters; it's fry lives in the rivers for a short period. It is possible to introduce chinook salmon in Kamchatka and Sakhalin Rivers, the Amur and the Caspian Sea, large lakes and artificial reservoirs of the European and Siberian areas of the USSR.--Copyright 1972, Biological Abstracts, Inc.

BIOLOGICAL VALUE OF FISH AT DIFFERENT TROPHIC LEVELS IN RELATION TO THE CHOICE OF FISH FOR AQUACULTURE AND ACCLIMATIZATION, (IN RUSSIAN),
A. F. Karpevich.
Tr Vses Nauchno-Issled Inst Morsk Rybn Khoz Okeanogr 76 p 7-55 1970 English summary.
Identifiers: Acclimatization, *Aquaculture, Biological studies, Fish (Somatic productivity), Salmon, Sturgeon, Trophic levels.

The relative coefficient of somatic productivity of fish depends on the amount of and rate of mass accumulation during sexual maturation. Among fish with a single maturation period the lowest coefficient was observed in planktophages. Usually planktophages have the lowest rate of weight increase and the higest rate of maturity, which promotes quicker turnover of organic food substances in bodies of water. The same chain, made up of pelagic organisms, belongs to the 'cheapest' in food consumption. The food chain of ground fish, especially predaceous species, is biologically the most 'expensive.' However, due to the low somatic productivity the commercial production from short-cycle planktophages is not high. With large consumption rates in predaceous fish the rate of weight increase is high. The somatic productivity is also often high. In this case the commercial product acquires a high quality. The highest coefficient of productivity occurs in salmon and sturgeon.--Copyright 1972, Biological Abstracts, Inc.

CAGE CULTURE OF BLACK BULLHEADS, ICTALURUS MELAS (RAFINESQUE), IN NORTH DAKOTA,
North Dakota Univ., Grand Forks.
D. R. Hahn.
Available NTIS, Springfield, Va 22151 as COM-72-11169, Price $3.00 printed copy; $1.45 microfiche. M Sc Thesis, August 1972. 67 p, 4 fig, 15 tab, 81 ref.

Descriptors: *Catfishes, *Fish hatcheries, *Fish management, *North Dakota, Commercial fish, Fisheries, Economics, Growth stages, Fish diets, Fish diseases, Fish physiology, Mortality, Methodology, Evaluation.
Identifiers: *Black bullhead catfishes, Food conservation, Ictalurus melas.

The economic feasibility of rearing black bullhead catfish, Ictalurus melas (Rafinesque), in cages in North Dakota was investigated. The 2-year study consisted of rearing different population densities of fish with high coefficients of condition and stunted fish in cages. Bullheads did not have growth and feed conversion capacities of other Ictaluridae under similar culture; mortality was comparable. Water temperature was an important factor in regulating feeding activity and thus, growth. The flesh of cage reared bullheads had a higher lipid content than their wild counterparts. Because of low market value and poor feed conversion abilities, cage culture of bullheads in North Dakota is not profitable. (Woodard-USGS)

Application of the Oxygen Method in Algotoxic Investigations,
W73-13906 5C

Mercury and Other Trace Metals in the Environment. A Compilation of Federal Government Research Projects and Surveys August 1971.
W73-14089 5B

Major Inorganics,
W73-14189 5A

Trace Inorganics,
W73-14190 5A

ANEMOMETERS

Water Resource Observatory, Wind Data, Water Years 1970 and 1971,
W73-13714 7C

ANIMAL POPULATIONS

A Probabilistic Approach to the Dynamics of Natural Populations of the Chydoridae (Cladocera, Crustacea),
W73-14057 2H

ANNELIDA

Biota of Freshwater Ecosystems, Identification Manual No. 4, Freshwater Polychaetes (Annelida) of North America,
W73-13739 2I

Biota of Freshwater Ecosystems Identification Manual No. 8, Freshwater Leeches (Annelida: Hirudinea) of North America,
W73-13743 2I

ANOXIA

Review of Some Direct Effects of Spoil Dumping on Marine Animals,
W73-13782 5C

ANTECEDENT PRECIPITATION

Infiltration and Antecedent Precipitation,
W73-13965 2G

NTICATALYTIC KINETIC METHOD
Anticatalytic Microdetermination of Mercury Using Cerium-Arsenite Reaction,
W73-14200 5A

QUACULTURE
Biological Value of Fish at Different Trophic Levels in Relation to the Choice of Fish for Aquaculture and Acclimatization, (In Russian),
W73-14152 8I

QUATIC ALGAE
Carbon Monoxide in the Biosphere: CO Emission by Fresh-Water Algae,
W73-13903 5B

New and Rare Species of Some Green Algae From Bangladesh,
W73-14099 5A

Kinetics of Amino Acid Influx Into Nitella Flexilis,
W73-14186 5C

Observations on the Structure of Some Forms of Gomphonema Parvulum Kutz. II. The Internal Organization,
W73-14187 5C

QUATIC ENVIRONMENT
Ecological Concept of the Coastal Zone in the Great Lakes,
W73-14193 5B

QUATIC FAUNA
Biota of Freshwater Ecosystems, Identification Manual No. 1, FRESHWATER PLANARIANS TURBELLARIANS) OF NORTH AMERICA,
W73-13736 2I

Biota of Freshwater Ecosystems, Identification Manual No. 2, THE GENUS Argulus (CRUSTACEA; BRANCHIURA) OF THE UNITED STATES,
W73-13737 2I

Biota of Freshwater Ecosystems, Identification Manual No.3, Freshwater Sphaeriacean Clams (Mollusca: Pelecypoda) of North America,
W73-13738 2I

Biota of Freshwater Ecosystems, Identification Manual No. 4, Freshwater Polychaetes (Annelida) of North America,
W73-13739 2I

Biota of Freshwater Ecosystems, Identification Manual No. 5, The Freshwater Amphipod Crustaceans (Gammaridae) of North America,
W73-13740 2I

Biota of Freshwater Ecosystems, Identification Manual No. 6, Aquatic Dryopoid Beetles (Coleoptera) of the United States,
W73-13741 2I

Biota of Freshwater Ecosystems, Identification Manual No. 7, Freshwater Isopods (Asellidae) of North America,
W73-13742 2I

Biota of Freshwater Ecosystems Identification Manual No. 8, Freshwater Leeches (Annelida: Hirudinea) of North America,
W73-13743 2I

Biota of Freshwater Ecosystems Identification Manual No. 9, Crayfishes (Astacidae) of North and Middle America,
W73-13744 2I

AQUATIC PLANTS
Aquatic Plants from Minnesota Part 4 - Nutrient Composition,
W73-13716 2I

AQUATIC PRODUCTIVITY
Nutrient Cycling and Productivity of Dystrophic Lake-BOG Systems (Part A),
W73-14185 5C

Estimation of Estuarine Marsh Productivity,
W73-14199 5B

AQUATIC WEED CONTROL
Overwinter Drawdown: Impact on the Aquatic Vegetation in Murphy Flowage, Wisconsin,
W73-13723 5C

Improving Surface Water Conditions Through Control and Disposal of Aquatic Vegetation, Phase II,
W73-13983 5G

AQUEOUS SOLUTIONS
Photolysis of Ethylenethiourea,
W73-14194 5C

Anticatalytic Microdetermination of Mercury Using Cerium-Arsenite Reaction,
W73-14200 5A

AQUIFER CHARACTERISTICS
Analog-Model Studies of the Effects of Recharge Wells Along the Houston Ship Channel on Potentiometric Surfaces of the Chicot and Evangeline Aquifers, Houston, Texas,
W73-13762 7C

Ground Water in the Eugene-Springfield Area, Southern Willamette Valley, Oregon,
W73-14113 2F

Ground-Water Resources of the Ashuelot River Basin, Southwestern New Hampshire,
W73-14116 7C

AQUIFERS
Calibration of Distributed Parameter Groundwater Flow Models Viewed as a Multiple-Objective Decision Process Under Uncertainty,
W73-13699 2F

AQUITARDS
Evaluation of Hydrological Properties of Aquitards and Their Role in Groundwater Management,
W73-13653 2F

ARCTIC
Implications of Waste Treatment Processes and Arctic Receiving Waters,
W73-13748 5B

Modeling Snowmelt Runoff in an Arctic Coastal Basin,
W73-14109 5B

ARGENTINA
The Distribution and Life History of South American Freshwater Crabs (Aegla) and Their Role in Trout Streams and Lakes,
W73-13902 8I

ARGENTINA (COLORADO RIVER)
Infiltration Analysis and Its Application on Irrigation Design in the Inferior Valley of Colorado River (In Spanish),
W73-13805 3F

ARGULUS
Biota of Freshwater Ecosystems, Identification Manual No. 2, THE GENUS Argulus (CRUSTACEA; BRANCHIURA) OF THE UNITED STATES,
W73-13737 2I

ARIZONA
Price Elasticity of Demand for Municipal Water: A Case Study of Tucson, Arizona,
W73-13698 6D

'Horizontal' Wells,
W73-13997 4B

Arizona Agri-File.
W73-14006 3F

Some Current Problems of Rain Stimulation Research,
W73-14179 3B

ARKANSAS
Floods of December 1971 in Western Arkansas,
W73-13668 2E

ARMY CORPS OF ENGINEERS
The Earth Resources Program of the Corps of Engineers,
W73-14136 7B

ARTIFICIAL RECHARGE
Analog-Model Studies of the Effects of Recharge Wells Along the Houston Ship Channel on Potentiometric Surfaces of the Chicot and Evangeline Aquifers, Houston, Texas,
W73-13762 7C

Catalog of Recharge Basins on Long Island, New York, in 1969,
W73-14103 4B

ASELLIDAE
Biota of Freshwater Ecosystems, Identification Manual No. 7, Freshwater Isopods (Asellidae) of North America,
W73-13742 2I

ASHUELOT RIVER BASIN (NH)
Ground-Water Resources of the Ashuelot River Basin, Southwestern New Hampshire,
W73-14116 7C

ASIA
Regional Workshop on Water Resources, Environment, and National Development.
W73-13966 5G

ASPERGILLUS NIDULANS
Ammonium Regulation in Aspergillus Nidulans,
W73-14068 5B

ASTACIDAE
Biota of Freshwater Ecosystems Identification Manual No. 9, Crayfishes (Astacidae) of North and Middle America,
W73-13744 2I

ASWAN HIGH DAM
Effect of River Outflow Management on Marine Life,
W73-14018 2L

ATLANTIC COASTAL PLAIN
Structural and Stratigraphic Framework, and Spatial Distribution of Permeability of the Atlantic Coastal Plain, North Carolina to New York,
W73-13666 2F

ATLANTIC SALMON
Behavior of Young Atlantic Salmon (Salmo salar) Exposed to or Force-Fed Fenitrothion, an Organophosphate Insecticide,
W73-14083 5C

ATMOSPHERE
Estimate of the Content of Spray Drops in the Near-Water Layer of the Atmosphere,
W73-13690 2B

ATTISHOLZ PROCESS
Purification of Waste Waters of the Forest Products Industry, as Illustrated by Examples From Swiss Mill Operations (Rensing av avlopsvann i treforedlingsindustrien belyst ved eksempler fra sveitsiske bedrifter),
W73-14015 5D

The Attisholz Experimental Purification Unit (Die Attisholz-Versuchs-Reinigungs-Anlage).
W73-14030 5D

ATTITUDES
Survey of Estuarine Site Development Lagoon Homeowners, Ocean County, New Jersey,
W73-13818 6B

AUSTIN (TEX)
Annual Compilation and Analysis of Hydrologic Data for Urban Studies in the Austin, Texas Metropolitan Area, 1971,
W73-14111 4C

AUTOMATIC CONTROL
Minicomputer for Regulation and Control of Effluent Discharges (Minidator for styrning och kontroll av avlopp),
W73-14022 5G

A Simple, Off-Line Mass Spectra Digitizer,
W73-14093 7C

AUTOMATION
Combined Sampling and Flow Measurement,
W73-13708 5A

Automatic Control at the Milton Keynes Works,
W73-13787 5D

Automation in Water Protection Against Pollution,
W73-13807 5A

Automated Solvent Extraction for the Determination of Trace Metals in Water by AAS (Atomic Absorption Spectrophotometry),
W73-14047 5A

A Study of Nutrient Variations in the Surface and Mixed Layer of Monterey Bay Using Automatic Analysis Techniques,
W73-14090 5B

AZERBAIJAN (USSR)
Theoretical Foundations for the Study of Productivity in Azerbaijanian Lakes and Reservoirs,
W73-13728 5C

AZOTOBACTER VINELANDII
Interactions of Tetrahymena pyriformis, Escherichia coli, Azotobacter vinelandii, and Glucose in a Minimal Medium,
W73-14095 5C

BACILLUS SUBTILIS
Oxygen Toxicity and the Superoxide Dismutase,
W73-14069 5C

BACTERIA
Bacteriological Procedures for Analyzing Wet and Dried Poultry Feces,
W73-13841 5A

Inoculation Techniques--Effects Due to Quality and Quantity of Inoculum,
W73-14077 5A

BAFFLES
Baffle Waste Treatment Tank,
W73-13975 5D

BANGLADESH
New and Rare Species of Some Green Algae From Bangladesh,
W73-14099 5A

BASS
The Effects of Water Management Practices on the Movement of Largemouth Bass,
W73-13654 2I

BATCH CULTURES
pH and Eh Control of Cultures of Sulphate-Reducing Bacteria,
W73-14191 5C

BAY OF AUDIERNE
The Fluctuations in Coastal Hygrophilous Vegetation of the South Central Portion of the Bay of Audierne,
W73-13808 2L

BAYS
Inventory and Evaluation of Information on Delaware Bay, Volume 3,
W73-13697 2L

Jefferson National Bank at Sunny Isles V. Metropolitan Dade County (Ownership of Fill Placed Beyond Bulkhead Line).
W73-13880 6E

A Checklist of the Fishes of the Monterey Bay Area Including Elkhorn Slough, The San Lorenzo, Pajaro and Salinas Rivers,
W73-14101 2L

Trinity Bay Study: Dye Tracing Experiments,
W73-14164 5B

BEACH EROSION
Hamlin Beach State Park Cooperative Beach Erosion Control Project, Lake Ontario, Monroe County, New York (Final Environmental Impact Statement).
W73-13746 8D

BEANS
Actual Potential and Equilibrium Evaporation for a Bean Field in Southern Ontario,
W73-13721 2D

BEDS
The Draft United Nations Convention on the International Seabed Area--Department of Defense Considerations,
W73-13862 6E

BEETLES
Comparative Studies on the Dependence of Aquatic Coleoptera to Their Environment in the Area of Neuss,
W73-14005 2I

BELGIUM (RIXENSART HEATH)
Phytosociological and Mycological Exploration of the Rixensart Heath and the Land Approaching it,
W73-14181 2I

BENEFITS
Conditional Chance Constrained Model for Reservoir Control
W73-13700 4A

BENOMYL
Determination of Benomyl Residues in Soils and Plant Tissues by High Speed Cation Exchange Liquid Chromatography.
W73-14195 5A

BENTHIC FAUNA
Effects of Spoil Dumping on the Benthic Invertebrates of the Sound,
W73-13783 5C

BENTHOS
Experience in the Study of Bottom Associations in the Dnieper River Reservoirs and their Productivity,
W73-13729 5C

CANADA CENTRE FOR INLAND WATERS
The Canada Centre for Inland Waters: An Approach to Research Co-Ordination,
W73-13942 6E

CANADA (ONTARIO)
Actual Potential and Equilibrium Evaporation for a Bean Field in Southern Ontario,
W73-13721 2D

CANADA (PEACE-ATHABASCA DELTA)
Evaluation of Ecological Effects of Recent Low Water Levels in the Peace-Athabasca Delta,
W73-13775 5C

CARBON DIOXIDE
Yield of Flue-Cured Tobacco and Levels of Soil Oxygen in Lysimeters with Different Water Table Depths,
W73-13908 3F

Methane in Lake Kivu: New Data Bearing on its Origin,
W73-14016 2H

CARBON DIOXIDE EXCHANGE
Eco-Physiological Investigations on Wild and Cultivated Plants in the Negev Desert: II. The Influence of Climatic Factors on Carbon Dioxide Exchange and Transpiration at the End of the Dry Period,
W73-13792 2D

CARBON MONOXIDE
Carbon Monoxide in the Biosphere: CO Emission by Fresh-Water Algae,
W73-13903 5B

CARCINOGENS
An Improved Bacterial Test System for the Detection and Classification of Mutagens and Carcinogens,
W73-14094 5A

CARP
Elements of Energy Balance in Grass Carp (Ctenopharyngodon idella Val.): III. Assimilability of Proteins, Carbohydrates, and Lipids by Fish Fed with Plant and Animal Food,
W73-13797 2I

Change of Carp Helminth Fauna due to Summering in Streams,
W73-13910 2I

CARPATHIANS
Groundwater Distribution, Karst, and Mudflows in the Carpathian Zone (Zakonomernosti raspredeleniya podzemnykh vod, karst i seli Karpatskoy zony),
W73-14143 2F

CASPIAN SEA
Radioactivity of Caspian Sea Sediments and Their Deposition Rate (Radioaktivnost' i skorost' obrazovaniya osadkov Kaspiyskogo morya),
W73-13752 2J

CATALYSTS
Waste Water Purification Through Catalytic Wet Oxidation (Abwasserklaerung durch katalytische Nassoxydation).
W73-14010 5D

CATENARY SOIL RELATIONSHIPS
Catenary Soil Relationships in Israel: II. The Bet Guvrin Catena on Chalk and Nari Limestone Crust in the Shefela,
W73-13720 2G

CATFISHES
Levels of Chlorinated Hydrocarbon in Catfish in Alabama, Arkansas, Florida, Georgia, Louisiana and Mississippi.
W73-13904 5C

Cage Culture of Black Bullheads, Ictalurus melas (Rafinesque), in North Dakota,
W73-14161 8I

CATIONS
Automated Solvent Extraction for the Determination of Trace Metals in Water by AAS (Atomic Absorption Spectrophotometry),
W73-14047 5A

CATTLE
Cattle Feedlot Pollution Study,
W73-13827 5D

Characteristics of Cattle Feedlot Surface Runoff,
W73-13833 5B

Identification of Beef Cattle Feedlot Odors,
W73-13836 5A

Confinement In Arizona
W73-13840 5D

CENSUS
A Checklist of the Fishes of the Monterey Bay Area Including Elkhorn Slough, The San Lorenzo, Pajaro and Salinas Rivers,
W73-14101 2L

CERIUM-ARSENITE REACTION
Anticatalytic Microdetermination of Mercury Using Cerium-Arsenite Reaction,
W73-14200 5A

CERTIFICATION
Career Development Guide for Wastewater Facility Personnel,
W73-14092 5G

CESIUM
Radiocesium Retention by Rainbow Trout as Affected by Temperature and Weight,
W73-13913 5C

CHAD
Biology of the Crustaceans of Lake Chad: II. Diet of the Planktonic Entomostraca,
W73-13796 2H

CHANCE-CONSTRAINED PROGRAMMING
Conditional Chance-Constrained Model for Reservoir Control,
W73-13700 4A

Designing Reservoir Control Policies with Chance Constrained Programming,
W73-14175 6A

CHANNEL CATFISH
Food Habits and Growth of Channel Catfish Fry, Ictalurus punctatus,
W73-13855 8I

CHANNELS
A Case of Planned Percolation of Liquid From Two Parallel Channels,
W73-13694 8B

CHEMICAL ANALYSIS
Environmental Applications of Advanced Instrumental Analyses: Assistance Projects, FY 69-71,
W73-13662 5A

Chemical and Physical Characteristics of Water in Estuaries of Texas, October 1969-September 1970,
W73-13679 2L

Bioassay and Chemical Composition of Some Carpathian Rivers,
W73-13734 5C

Bacteriological Procedures for Analyzing Wet and Dried Poultry Feces,
W73-13841 5A

Physico-Chemical Characteristics of the Municipal Waste Waters of the Great Montreal Area (Quebec) (Caracteristiques physico-chimiques des effluents urbains de l'agglomeration de Montreal (Quebec)),
W73-13991 5B

Chemical and Spectrochemical Analyses of Selected Ground Water in Colorado,
W73-14102 2F

Major Inorganics,
W73-14189 5A

Trace Inorganics,
W73-14190 5A

CHEMICAL COMPOSITION
Extractable Lipids of Gram-Negative Marine Bacteria: Phospholipid Composition,
W73-14066 5C

Effect of the Chemical Composition of the Medium on the Growth of Chlorella pyrenoidosa,
W73-14076 5C

CHEMICAL REACTIONS
Anticatalytic Microdetermination of Mercury Using Cerium-Arsenite Reaction,
W73-14200 5A

CHEMICAL REACTORS
The Attisholz Experimental Purification Unit (Die Attisholz-Versuchs-Reinigungs-Anlage).
W73-14030 5D

CHEMICAL RECOVERY
Tappi Environmental Conference, 1972.
W73-14050 5D

CHEMICAL TREATMENT
Treatment of Waste Water from the Cotton Processing Industry (Cisteni adpadnich vod z bavlnarskych kombinatu),
W73-14041 5D

CHEMOTAXONOMY
Extractable Lipids of Gram-Negative Marine Bacteria: Phospholipid Composition,
W73-14066 5C

Polynucleotide Sequence Relationships Among Japanese and American Strains of Vibrio Parahaemolyticus,
W73-14067 5C

CHERNOZEMS
Water Vapor Condensation in Thick Low-Humic Chernozems on the Left Bank of the Ukrainian Forest Steppe (O kondensatsii vodyanykh parov v moshchnykh malogumusnykh chernozemakh levoberezhnoy lesostepi USSR),
W73-14147 2G

CHILE
The Distribution and Life History of South American Freshwater Crabs (Aegla) and Their Role in Trout Streams and Lakes,
W73-13902 8I

CHINOOK SALMON
Expediency of Fall Chinook Salmon Acclimatization, (In Russian),
W73-14020 8I

CHLORELLA PYRENOIDOSA
Effect of the Chemical Composition of the Medium on the Growth of Chlorella pyrenoidosa,
W73-14076 5C

CHLORINATED HYDROCARBON PESTICIDES
Levels of Chlorinated Hydrocarbon in Catfish in Alabama, Arkansas, Florida, Georgia, Louisiana and Mississippi.
W73-13904 5C

CHLOROPHENYLS
Polychlorobiphenyls (PCBS) and Related Chlorophenyls: Effects on Health and Environment. I. Bibliography 1881-1971,
W73-14091 5C

CHLOROPHYTA
The Influence of Simazine on the Photosynthetic Pigments of Green Algae,
W73-13901 5C

New and Rare Species of Some Green Algae From Bangladesh,
W73-14099 5A

CHLORPYRIFOS
Laboratory Evaluation of Residues Maintained in Water Treated with Polyethylene Formulations of Chlorpyrifos, December 1971 - April 1972,
W73-14184 5A

CHROMIUM
An Investigation of Techniques for Removal of Chromium from Electroplating Wastes,
W73-13745 5D

CHRYSOPHYTA
Abnormal Shape Change by Nitzschia palea in Culture, (Abnormaler Formenwechsel von Nitzschia palea in Kultur),
W73-14074 5C

CLADOCERA
Hydrobiological Investigation of Lake Lere and Nearby Ponds: III. Cladocera and Copepoda,
W73-13795 2H

CLADOSPORIUM RESINAE
Utilization of Hydrocarbons by Cladosporium Resinae,
W73-14065 5C

CLAMS
Biota of Freshwater Ecosystems, Identification Manual No.3, Freshwater Sphaeriacean Clams (Mollusca: Pelecypoda) of North America,
W73-13738 2I

The Setting and Growth of the Manila Clam, Venerupis japonica (Deshayes), in Hood Canal, Washington,
W73-13914 8I

Soft-Shell Clam Population Study in Hampton Seabrook Harbor, New Hampshire,
W73-14151 2L

CLARIFIERS
The Attisholz Experimental Purification Unit (Die Attisholz-Versuchs-Reinigungs-Anlage).
W73-14030 5D

CLAY COUNTY (ALABAMA)
Water Availability, Clay County, Alabama,
W73-14156 7C

CLAYS
Landslides at Breckenridge, Pineview Golf Club, and Rockcliffe,
W73-13670 2J

Boron in the Clay Fraction of Bottom Sediments in The Sea of Azov (Bor v glinistoy fraktsii donnykh otlozheniy Azovskogo morya),
W73-13755 2K

CLIMATIC DATA
Water Resource Observatory, Wind Data, Water Years 1970 and 1971,
W73-13714 7C

CLOSE INTERVAL SYRINGE
A Close-Interval Syringe Sampler,
W73-13719 7B

CLOSTRIDIUM
The Selective Toxicity of Antimicrobial Nitroheterocyclic Drugs,
W73-14064 5C

CLOSTRIDIUM BOTULINUM E
Evaluation of Potential Risk of Botulism from Seafood Cocktails,
W73-14062 5C

CLOSTRIDIUM THERMOACETICUM
Fermentation of Glucose, Fructose, and Xylose by Clostridium Thermoaceticum: Effect of Metals on Growth Yield, Enzymes, and the Synthesis of Acetate from CO2,
W73-14063 5C

CLOUDS
Estimation of Average Daily Rainfall From Satellite Cloud Photographs,
W73-13750 2B

COAGULATION
The 'Cikloflok' Water Purification Process (A Cikloflok viztisztito eljaras),
W73-14012 5F

COAL MINE WASTES
Analysis of Coal Refuse Dam Failure, Middle Fork Buffalo Creek, Saunders, West Virginia.
W73-14163 8A

COAL MINES
Strip Mining, An Annotated Bibliography,
W73-13709 5B

COARSE SEDIMENTS
Interaction and the Suspension of Coarse Particles in a High-Concentration Flow,
W73-13695 8B

COASTAL STRUCTURES
Wave Forces on Pile Including Diffraction and Viscous Effects,
W73-13963 8B

COASTAL ZONE MANAGEMENT
The Dimensions of Coastal Zone Management.
W73-13858 6E

A Bill to be Entitled an Act Defining and Relating to the Management and Protection of Inland and Coastal Wetlands.
W73-13874 6E

COASTAL ZONES
Ecological Concept of the Coastal Zone in the Great Lakes,
W73-14193 5B

COASTS
Sediment Transport in a Tidal Inlet,
W73-13671 2L

California Coast Nearshore Processes Study, ERTS-A Experiment No. 088,
W73-13681 2L

Maps Showing Areas of Potential Inuncation by Tsunamis in the San Francisco Bay Region, California,
W73-13682 7C

The Dimensions of Coastal Zone Management.
W73-13858 6E

A Bill to Amend the Federal Water Pollution Control Act in Order to Require the Approval of Adjacent Coastal States Prior to the Construction of Certain Offshore Facilities.
W73-13870 6E

COLD RESISTANCE
Sensitivity of Vibrio parahaemolyticus to Cold in Oysters, Fish Fillets and Crabmeat,
W73-14072 5C

COLEOPTERA
Biota of Freshwater Ecosystems, Identification Manual No. 6, Aquatic Dryopoid Beetles (Coleoptera) of the United States,
W73-13741 2I

Comparative Studies on the Dependence of Aquatic Coleoptera to Their Environment in the Area of Neuss,
W73-14005 2I

COLOR
Quality Goals for Potable Water.
W73-13785 5G

Recycling Caustic Stage Extraction Water in Bleaching,
W73-14014 5D

Color of Pulp Industry Waste Liquors. II. Auxochromes and Chromophores in Chlorine-Oxylignin (In Japanese).
W73-14028 5B

New Lime Process for Removal of Color From Kraft Mill Effluent at Georgia-Pacific Woodland, Maine, Mill,
W73-14053 5D

COLORADO
Urban Storm Drainage and Flood Control in the Denver Region--Final Report.
W73-13677 4A

Storm Drainage and Flood Control Criteria: Objectives, Premises, Principles, Standards.
W73-13760 4A

Radiocesium Retention by Rainbow Trout as Affected by Temperature and Weight,
W73-13913 5C

Chemical and Spectrochemical Analyses of Selected Ground Water in Colorado,
W73-14102 2F

COLORIMETRY
Adaptation of the TTC Test to the Study of Dehydrogenase Activity of Activated Sludge used for the Purification of Pulp Mill Effluents (Przystosowanie testu TTC do badania aktywnosci dehydrogenaz osadow czynnych oczyszczajacych sciek i pocelulozowe),
W73-14038 5D

COLUMBIA RIVER
Canadian-United States Development of the Columbia River as Related to Arrangements for Power Development in the U. S. Pacific Northwest,
W73-13944 6E

Open-File Maps Showing Altitudes in Shallow Gravel Aquifers in March 1973, in Columbia Basin Irrigation Project Area, Washington,
W73-14108 7C

Relations Among Radionuclide Content and Physical, Chemical, and Mineral Characteristics of Columbia River Sediments,
W73-14114 5A

COLUMBIA RIVER BASIN IRRIGATION PROJECT
Open-File Maps Showing Altitudes in Shallow Gravel Aquifers in March 1973, in Columbia Basin Irrigation Project Area, Washington,
W73-14108 7C

COLUMBIA RIVER TREATY
Canadian-United States Development of the Columbia River as Related to Arrangements for Power Development in the U. S. Pacific Northwest,
W73-13944 6E

COMBINED TREATMENT
Combined Treatment of Municipal Wastewater and Acid Mine Drainage,
W73-13656 5D

COMETABOLISM
Effect of Nutrient Additions on the Apparent Cometabolism of DDT,
W73-14196 5C

COMMERCIAL SHELLFISH
Alternatives for A New Shrimp Law in Louisiana,
W73-14107 6E

COMMON LAW
United States Ex Rel. Scott V. United States Steel Corp. (Action to Restrain Steel Company from Discharging Waste Water into Lake Michigan).
W73-13876 6E

COMPENSATION
Oil Pollution and the Brussels Convention,
W73-13866 5G

COMPREHENSIVE PLANNING
Multiobjective Screening Models and Water Resource Investment,
W73-13704 6A

Storm Drainage and Flood Control Criteria: Objectives, Premises, Principles, Standards.
W73-13760 4A

A Discussion of Planning Procedure in Terms of the OECD Nine Basic Water Management Problems,
W73-13936 6E

Institutional Arrangements for the Great Lakes Basin,
W73-13938 6E

The Canada Centre for Inland Waters: An Approach to Research Co-Ordination,
W73-13942 6E

The Regional Development Approach for Managing Water in Spain,
W73-13945 6E

The German General Water Scheme as a Means for Integrating Decision Making Information,
W73-13957 6E

COMPRENSIVE PLANNING
Urban Storm Drainage and Flood Control in the Denver Region--Final Report.
W73-13677 4A

COMPUTER MODELS
Computer Studies of Estuary Water Quality,
W73-13907 5B

COMPUTER PROGRAMS
Contamination of Discharge Well From Recharge Well,
W73-13962 5B

Irrotational Flow With Irregular Boundary Shapes,
W73-13964 8B

Intuition, Policy and Mathematical Simulation
W73-14178 6A

COMPUTERS
Minicomputer for Regulation and Control of Effluent Discharges (Minidator for styrning och kontroll av avlopp),
W73-14022 5G

CONCRETIONS
Patterns of Change in Chemical Composition of Iron-Manganese Concretions in Sediments of the Northwestern Part of the Pacific Ocean (Zakonomernosti izmeneniya khimicheskogo sostava zhelezo-margantsevykh konkretsiy v osadkakh severo-z apadnoy chasti Tikhogo okeana),
W73-13688 2J

Iron Sulfide Concretions in Bottom Sediments of Lake Baykal (Konkretsii sul'fidov zheleza v donnykh osadkakh Baykala),
W73-13753 2J

CONDEMNATION
A Bill to Terminate and to Direct the Secretary of the Interior and the Secretary of the Navy to Take Action with Respect to Certain Leases Issued Pursuant to the Outer Continental Shelf Lands Act.
W73-13869 6E

CONDENSATION
Water Vapor Condensation in Thick Low-Humic Chernozems on the Left Bank of the Ukrainian Forest Steppe (O kondensatsii vodyanykh parov v moshchnykh malogumusnykh chernozemakh levoberezhnoy lesostepi USSR),
W73-14147 2G

CONFERENCE
Groundwater Distribution, Karst, and Mudflows in the Carpathian Zone (Zakonomernosti raspredeleniya podzemnykh vod, karst i seli Karpatskoy zony),
W73-14143 2F

CONFERENCES
Water Management--Basic Issues.
W73-13916 6E

Statement,
W73-13917 6E

Statement,
W73-13918 6E

Regional Workshop on Water Resources, Environment, and National Development.
W73-13966 5G

Tappi Environmental Conference, 1972.
W73-14050 5D

CONFINEMENT PENS
Confinement. In Arizona.
W73-13840 5D

Odor Control May be a Big Concern,
W73-13844 5D

CONGRESSIONAL HEARINGS
Deep Water Ports.
W73-13868 6E

CONNECTICUT
Hydrogeologic Data for the Quinnipiac River Basin, Connecticut,
W73-14112 7C

CONSERVATION
Periwinkle Creek RC and D Project Measure, Upper Willamette RC and D Project, Oregon (Final Environmental Statement).
W73-14106 4A

CONSTRUCTION COSTS
'Horizontal' Wells,
W73-13997 4B

Construction and Use of an Inexpensive Rain Gauge,
W73-14003 7B

CONSUMPTIVE USE
Price Elasticity of Demand for Municipal Water: A Case Study of Tucson, Arizona,
W73-13698 6D

Efficiency of Water Use and Associated Characteristics of Lehmann Lovegrass,
W73-13999 4A

Our Water -- A Problem Concerning the State, Industry and Citizens (Unser Wasser -- ein Problem, das Staat, Industrie und Buerger betrifft).
W73-14049 6D

CONTAMINATION
Salmonella in the Laying Hen. I. Salmonella Recovery from Viscera, Feces and Eggs Following Oral Inoculation,
W73-13852 5B

CONTROL POLICIES
Conditional Chance-Constrained Model for Reservoir Control,
W73-13700 4A

CONTROL SYSTEMS
Handbook for Analytical Quality Control in Water and Waste water Laboratories.
W73-13790 5A

Minicomputer for Regulation and Control of Effluent Discharges (Minidator for styrning och kontroll av avlopp),
W73-14022 5G

CONTROLLED ENVIRONMENT
Salmon That Need Never See the Sea,
W73-13842 5D

COOK INLET (ALAS)
Effect of Waste Discharges into A Silt-Laden Estuary, A Case Study of Cook Inlet, Alaska,
W73-13815 5C

COPEPODA
Hydrobiological Investigation of Lake Lere and Nearby Ponds: III. Cladocera and Copepoda,
W73-13795 2H

COPEPODS
The Role of Organic Debris and Associated Microorganisms in Pelagic Estuarine Food Chains,
W73-13980 5C

CORE SOUND (NC)
Overwintering Pink Shrimp, Penaeus duorarum, in Core and Pamlico Sounds, N.C.,
W73-14104 2L

CORRELATION ANALYSIS
Correlation Between Dissolved Oxygen and Phytoplankton in the Lower Reaches of Volta Lake, Ghana,
W73-13735 5C

COST ALLOCATION
German Approaches to Paying Costs of Water Management Programmes,
W73-13958 6E

Financing Costs of Water Pollution Control in Sweden,
W73-13959

COST ANALYSIS
Conventional and Unconventional Alternatives for Water Supply Management,
W73-13701 4A

COST MINIMIZATION
An Approach to Formulating Strategies for Flood Frequency Analysis,
W73-14168 6A

COST SHARING
German Approaches to Paying Costs of Water Management Programmes,
W73-13958 6E

Financing Costs of Water Pollution Control in Sweden,
W73-13959

COSTS
Treated Water Storage for Design Capacity Reduction,
W73-13967 5G

Construction and Use of an Inexpensive Rain Gauge,
W73-14003 7B

COTTON
Treatment of Waste Water from the Cotton Processing Industry (Cisteni adpadnich vod z bavlnarskych kombinatu),
W73-14041 5D

CRABS (FRESHWATER)
The Distribution and Life History of South American Freshwater Crabs (Aegla) and Their Role in Trout Streams and Lakes,

Saprobic Successions,
W73-13724 5C

DEHYDRATION
Bacteriological Procedures for Analyzing Wet and Dried Poultry Feces,
W73-13841 5A

DELAWARE
Estimation of Estuarine Marsh Productivity,
W73-14199 5B

DELAWARE RIVER
Inventory and Evaluation of Information on Delaware Bay, Volume 3,
W73-13697 2L

DELAWARE RIVER BASIN COMMISSION
The Work of the Delaware River Basin Commission,
W73-13932 6E

DEMINERALIZATION
Water Supply and Treatment in Two Regions of Saudi Arabia,
W73-13995 5F

Nitrate Removal by Ion Exchange,
W73-14008 5D

DENVER
Storm Drainage and Flood Control Criteria: Objectives, Premises, Principles, Standards.
W73-13760 4A

DENVER (COLO)
Urban Storm Drainage and Flood Control in the Denver Region--Final Report.
W73-13677 4A

DEPARTMENT OF AGRICULTURE
Planning and Implementation of Water and Related Land Resource Developments of the United States Department of Agriculture,
W73-13923 6E

DEPOSITION (SEDIMENTS)
Radioactivity of Caspian Sea Sediments and Their Deposition Rate (Radioaktivnost' i skorost' obrazovaniya osadkov Kaspiyskogo morya),
W73-13752 2J

DESALINATION
Interface Condensation Desalination Membranes,
W73-13973 3A

DESALINATION PLANTS
Water Supply and Treatment in Two Regions of Saudi Arabia,
W73-13995 5F

DESERT PLANTS (TREES)
Water and Photosynthesis Relations of Desert Plants in the Mauritanian Sahara: II. Alternating-Green, Switch-Branched and Stem-Succulent Trees,
W73-13801 2I

DESIGN
Combined Treatment of Municipal Wastewater and Acid Mine Drainage,
W73-13656 5D

Marginal Economics Applied to Pipeline Design,
W73-13969 4A

Disc Storage for Minicomputer Applications,
W73-14079 7C

Uncertainties in Hydraulic Models,
W73-14167 6A

SIGN CAPACITY
Created Water Storage for Design Capacity Reduction,
W73-13967 5G

SIGN CRITERIA
Analysis of Data from Instrumentation Program, Old River Lock,
W73-13678 8A

SIGN DATA
Construction and Use of an Inexpensive Rain Gauge,
W73-14003 7B

SIGN FLOOD
An Approach to Formulating Strategies for Flood Frequency Analysis,
W73-14168 6A

SULFOVIBRIO VULGARIS
pH and Eh Control of Cultures of Sulphate-Reducing Bacteria,
W73-14191 5C

TRITUS
The Role of Organic Debris and Associated Microorganisms in Pelagic Estuarine Food Chains,
W73-13980 5C

Transfer of CS-137 From Detritus to Primary Producer,
W73-14183 5B

WATERING
Optimal Procedures for the Processing of Waste Activated Sludge,
W73-13982 5D

Vari-Nip Press Sludge Dewatering at Container Corporation of America, Fernandina Beach, Florida,
W73-14055 5E

TOMS
Observations on the Structure of Some Forms of Gomphonema Parvulum Kutz. II. The Internal Organization,
W73-14187 5C

Continuous Culture of Marine Diatoms Under Silicate Limitation. I. Synchronized Life Cycle of Skeletonema Costatum,
W73-14188 5C

FUSERS
Volume Temperature Measurements of Shallow, Submerged Model Discharges with Current,
W73-13821 5B

FUSION
The Influence of Suspended Sediment on the Surface Reaeration of Uniform Streams,
W73-13817 2J

GITAL COMPUTERS
Disc Storage for Minicomputer Applications,
W73-14079 7C

Predicting Crosstalk in Digital Systems,
W73-14080 7C

DIMETHYL MERCURY
Ecological Implications of Dimethyl Mercury in an Aquatic Food Chain,
W73-13657 5C

DISCHARGE COEFFICIENTS
Model Test of Box Inlet Drop Spillway and Stilling Basin Proposed for Tillatoba Creek, Tallahatchie County, Miss.,
W73-13781 8B

DISCHARGE (WATER)
Minicomputer for Regulation and Control of Effluent Discharges (Minidator for styrning och kontroll av avlopp),
W73-14022 5G

DISINFECTION
Bacterial Decontamination of Effluents (Bakteritsidnoe obezzarazhivaniestokov),
W73-14033 5D

DISK DRIVES
Disc Storage for Minicomputer Applications,
W73-14079 7C

DISSOLVED OXYGEN
Aeration of Natural Waters, A Bibliography.
W73-13651 5G

Correlation Between Dissolved Oxygen and Phytoplankton in the Lower Reaches of Volta Lake, Ghana,
W73-13735 5C

Uncertainties in Water Quality Modeling: The Case of Atmospheric Reaeration,
W73-14169 5G

DISSOLVED SOLIDS
Geochemistry of the Ganga River Water,
W73-14120 2K

DISTRIBUTION PATTERNS
Determination of the Confidence Intervals of the Pearson III Law Using Order Statistics (Determination des intervalles de confiance de la loi Pearson III par les statistiques d'ordre),
W73-13989 7A

Extent of the Pearson III Law: The Case of Negative Skewness (Extension de la loi Pearson III: le cas de l'asymetrie negative),
W73-13990 7A

DISTRICT OF COLUMBIA
Conventional and Unconventional Alternatives for Water Supply Management,
W73-13701 4A

DNA
Polynucleotide Sequence Relationships Among Japanese and American Strains of Vibrio Parahaemolyticus,
W73-14067 5C

DNIEPER RIVER (USSR)
Biological Transformation of Organic Matter in a River,
W73-13727 5C

Experience in the Study of Bottom Associations in the Dnieper River Reservoirs and their Productivity,
W73-13729 5C

DOCUMENTATION
Inventory and Evaluation of Information on Delaware Bay, Volume 3,
W73-13697 2L

Polychlorobiphenyls (PCBS) and Related Chlorophenyls: Effects on Health and Environment. I. Bibliography 1881-1971,
W73-14091 5C

DOMINANT ORGANISMS
A Probabilistic Approach to the Dynamics of Natural Populations of the Chydoridae (Cladocera, Crustacea),
W73-14057 2H

DRAG
Wave Forces on Pile Including Diffraction and Viscous Effects,
W73-13963 8B

DRAINAGE
Design of Systematic Drainage with Evaporation and Transpiration,
W73-13693 2D

Rights of Way--Obstructions--Crossings--Connections.
W73-13886 6E

DRAINAGE DISTRICTS
Jurisdiction over Various Drains and Exemptions.
W73-13885 6E

South County Drainage District V. Brevard County (Appeal by Drainage District from Judgment Denying District's Prayer for Permission to Amend Its Plan of Reclamation).
W73-13892 6E

DRAINAGE EFFECTS
Role of Depth and Quality of Watertable on Soil Salinization,
W73-14122 2G

DRAINS
Jurisdiction over Various Drains and Exemptions.
W73-13885 6E

Rights of Way--Obstructions--Crossings--Connections.
W73-13886 6E

DRAWDOWN
Overwinter Drawdown: Impact on the Aquatic Vegetation in Murphy Flowage, Wisconsin,
W73-13723 5C

DREDGING
Review of Some Direct Effects of Spoil Dumping on Marine Animals,
W73-13782 5C

Effects of Spoil Dumping on the Benthic Invertebrates of the Sound,
W73-13783 5C

Fisheries Resources in the Dump Site Area,
W73-13784 5C

DROPS (FLUIDS)
Estimate of the Content of Spray Drops in the Near-Water Layer of the Atmosphere,
W73-13690 2B

Use of the Electron Microscope Hydration Chamber to Study Small Water Drops,
W73-14024 2B

DROPS (STRUCTURES)
Model Test of Box Inlet Drop Spillway and Stilling Basin Proposed for Tillatoba Creek, Tallahatchie County, Miss.,
W73-13781 8B

DROUGHT
Effect of Wilting and Soil Drought on Endogenous Growth Regulators of Mesophyte Plants, (In Russian),
W73-14021 3F

DRYOPOIDEA
Biota of Freshwater Ecosystems, Identification Manual No. 6, Aquatic Dryopoid Beetles (Coleoptera) of the United States,
W73-13741 2I

DUNES
Determination of Kennedy's Parameter for Dunes,
W73-13961 2J

DYE RELEASES
Trinity Bay Study: Dye Tracing Experiments,
W73-14164 5B

DYSTROPHY
Nutrient Cycling and Productivity of Dystrophic Lake-BOG Systems (Part A),
W73-14185 5C

E. COLI
Oxygen Toxicity and the Superoxide Dismutase,
W73-14069 5C

Interactions of Tetrahymena pyriformis, Escherichia coli, Azotobacter vinelandii, and Glucose in a Minimal Medium,
W73-14095 5C

EARTHQUAKES
Tsunami Waves (Volny tsunami).
W73-13751 2L

EASTERN BROOKS RANGE (ALASKA)
Hydrologic Reconnaissance of Streams and Springs in Eastern Brooks Range, Alaska--July 1972,
W73-13759 2E

EASTERN PALM BEACH COUNTY (FLA)
Appraisal of the Water Resources of Eastern Palm Beach County, Florida,
W73-13675 2E

ECOLOGICAL EFFECTS
Evaluation of Ecological Effects of Recent Low Water Levels in the Peace-Athabasca Delta,
W73-13775 5C

ECOLOGICAL STUDIES
Contribution to the Knowledge of the Forest Associations of the Lesser Carpathians, Slovakia: 2. Habitat Conditions,
W73-14192 2I

ECOLOGY
River Ecology and Man. Proceedings of an International Symposium.
W73-13791 6G

Taxonomy and Ecology of Three New Species of Monodiamsa Kieffer, with Keys to Nearctic and Palaearctic Species of the Genus (Diptera: Chironomidae),
W73-14084 5A

Ecological Concept of the Coastal Zone in the Great Lakes,
W73-14193 5B

ECONOMIC ANALYSIS
Treated Water Storage for Design Capacity Reduction,
W73-13967 5G

Optimizing the Supply of Inland Water Transport,
W73-13968 4A

ECONOMIC IMPACT
The Impact of Reservoir Recreation on the Whitney Point Microregion of New York State,
W73-13661 6B

ECONOMICS
Economics of Water Pollution Control,
W73-13837 5G

Marginal Economics Applied to Pipeline Design,
W73-13969 4A

ECOSYSTEMS
Experience in the Study of Bottom Associations in the Dnieper River Reservoirs and their Productivity,
W73-13729 5C

Energy Fixation and Precipitation-Use Efficiency in a Fertilized Rangeland Ecosystem of the Northern Great Plains,
W73-14002 2I

Ecological Concept of the Coastal Zone in the Great Lakes,
W73-14193 5B

EDUCATION
Biennial Report, Institute of Water Resources, University of Alaska, 1972.
W73-13652 9D

Waste Water Treatment Facilities, Training Manual.
W73-13672 5D

EFFLUENT
Oxidation Ditch is Cattle Feed Source.
W73-13847 5D

EFFLUENT LIMITATION
An Examination of the Federal Water Pollution Control Act Amendments of 1972,
W73-13865 5G

EGYPT (NILE DELTA)
Effect of River Outflow Management on Marine Life,
W73-14018 2L

ELASTICITY OF DEMAND
Price Elasticity of Demand for Municipal Water: A Case Study of Tucson, Arizona,
W73-13698 6D

ELECTRIC POWER INDUSTRY
Forecasting Water Use for Electric Power Generation,
W73-13705 6D

ELECTRIC POWERPLANTS
Remote Sensing Study of Thermal Discharges to Lake Michigan, Illinois--Indiana-Michigan.
W73-13747 5B

ELECTRICAL WELL LOGGING
Study of the Quality of Formation Waters from Electric Logs in the Salt Area, Calcutta,
W73-14117 2K

ELECTRODIALYSIS
Use of Electrodialysis for Processing Spent Sulfite Liquors (Ispol'zovaniye elektrodializa dlya pererabotki sul'fitnykh shchelokov),
W73-14034 5D

ELECTRON MICROSCOPY
Use of the Electron Microscope Hydration Chamber to Study Small Water Drops.
W73-14024 2B

Observations on the Structure of Some Forms of Gomphonema Parvulum Kutz. II. The Internal Organization,
W73-14187 5C

ELECTROPLATING WASTES
An Investigation of Techniques for Removal of Chromium from Electroplating Wastes,
W73-13745 5D

EMINENT DOMAIN
Reservoir Sites for Storage of Water
W73-13884 6E

ENERGY BALANCE
Elements of Energy Balance in Grass Carp (Ctenopharyngodon idella Val.) III Assimilability of Proteins, Carbohydrates, and Lipids by Fish Fed with Plant and Animal Food,
W73-13797 2I

ENERGY BUDGET
Energy Fixation and Precipitation-Use Efficiency in a Fertilized Rangeland Ecosystem of the Northern Great Plains,
W73-14002 2I

ENERGY TRANSFER
Biological Transformation of Organic Matter in a River,
W73-13727 5C

ENGINEERING STRUCTURES
Analysis of Data from Instrumentation Program, Old River Lock,
W73-13678 8A

ENTOMOSTRACA
Biology of the Crustaceans of Lake Chad: II. Diet of the Planktonic Entomostraca,
W73-13796 2H

ENTROPY
Entropy in the Assessment of Uncertainty in Hydrologic Systems Behavior and in Mathematical Model Performance,
W73-14170 6A

ENVIRONMENT
Environmental Pollution by Potassium Plant Wastes (Zagryazneniye okruzhayushchey sredy otkhodami kaliynogo proizvodstva),
W73-14148 5C

ENVIRONMENTAL CONTROL
Regional Workshop on Water Resources, Environment, and National Development.
W73-13966 5G

Institutional Implications of U.S. Deepwater Port Development for Crude Oil Imports,
W73-13987 8A

Periwinkle Creek RC and D Project Measure, Upper Willamette RC and D Project, Oregon (Final Environmental Statement).
W73-14106 4A

ENVIRONMENTAL EFFECTS
Influence of Man on the Hydrological Cycle: Guidelines to Policies for the Safe Development of Land and Water Resources.
W73-13767 2A

Ecological Effects of Strip Mining in Ohio,
W73-13780 5C

Effects of Spoil Dumping on the Benthic Invertebrates of the Sound,
W73-13783 5C

Sewage Sludge Incorporation in Experimental Field Plots to Evaluate Hazards and Benefits, and Develop Techniques for Optimizing Benefits and Minimize Hazards (Final Environmental Statement).
W73-13860 5D

Boomer Creek Channel Improvement (Local Flood Protection Project), Stillwater, Oklahoma, (Final Environmental Statement).
W73-13861 4A

Preparation of Environmental Impact Statements--Proposed Guidelines, Part II.
W73-13873 6E

Pipelines and Trout Water,
W73-14048 4C

Extractable Lipids of Gram-Negative Marine Bacteria: Phospholipid Composition,
W73-14066 5C

NVIRONMENTAL ENGINEERING
Treated Water Storage for Design Capacity Reduction,
W73-13967 5G

NVIRONMENTAL GUIDELINES
Preparation of Environmental Impact Statements--Proposed Guidelines, Part II.
W73-13873 6E

NVIRONMENTAL IMPACT STATEMENTS
Hamlin Beach State Park Cooperative Beach Erosion Control Project, Lake Ontario, Monroe County, New York (Final Environmental Impact Statement).
W73-13746 8D

Final Environmental Impact Statement, Sope Creek Drainage Area, Cobb County, Georgia--Amendment to Environmental Impact Statement, Cobb County Sewerage Improvement Project, July 1971.
W73-13764 5D

Sewage Sludge Incorporation in Experimental Field Plots to Evaluate Hazards and Benefits, and Develop Techniques for Optimizing Benefits and Minimize Hazards (Final Environmental Statement).
W73-13860 5D

Boomer Creek Channel Improvement (Local Flood Protection Project), Stillwater, Oklahoma, (Final Environmental Statement).
W73-13861 4A

Preparation of Environmental Impact Statements--Proposed Guidelines, Part II.
W73-13873 6E

Molokai Homesteaders Cooperative Ass'n. V. Morton (Action for Preliminary Injunction to Prevent Board of Land and Natural Resources From Entering into Agreement with Corporation for Use of Pipeline).
W73-13899 6E

Periwinkle Creek RC and D Project Measure, Upper Willamette RC and D Project, Oregon (Final Environmental Statement).
W73-14106 4A

ENVIRONMENTAL INDICES
Investigation of Environmental Indices from the Earth Resources Technology Satellite, PR 568/MMC 200,
W73-14162 5A

ENVIRONMENTAL POLICY
Intuition, Policy and Mathematical Simulation,
W73-14178 6A

ENZYMES
Fermentation of Glucose, Fructose, and Xylose by Clostridium Thermoaceticum: Effect of Metals on Growth Yield, Enzymes, and the Synthesis of Acetate from CO2,
W73-14063 5C

EQUATIONS
Predicting Crosstalk in Digital Systems,
W73-14080 7C

EROSION
Soil Erosion and Transport of Solids by Streams, (Erosion du sol et transports solides des cours d'eau).
W73-13768 2A

EROSION CONTROL
Depositional Behavior of Cohesive Sediments,
W73-13669 2L

Hamlin Beach State Park Cooperative Beach Erosion Control Project, Lake Ontario, Monroe County, New York (Final Environmental Impact Statement).
W73-13746 8D

ERTS
Symposium on Significant Results Obtained from Earth Resources Technology Satellite-1, March 5-9, 1973, Volume II Summary of Results.
W73-14126 7B

Review of ERTS-1 Status,
W73-14127 7B

Identification and Mapping of Soils, Vegetation, and Water Resources of Lynn County, Texas, by Computer Analysis of ERTS MSS Data,
W73-14128 7B

Preliminary Geologic Application of ERTS-1 Imagery in Alaska,
W73-14129 7B

A Multidisciplinary Survey for the Management of Alaskan Resources Utilizing ERTS Imagery,
W73-14130 7B

Application of ERTS-1 Imagery to Flood Inundation Mapping,
W73-14131 7B

Agriculture, Forestry and Rangeland Resources,
W73-14132 7B

Land Use and Mapping,
W73-14133 7B

Mineral Resources, Geologic Structure, and Landform Surveys,
W73-14134 7B

Water Resources,
W73-14135 7B

The Earth Resources Program of the Corps of Engineers,
W73-14136 7B

Application of ERTS-1 Data to Aid in Solving Water Resources Management Problems in the State of California,
W73-14137 7B

Application of ERTS Results to Land and Resource Management in the State of Mississippi,
W73-14138 7B

Investigation of Environmental Indices from the Earth Resources Technology Satellite, PR 568/MMC 200,
W73-14162 5A

ERTS IMAGERY
Land Use Classification Using Texture Information in ERTS-A MSS Imagery,
W73-13685 7B

ESSENTIAL NUTRIENTS
Nitrate Reduction and the Growth of Veillonella Alcalescens,
W73-14070 5B

Abnormal Shape Change by Nitzschia palea in Culture, (Abnormaler Formenwechsel von Nitzschia palea in Kultur),
W73-14074 5C

ESTIMATING
Forecasting Water Use for Policy Making: A Review,
W73-13706 6D

Estimation of Estuarine Marsh Productivity,
W73-14199 5B

ESTUARIES
Chemical and Physical Characteristics of Water in Estuaries of Texas, October 1969-September 1970,
W73-13679 2L

California Coast Nearshore Processes Study, ERTS-A Experiment No. 088,
W73-13681 2L

Effect of Waste Discharges into A Silt-Laden Estuary, A Case Study of Cook Inlet, Alaska,
W73-13815 5C

The Wetlands Statutes: Regulation or Taking,
W73-13859 5G

Computer Studies of Estuary Water Quality,
W73-13907 5B

The Role of Organic Debris and Associated Microorganisms in Pelagic Estuarine Food Chains,
W73-13980 5C

Transport and Deposition of Sediments in Estuaries,
W73-14149 2L

ESTUARINE ENVIRONMENT
Estimation of Estuarine Marsh Productivity,
W73-14199 5B

ETHANOL
Methanol, Ethanol, and Acetone in Kraft Pulp Mill Condensate Streams,
W73-14019 5B

ETHYLENETHIOUREA
Photolysis of Ethylenethiourea,
W73-14194 5C

EUGENE-SPRINGFIELD AREA (ORE)
Ground Water in the Eugene-Springfield Area, Southern Willamette Valley, Oregon,
W73-14113 2F

EUGLENA GRACILIS
Molybdenum Toxicity: Abnormal Cellular Division of Teratogenic Appearance in Euglena Gracilis,
W73-14197 5C

EUTROPHIC ACTION
An Investigation of the Cause and Effect of Eutrophication in Long Lake, Washington,
W73-13658 5C

EUTROPHICATION
Some Effects of Mysid Introduction and Nutrient Enrichment on a Large Oligotrophic Lake and Its Salmonids,
W73-13776 5C

On the Use of Material Balances for the Assessment of Self-Purification Capacity in Inland Waters, Lake Paijanne as an Example,
W73-13779 5C

Nutrient Inputs and Their Relationship to Accelerated Eutrophication in Lake Michigan,
W73-13905 5C

EVALUATION
Evaluation of Potential Risk of Botulism from Seafood Cocktails,
W73-14062 5C

EVAPORATION
Heat and Water Vapor Exchange Between Water Surface and Atmosphere,
W73-13663 2D

Design of Systematic Drainage with Evaporation and Transpiration,
W73-13693 2D

Actual Potential and Equilibrium Evaporation for a Bean Field in Southern Ontario,
W73-13721 2D

EXPERIMENTS
Some Current Problems of Rain Stimulation Research,
W73-14179 3B

EXTRACTION
Activated Sludge as a Source of Protein,
W73-13832 5D

FABRICATION
Selective Potassium-Sensitive Electrodes Based on Potassium Tetra-P-Chlorophenylborate-Poly (Vinyl Chloride) Sensor Membranes,
W73-14075 5A

A Simple, Off-Line Mass Spectra Digitizer,
W73-14093 7C

FARM MANAGEMENT
Confinement. In Arizona.
W73-13840 5D

FARM PRACTICES
Animal Waste Disposal,
W73-13829 5G

FARM WASTES
Pollution Loads in Percolate Water from Surface Spread Swine Wastes,
W73-13822 5B

Methods of Swine Manure Disposal,
W73-13824 5D

A Feeder Looks at Animal Waste Disposal,
W73-13826 5E

Cattle Feedlot Pollution Study,
W73-13827 5D

Animal Waste Disposal,
W73-13829 5G

Disposal of Beef Feedlot Wastes Onto Cropland,
W73-13830 5E

Seepage Losses and Fertilizer Preservation in Manure Stacking Practice,
W73-13831 5G

Move to New Location Solves Many Problems for Custom Feeder,
W73-13835 5G

Identification of Beef Cattle Feedlot Odors,
W73-13836 5A

Agricultural Wastes--A Management Problem,
W73-13838 5B

Animal Waste Management in Hawaii,
W73-13839 5D

Confinement. In Arizona.
W73-13840 5D

Bacteriological Procedures for Analyzing Wet and Dried Poultry Feces,
W73-13841 5A

The Price Tag to Stop Feedlot Run-Off,
W73-13843 5D

Odor Control May be a Big Concern,
W73-13844 5D

Liquid Waste Seeps From One Basin to Another.
W73-13845 5D

New Odor Control Project.
W73-13846 5D

Monfort Looks at Treated Manure for Tile and Plastic.
W73-13848 5D

California Waste Ponds Are Passing the Test,
W73-13849 5D

How Much Manure Per Acre.
W73-13850 5G

Fly Control and Chronic Toxicity from Feeding Dursban (0,0-Diethyl 0-3, 5, 6-Trichloro-2-Pyridyl Phosphorothioate) to Laying Hens,
W73-13851 5G

Salmonella in the Laying Hen. I. Salmonella Recovery from Viscera, Feces and Eggs Following Oral Inoculation,
W73-13852 5B

FARMS
Identification and Mapping of Soils, Vegetation, and Water Resources of Lynn County, Texas, by Computer Analysis of ERTS MSS Data,
W73-14128 7B

FATE OF POLLUTANTS
Effect of Nutrient Additions on the Apparent Cometabolism of DDT,
W73-14196 5C

FATHEAD MINNOW
Effects of Saline Waters Upon Survival of Fish Eggs and Larvae and Upon the Ecology of the Fathead Minnow in North Dakota,
W73-13981 5C

FATHEAD MINNOWS
Ecological Implications of Dimethyl Mercury an Aquatic Food Chain,
W73-13657 5

FATTY ACIDS
The Fatty Acids of Pseudomonas multivorans (Pseudomonas cepacia) and Pseudomonas kingii,
W73-14078 5

FAUNA (HELMINTH)
Studies of the Helminth Fauna of Norway XX Seasonal Cycles of Fish Parasites in the Glomma,
W73-14007 2

FEDERAL GOVERNMENT
The Role of the United States Bureau of Reclamation in Water Management Activities,
W73-13922 6E

FEDERAL WATER POLLUTION ACT
A Bill to Amend the Federal Water Pollution Control Act.
W73-13872 6E

FEDERAL WATER POLLUTION CONTROL ACT
An Examination of the Federal Water Pollution Control Act Amendments of 1972,
W73-13865 5G

Deep Water Ports.
W73-13868 6E

A Bill to Amend the Federal Water Pollution Control Act in Order to Require the Approval of Adjacent Coastal States Prior to the Construction of Certain Offshore Facilities.
W73-13870 6E

United States Ex Rel. Scott V. United States Steel Corp. (Action to Restrain Steel Company from Discharging Waste Water into Lake Michigan).
W73-13876 6E

United States V. Rohm and Haas Company (Action to Enjoin Industrial Discharge into Houston Channel under the Refuse Act).
W73-13881 6E

United States V. Consolidation Coal Company (Injunction to Stop Defendant's Discharge of Wastes into Navigable Waters Under the Refuse Act).
W73-13882 6E

Small Town Wastewater Treatment,
W73-14046 5D

FEDERAL WATER QUALITY IMPROVEMENT ACT
State Legislation Concerning Marine Pollution from Vessels,
W73-13867 5G

FEED LOTS
Animal Waste Disposal,
W73-13825 5G

A Feeder Looks at Animal Waste Disposal,
W73-13826 5E

Cattle Feedlot Pollution Study,
W73-13827 5D

Do You Have to Move 'Em or Can you Leave 'Em,
W73-13828 5G

Disposal of Beef Feedlot Wastes Onto Cropland,
W73-13830 5E

Characteristics of Cattle Feedlot Surface Runoff,
W73-13833 5B

Move to New Location Solves Many Problems for Custom Feeder,
W73-13835 5G

Identification of Beef Cattle Feedlot Odors,
W73-13836 5A

Confinement. In Arizona.
W73-13840 5D

The Price Tag to Stop Feedlot Run-Off,
W73-13843 5D

New Odor Control Project.
W73-13846 5D

FEEDS
Oxidation Ditch is Cattle Feed Source.
W73-13847 5D

FENITROTHION
Behavior of Young Atlantic Salmon (Salmo salar) Exposed to or Force-Fed Fenitrothion, an Organophosphate Insecticide,
W73-14083 5C

FERMENTATION
Fermentation of Glucose, Fructose, and Xylose by Clostridium Thermoaceticum: Effect of Metals on Growth Yield, Enzymes, and the Synthesis of Acetate from CO2,
W73-14063 5C

FERTILITY
Persistence of Manure Phosphorus Availability in Calcareous Soil,
W73-13823 5B

FERTILIZATION
Nitrogen and Phosphorus Availability in a Fertilized Rangeland Ecosystem of the Northern Great Plains,
W73-14001 2I

FERTILIZERS
Protection of a Unique Ecological Area Through Improved Water and Fertility Management,
W73-13667 5G

A Feeder Looks at Animal Waste Disposal,
W73-13826 5E

Animal Waste Disposal,
W73-13829 5G

How Much Manure Per Acre.
W73-13850 5G

FIBER
Aquatic Plants from Minnesota Part 4 - Nutrient Composition,
W73-13716 2I

FILL PERMITS
Jefferson National Bank at Sunny Isles V. Metropolitan Dade County (Ownership of Fill Placed Beyond Bulkhead Line).
W73-13880 6E

FILM FLOW REACTORS
Biological Removal of Colloidal Matter from Wastewater,
W73-13984 5D

FILTERS
Peat in Pollution Abatement,
W73-14023 5D

Use of Mixed Media in Water Plant Filtration,
W73-14052 6D

FILTRATION
Experimental Study on the Adsorption of Polio Vaccine Virus Type 2, During Filtration Through Millipore-Membrane Filters (In German),
W73-13994 5B

The 'Cikloflok' Water Purification Process (A Cikloflok viztisztito eljaras),
W73-14012 5F

Use of Reverse Osmosis and Ultrafiltration for the Purification of Effluents (Primenenie metodov obratnogo osmosa i ul'trafil'tratsii pri ochistke stokov),
W73-14045 5D

Recycling Fine-Paper Mill Effluent by Means of Pressure Filtration,
W73-14051 5D

FINANCING
Small Town Wastewater Treatment,
W73-14046 5D

FINITE ELEMENT ANALYSIS
A Finite-Element, Planar-Flow Model of Camas Prairie, Idaho,
W73-13763 2F

FINLAND
Finnish Watercourts: An Example of a Compensation Procedure in the Lokka Artificial Lake Project,
W73-13953 6E

Status of Waste Purification in the Finnish Pulp and Paper Industry (A celuloz-es papiripari szennyviztisztitas helyete Finnorszagban),
W73-14013 5D

FINLAND (LAKE PAIJANNE)
On the Use of Material Balances for the Assessment of Self-Purification Capacity in Inland Waters, Lake Paijanne as an Example,
W73-13779 5C

FINLAND (TVARMINNE ARCHIPELAGO)
The Rotifer Fauna of Rock-Pools in the Tvarminne Archipelago, Southern Finland.
W73-14011 2I

FIRST-ORDER ANALYSIS
First-Order Analysis of Model and Parameter Uncertainty,
W73-14180 6A

FISH
Pesticide Levels in Water and Wildlife of Reelfoot Lake, Tennessee,
W73-13820 5C

Effects of Saline Waters Upon Survival of Fish Eggs and Larvae and Upon the Ecology of the Fathead Minnow in North Dakota,
W73-13981 5C

A Checklist of the Fishes of the Monterey Bay Area Including Elkhorn Slough, The San Lorenzo, Pajaro and Salinas Rivers,
W73-14101 2L

FISH BEHAVIOR
The Effects of Water Management Practices on the Movement of Largemouth Bass,
W73-13654 2I

Behavior of Young Atlantic Salmon (Salmo salar) Exposed to or Force-Fed Fenitrothion, an Organophosphate Insecticide,
W73-14083 5C

FISH CONSERVATION
Fisheries Resources in the Dump Site Area,
W73-13784 5C

Alternatives for A New Shrimp Law in Louisiana,
W73-14107 6E

FISH DISEASES
The Haematological Assessment of the Health of Freshwater Fish: A Review of Selected Literature,
W73-13813 5C

FISH ESTABLISHMENT
A Checklist of the Fishes of the Monterey Bay Area Including Elkhorn Slough, The San Lorenzo, Pajaro and Salinas Rivers,
W73-14101 2L

FISH FOOD
Elements of Energy Balance in Grass Carp (Ctenopharyngodon idella Val.): III. Assimilability of Proteins, Carbohydrates, and Lipids by Fish Fed with Plant and Animal Food,
W73-13797 2I

FISH HATCHERIES
Cage Culture of Black Bullheads, Ictalurus melas (Rafinesque), in North Dakota,
W73-14161 8I

FISH MANAGEMENT
Cage Culture of Black Bullheads, Ictalurus melas (Rafinesque), in North Dakota,
W73-14161 8I

FISH MIGRATION
The Effects of Water Management Practices on the Movement of Largemouth Bass,
W73-13654 2I

FISH PARASITES
Biota of Freshwater Ecosystems, Identification Manual No. 2, THE GENUS Argulus (CRUSTACEA; BRANCHIURA) OF THE UNITED STATES,
W73-13737 2I

FISH POPULATIONS
Soft-Shell Clam Population Study in Hampton Seabrook Harbor, New Hampshire,
W73-14151 2L

FISH REPRODUCTION
Effects of Saline Waters Upon Survival of Fish Eggs and Larvae and Upon the Ecology of the Fathead Minnow in North Dakota,
W73-13981 5C

FISH SPECIES
A Checklist of the Fishes of the Monterey Bay Area Including Elkhorn Slough, The San Lorenzo, Pajaro and Salinas Rivers,
W73-14101 2L

FISHERIES
Biogenic Enrichment of Sockeye Salmon Lakes and Stock Productivity,
W73-13777 5C

Fisheries Resources in the Dump Site Area,
W73-13784 5C

Effect of River Outflow Management on Marine Life,
W73-14018 2L

FLOCCULATION
The 'Cikloflok' Water Purification Process (A Cikloflok viztisztito eljaras),
W73-14012 5F

FLOOD CONTROL
Storm Drainage Plan Study Design.
W73-13683 4A

Storm Drainage and Flood Control Criteria: Objectives, Premises, Principles, Standards.
W73-13760 4A

Boomer Creek Channel Improvement (Local Flood Protection Project), Stillwater, Oklahoma, (Final Environmental Statement).
W73-13861 4A

Crisafulli V. State (Suit for Flood Damages Allegedly Caused by State's Failure to Open Floodgates).
W73-13890 6E

The Role of the United States Army Corps of Engineers in Water Management,
W73-13921 6E

Periwinkle Creek RC and D Project Measure, Upper Willamette RC and D Project, Oregon (Final Environmental Statement).
W73-14106 4A

FLOOD DAMAGE
Floods of December 1971 in Western Arkansas,
W73-13668 2E

Crisafulli V. State (Suit for Flood Damages Allegedly Caused by State's Failure to Open Floodgates).
W73-13890 6E

Analysis of Coal Refuse Dam Failure, Middle Fork Buffalo Creek, Saunders, West Virginia.
W73-14163 8A

FLOOD DATA
Floods of December 1971 in Western Arkansas,
W73-13668 2E

Floods of 1971 and 1972 on Glover Creek and Little River in Southeastern Oklahoma,
W73-13680 7C

Floods in Big Rock Quadrangle, Northeastern Illinois,
W73-14154 7C

FLOOD DISCHARGE
Floods of 1971 and 1972 on Glover Creek and Little River in Southeastern Oklahoma,
W73-13680 7C

FLOOD FORECASTING
Hydrologic Reconnaissance of Streams and Springs in Eastern Brooks Range, Alaska--July 1972,
W73-13759 2E

The Problem of Floods and Their Computation,
W73-13773 2A

Some Aspects of Hydrometeorology,
W73-14124 2A

FLOOD FREQUENCY
Floods of December 1971 in Western Arkansas,
W73-13668 2E

Floods in Big Rock Quadrangle, Northeastern Illinois,
W73-14154 7C

An Approach to Formulating Strategies for Flood Frequency Analysis,
W73-14168 6A

Uncertainties Resulting From Man-Made Structures,
W73-14174 8A

FLOOD IRRIGATION
Pollution Loads in Percolate Water from Surface Spread Swine Wastes,
W73-13822 5B

FLOOD MAPPING
Application of ERTS-1 Imagery to Flood Inundation Mapping,
W73-14131 7B

FLOOD PEAK
Hydrologic Reconnaissance of Streams and Springs in Eastern Brooks Range, Alaska--July 1972,
W73-13759 2E

FLOOD PROFILES
Floods of 1971 and 1972 on Glover Creek and Little River in Southeastern Oklahoma,
W73-13680 7C

Floods in Big Rock Quadrangle, Northeastern Illinois,
W73-14154 7C

FLOODS
Floods of December 1971 in Western Arkansas,
W73-13668 2E

Floods in New York--1971,
W73-13673 2E

Floods of 1971 and 1972 on Glover Creek and Little River in Southeastern Oklahoma,
W73-13680 7C

Maps Showing Areas of Potential Inuncation by Tsunamis in the San Francisco Bay Region, California,
W73-13682 7C

Application of ERTS-1 Imagery to Flood Inundation Mapping,
W73-14131 7B

Floods in Big Rock Quadrangle, Northeastern Illinois,
W73-14154 7C

FLORIDA
Appraisal of the Water Resources of Eastern Palm Beach County, Florida,
W73-13675 2E

A Bill to be Entitled an Act Defining and Relating to the Management and Protection of Inland and Coastal Wetlands.
W73-13874 6E

State V. St. Regis Paper Company (Administrative Hearing not Condition Precedent to Suit by State for Water Pollution Damages).
W73-13877 6E

Jefferson National Bank at Sunny Isles V. Metropolitan Dade County (Ownership of Fill Placed Beyond Bulkhead Line).
W73-13880 6E

South County Drainage District V. Brevard County (Appeal by Drainage District from Judgment Denying District's Prayer for Permission to Amend Its Plan of Reclamation).

FLORIDA OIL-SPILL PREVENTION AND POLLUTION CONTROL ACT
Askew V American Waterways Operators, Inc. (Constitutionality of Florida's Oil-Spill Prevention and Pollution Control Act)
W73-13879 6E

FLOTATION
Flotation of Cellulose Fibers in Alkaline Media (Otnosno flotatsiyata na tselulozni vlakna v alkalna sreda),
W73-14026 5D

New Flotation Aids for Cellulosic Fibers (Novi flotoreagenti za tselulozni vlakna),
W73-14027 5D

FLOTATION AIDS
New Flotation Aids for Cellulosic Fibers (Novi flotoreagenti za tselulozni vlakna),
W73-14027 5D

FLOW
A Case of Planned Percolation of Liquid From Two Parallel Channels,
W73-13694 8B

Interaction and the Suspension of Coarse Particles in a High-Concentration Flow,
W73-13695 8B

Calibration of Distributed Parameter Groundwater Flow Models Viewed as a Multiple-Objective Decision Process Under Uncertainty,
W73-13699 2F

FLOW CONTROL
Division of Waste Water Flow,
W73-13788 5D

FLOW RATES
Combined Sampling and Flow Measurement,
W73-13708 5A

FLOW SEPARATION
Division of Waste Water Flow,
W73-13788 5D

FLOWMETERS
Division of Waste Water Flow,
W73-13788 5D

FLUID FRICTION
Flow Augmenting Effects of Additives on Open Channel Flows,
W73-13664 5G

FLUID MECHANICS
A Case of Planned Percolation of Liquid From Two Parallel Channels,
W73-13694 8B

Interaction and the Suspension of Coarse Particles in a High-Concentration Flow,
W73-13695 8B

FLUMES
Flow Augmenting Effects of Additives on Open Channel Flows,
W73-13664 5G

FLUORESCENCE
Detection of Naturally Fluorescent Pesticides on Silica Gel Layers,
W73-14058 5A

FLUOROMETRY
Trinity Bay Study: Dye Tracing Experiments,
W73-14164 5B

FLY CONTROL
Fly Control and Chronic Toxicity from Feeding Dursban (0,0-Diethyl 0-3, 5, 6-Trichloro-2-Pyridyl Phosphorothioate) to Laying Hens,
W73-13851 5G

FOAM SEPARATION
Bacterial Decontamination of Effluents (Bakteritsidnoe obezzarazhivaniestokov),
W73-14033 5D

FOOD CHAINS
Ecological Implications of Dimethyl Mercury in an Aquatic Food Chain,
W73-13657 5C

The Role of Organic Debris and Associated Microorganisms in Pelagic Estuarine Food Chains,
W73-13980 5C

FOOD HABITS
Food Habits and Growth of Channel Catfish Fry, Ictalurus punctatus,
W73-13855 8I

FOOD WEBS
Interactions of Tetrahymena pyriformis, Escherichia coli, Azotobacter vinelandii, and Glucose in a Minimal Medium,
W73-14095 5C

FORAGES
Larger Seeds of Winterfat Germinate Better,
W73-13996 2I

FORECASTING
Forecasting Water Use for Electric Power Generation,
W73-13705 6D

Forecasting Water Use for Policy Making: A Review,

Influence of Man on the Hydrological Cycle: Guidelines to Policies for the Safe Development of Land and Water Resources.
W73-13767 2A

The Wetlands Statutes: Regulation or Taking,
W73-13859 5G

Identification and Mapping of Soils, Vegetation, and Water Resources of Lynn County, Texas, by Computer Analysis of ERTS MSS Data,
W73-14128 7B

Agriculture, Forestry and Rangeland Resources,
W73-14132 7B

Land Use and Mapping,
W73-14133 7B

Application of ERTS Results to Land and Resource Management in the State of Mississippi,
W73-14138 7B

Investigation of Environmental Indices from the Earth Resources Technology Satellite, PR 568/MMC 200,
W73-14162 5A

LANDFILLS
Limitations of the Electrical Resistivity Method for Detecting Landfill Leachate in Alluvial Deposits,
W73-13758 5B

State, Department of Conservation V. Sheriff (Appeal From Judgment Enjoining Defendant From Placing Fill in a Lake Bed).
W73-13895 6E

LANDSLIDES
Landslides at Breckenridge, Pineview Golf Club, and Rockcliffe,
W73-13670 2J

LATVIAN SSR
The Cycling of Radioactive Sediments (Strontium-90) in the Lakes of Latvian SSR,
W73-13778 5C

LAW ENFORCEMENT
The Refuse Act of 1899: Its Scope and Role in Control of Water Pollution,
W73-13863 5G

LAWRENCE LAKE (MICH.)
A Probabilistic Approach to the Dynamics of Natural Populations of the Chydoridae (Cladocera, Crustacea),
W73-14057 2H

LEACHATES
A Study of Forest Soils and Leachates on Sloping Topography Using a Tension Lysimeter,
W73-13856 2G

LEAD
Solubility and Occurrence of Lead in Surface Water,
W73-13960 5B

LEAKAGE
Evaluation of Hydrological Properties of Aquitards and Their Role in Groundwater Management,
W73-13653 2F

LEASES
A Bill to Terminate and to Direct the Secretary of the Interior and the Secretary of the Navy to Take Action with Respect to Certain Leases Issued Pursuant to the Outer Continental Shelf Lands Act.
W73-13869 6E

LEECHES
Biota of Freshwater Ecosystems Identification Manual No. 8, Freshwater Leeches (Annelida: Hirudinea) of North America,
W73-13743 2I

LEGAL ASPECTS
How Much Manure Per Acre.
W73-13850 5G

The Dimensions of Coastal Zone Management.
W73-13858 6E

Claflin V. State Department of Natural Resources (Review of Denial by Department of Natural Resources of an Application for Permit for Structure in Lake).
W73-13887 6E

River Regulation by Storage Reservoirs.
W73-13888 6E

South County Drainage District V. Brevard County (Appeal by Drainage District from Judgment Denying District's Prayer for Permission to Amend Its Plan of Reclamation).
W73-13892 6E

Roberts V. Brewer (Bill in Equity to Abate Alleged Nuisance).
W73-13894 6E

State, Department of Conservation V. Sheriff (Appeal From Judgment Enjoining Defendant From Placing Fill in a Lake Bed).
W73-13895 6E

De Rahm V. Diamond (Suit to Review Agency's Issuance of a Certificate of 'Reasonable Assurance' that Proposed Construction of Facilities on a River Will Not Violate Water Quality Standards)
W73-13898 6E

LEGISLATION
A Synopsis of the National Water Commission's Final Report
W73-13676 6B

A Model Water Code, with Commentary.
W73-13857 4A

The Wetlands Statutes: Regulation or Taking.
W73-13859 5G

The Refuse Act of 1899: Its Scope and Role in Control of Water Pollution.
W73-13863 5G

Legislative Responses to Air and Water Pollution.
W73-13864 5G

An Examination of the Federal Water Pollution Control Act Amendments of 1972.
W73-13865 5G

State Legislation Concerning Marine Pollution from Vessels.
W73-13867 5G

Deep Water Ports.
W73-13868 6E

A Bill to Terminate and to Direct the Secretary of the Interior and the Secretary of the Navy to Take Action with Respect to Certain Leases Issued Pursuant to the Outer Continental Shelf Lands Act.
W73-13869 6E

A Bill to Amend the Federal Water Pollution Control Act in Order to Require the Approval of Adjacent Coastal States Prior to the Construction of Certain Offshore Facilities.
W73-13870 6E

A Bill to Prohibit Discharge into any Navigable Waters of any Military without Certification by the Environmental Protection Agency.
W73-13871 6E

A Bill to Amend the Federal Water Pollution Control Act.
W73-13872 6E

A Bill to be Entitled an Act Defining and Relating to the Management and Protection of Inland and Coastal Wetlands.
W73-13874 6E

Askew V. American Waterways Operators, Inc. (Constitutionality of Florida's Oil-Spill Prevention and Pollution Control Act).
W73-13879 6E

United States V. Consolidation Coal Company (Injunction to Stop Defendant's Discharge of Wastes into Navigable Waters Under the Refuse Act).
W73-13882 6E

Conservancy Districts Furnishing Water Supply.
W73-13883 6E

Reservoir Sites for Storage of Water.
W73-13884 6E

Jurisdiction over Various Drains and Exemptions.
W73-13885 6E

Rights of Way--Obstructions--Crossings--Connections.
W73-13886 6E

Orange County Audubon Society, Inc. V. Hold (Standing of Conservation Group to Sue as Citizen).
W73-13893 6E

Recent Developments in Water Management Policy of the United States Government,
W73-13920 6E

Small Town Wastewater Treatment,
W73-14046 5D

LEHMANN LOVEGRASS
Efficiency of Water Use and Associated Characteristics of Lehmann Lovegrass,
W73-13999 4A

LIFE CYCLES
Continuous Culture of Marine Diatoms Under Silicate Limitation. I. Synchronized Life Cycle of Skeletonema Costatum,
W73-14188 5C

LIFE HISTORY STUDIES
A Preliminary Comparison of the Zooplankton in a Tropical and a Temperate Lake (Lake George, Uganda and Loch Levan, Scotland),
W73-13732 5C

LIGHT-DARK INCUBATION
Effect of Eutrophication on BOD Testing under Turbulent Conditions,
W73-13909 5A

LIGNINS
Color of Pulp Industry Waste Liquors. II. Auxochromes and Chromophores in Chlorine-Oxylignin (In Japanese).
W73-14028 5B

LIME
Nitrate Removal by Ion Exchange,
W73-14008 5D

New Lime Process for Removal of Color From Kraft Mill Effluent at Georgia-Pacific Woodland, Maine, Mill,
W73-14053 5D

LIMESTONE CRUST
Catenary Soil Relationships in Israel: II. The Bet Guvrin Catena on Chalk and Nari Limestone Crust in the Shefela,
W73-13720 2G

LINEAR DECISION RULE
Designing Reservoir Control Policies with Chance Constrained Programming,
W73-14175 6A

LINEAR PROGRAMMING
Calibration of Distributed Parameter Groundwater Flow Models Viewed as a Multiple-Objective Decision Process Under Uncertainty,
W73-13699 2F

Conditional Chance-Constrained Model for Reservoir Control,
W73-13700 4A

Multiobjective Screening Models and Water Resource Investment,
W73-13704 6A

LIQUID CHROMATOGRAPHY
Determination of Benomyl Residues in Soils and Plant Tissues by High-Speed Cation Exchange Liquid Chromatography,
W73-14195 5A

LITERATURE REVIEWS
The Haematological Assessment of the Health of Freshwater Fish: A Review of Selected Literature,
W73-13813 5C

LITTLE RIVER (OKLA)
Floods of 1971 and 1972 on Glover Creek and Little River in Southeastern Oklahoma,
W73-13680 7C

LITTORAL DRIFT
Discharge of Suspended Sediment in the Littoral Zone of the Kakhovka Reservoir,
W73-13691 2J

LIVESTOCK
Animal Waste Management in Hawaii,
W73-13839 5D

Odor Control May be a Big Concern,
W73-13844 5D

Arizona Agri-File.
W73-14006 3F

LOCH LEVEN (SCOTLAND)
A Preliminary Comparison of the Zooplankton in a Tropical and a Temperate Lake (Lake George, Uganda and Loch Levan, Scotland),
W73-13732 5C

LOCKS
Analysis of Data from Instrumentation Program, Old River Lock,
W73-13678 8A

LONG ISLAND (NY)
Catalog of Recharge Basins on Long Island, New York, in 1969,
W73-14103 4B

LOUISIANA
Alternatives for A New Shrimp Law in Louisiana,
W73-14107 6E

LUMBERING
United States V. Kennebec Log Driving Company (Log Driving on Navigable River Permitted Under the Rivers and Harbors Act).
W73-13875 6E

LYNN COUNTY (TEX)
Identification and Mapping of Soils, Vegetation, and Water Resources of Lynn County, Texas, by Computer Analysis of ERTS MSS Data,
W73-14128 7B

LYSIMETER (TENSION)
A Study of Forest Soils and Leachates on Sloping Topography Using a Tension Lysimeter,
W73-13856 2G

MAGNESIUM
Nutritional Interrelationships of Dietary Calcium, Phosphorus, and Magnesium in Sheep,
W73-13853 5B

MAIZE PLANTS
Dynamics of Free Amino Acid Content in Maize Plants in Connection With Soil Water Regime (In Russian),
W73-13804 3F

MANAGEMENT
Calibration of Distributed Parameter Groundwater Flow Models Viewed as a Multiple-Objective Decision Process Under Uncertainty,
W73-13699 2F

Part I--Management of Water Resources Quality. The Natural Quality of Water Resources,
W73-13722 5G

Methods of Swine Manure Disposal,
W73-13824 5D

Economics of Water Pollution Control,
W73-13837 5G

Agricultural Wastes--A Management Problem,

International Symposium on Uncertainties in Hydrologic and Water Resource Systems, Vol III.
W73-14166 6A

A Ground-Water Planning Model - A Basis for a Data Collection Network,
W73-14176 6A

MANGANESE
Patterns of Change in Chemical Composition of Iron-Manganese Concretions in Sediments of the Northwestern Part of the Pacific Ocean (Zakonomernosti izmeneniya khimicheskogo sostava zhelezo-margantsevykh konkretsiy v osadkakh severo-z apadnoy chasti Tikhogo okeana),
W73-13688 2J

Iron and Manganese Forms in Sediments of the Northwest Pacific Ocean (Formy zheleza i margantsa v osadkakh severo-zapadnoy chasti Tikhogo okeana),
W73-13689 2J

MANURE STACKING
Seepage Losses and Fertilizer Preservation in Manure Stacking Practice,
W73-13831 5G

MAPPING
Ecological Effects of Strip Mining in Ohio,
W73-13780 5C

Symposium on Significant Results Obtained from Earth Resources Technology Satellite-1, March 5-9, 1973, Volume II Summary of Results.
W73-14126 7B

Review of ERTS-1 Status,
W73-14127 7B

A Multidisciplinary Survey for the Management of Alaskan Resources Utilizing ERTS Imagery,
W73-14130 7B

Application of ERTS-1 Imagery to Flood Inundation Mapping,
W73-14131 7B

Land Use and Mapping,
W73-14133 7B

The Earth Resources Program of the Corps of Engineers,
W73-14136 7B

Application of ERTS Results to Land and Resource Management in the State of Mississippi,
W73-14138 7B

MARGINAL BENEFITS
Marginal Economics Applied to Pipeline Design,
W73-13969 4A

MARINE ANIMALS
Review of Some Direct Effects of Spoil Dumping on Marine Animals,
W73-13782 5C

MARINE BACTERIA
Extractable Lipids of Gram-Negative Marine Bacteria: Phospholipid Composition,
W73-14066 5C

Polynucleotide Sequence Relationships Among Japanese and American Strains of Vibrio Parahaemolyticus,
W73-14067 5C

MARINE PLANTS
1972 Results of the Continued Intercomparisons of Methods for Analyses of Cesium, Cobalt, Silver and other Radionuclides Sponsored by IAEA. Part II: Analysis of Dried Seaweed Samples Collected by British Fisheries Radiobiological Laboratory,
W73-14182 5A

MARYLAND
Sewage Sludge Incorporation in Experimental Field Plots to Evaluate Hazards and Benefits, and Develop Techniques for Optimizing Benefits and Minimize Hazards (Final Environmental Statement).
W73-13860 5D

The Role of Organic Debris and Associated Microorganisms in Pelagic Estuarine Food Chains,
W73-13980 5C

MASS SPECTRA
A Simple, Off-Line Mass Spectra Digitizer,
W73-14093 7C

MASS SPECTRA DIGITIZER
A Simple, Off-Line Mass Spectra Digitizer,
W73-14093 7C

MASS SPECTROMETRY
Environmental Applications of Advanced Instrumental Analyses: Assistance Projects, FY 69-71,
W73-13662 5A

MASS TRANSFER
Biological Removal of Colloidal Matter from Wastewater,
W73-13984 5D

MATHEMATICAL MODELS
National and Interregional Models of Water Demand, Land Use, and Agricultural Policies,
W73-13707 6D

A Finite-Element, Planar-Flow Model of Camas Prairie, Idaho,
W73-13763 2F

On the Use of Material Balances for the Assessment of Self-Purification Capacity in Inland Waters, Lake Paijanne as an Example,
W73-13779 5C

A Physics-Based Approach to Hydrologic Response Modeling: Phase II: Applications,
W73-13854 2A

Relationship Between Stream Water Temperature and Ambiant Air Temperature (Relation entre la temperature de l'eau d'une riviere et la temperature de l'air ambiant),
W73-13992 2E

Mathematical Modeling of Streamflow (Matematicheskoye modelirovaniye rechnogo stoka),
W73-14142 2A

Uncertainties in Water Quality Modeling The Case of Atmospheric Reaeration,
W73-14169 5G

Entropy in the Assessment of Uncertainty in Hydrologic Systems Behavior and in Mathematical Model Performance,
W73-14170 6A

A Methodology for Testing System Theoretic Models,
W73-14172 6A

A Planning Model for Preliminary Network Design,
W73-14173 4A

MEASUREMENT
Estimation of Estuarine Marsh Productivity,
W73-14199 5B

MECHANICAL EQUIPMENT
Combined Sampling and Flow Measurement,
W73-13708 5A

Improving Surface Water Conditions Through Control and Disposal of Aquatic Vegetation, Phase II,
W73-13983 5G

A Probe for Sampling Mire Waters for Chemical and Gas Analysis,
W73-14198 5A

MEMBRANE FILTERS
Experimental Study on the Adsorption of Polio Vaccine Virus Type 2, During Filtration Through Millipore-Membrane Filters (In German),
W73-13994 5B

MEMBRANE PROCESSES
Use of Reverse Osmosis and Ultrafiltration for the Purification of Effluents (Primenenie metodov obratnogo osmosa i ul'trafil'tratsii pri ochistke stokov),
W73-14045 5D

MEMBRANES
Interface Condensation Desalination Membranes,
W73-13973 3A

MERCAPTANS
Determination of the Concentration of Mercaptans and Sulfide Ions in Aqueous Effluents, (Opredelenie kontsentratsii merkaptanov i sul'fid-iona v stochnykh vodakh),
W73-14032 5A

MERCURY
Ecological Implications of Dimethyl Mercury in an Aquatic Food Chain,
W73-13657 5C

Mercury in the Pulp and Paper Mill Environment--Appraisal and Perspective,
W73-14017 5B

Mercury and Other Trace Metals in the Environment. A Compilation of Federal Government Research Projects and Surveys August 1971.
W73-14089 5B

Anticatalytic Microdetermination of Mercury Using Cerium Arsenite Reaction,
W73-14200 5A

MERISTIC CHARACTERISTICS
Study of Certain Meristic Characteristics in Alestes Baremoze of the Lower Chari and Lake Chad,
W73-13798 2H

MESOPHYTE PLANTS
Effect of Wilting and Soil Drought on Endogenous Growth Regulators of Mesophyte Plants, (In Russian),
W73-14021 3F

METABOLISM
Stress Metabolism. I. Nitrogen Metabolism and Growth in the Barley Plant During Water Stress,
W73-14004 3F

METALS
Automated Solvent Extraction for the Determination of Trace Metals in Water by AAS (Atomic Absorption Spectrophotometry),
W73-14047 5A

METAMORPHOSIS
The Culture and Metamorphosis of the Tarpon, Tarpon Atlanticus Cuvier and Valenciennes,
W73-13794 8I

METEOROLOGICAL DATA
Some Aspects of Hydrometeorology,
W73-14124 2A

METHANE
Methane in Lake Kivu: New Data Bearing on its Origin,
W73-14016 2H

METHANOL
Methanol, Ethanol, and Acetone in Kraft Pulp Mill Condensate Streams,
W73-14019 5B

METHEMOGLOBINEMIA
Water Nitrate Methemoglobinemia in Children and Adolescents (In Russian),
W73-13806 5C

METHODOLOGY
Handbook for Analytical Quality Control in Water and Waste water Laboratories.
W73-13790 5A

A Methodology for Testing System Theoretic Models,
W73-14172 6A

A Probe for Sampling Mire Waters for Chemical and Gas Analysis,
W73-14198 5A

MICHIGAN
The Muskegon County Wastewater Management System.
W73-14042 5D

A Probabilistic Approach to the Dynamics of Natural Populations of the Chydoridae (Cladocera, Crustacea),
W73-14057 2H

Relation of Channel Slope to Reaeration of Michigan Streams,
W73-14110 5B

MICROBIAL DEGRADATION
Biological Removal of Colloidal Matter from Wastewater,
W73-13984 5D

Utilization of Hydrocarbons by Cladosporium Resinae,
W73-14065 5C

Effect of Nutrient Additions on the Apparent Cometabolism of DDT,
W73-14196 5C

MICROORGANISMS
Estimation of Growth Rate from Mitotic Index,
W73-14061 5B

MIDGES
Taxonomy and Ecology of Three New Species of Monodiamsa Kieffer, with Keys to Nearctic and Palaearctic Species of the Genus (Diptera: Chironomidae),
W73-14084 5A

MIGRATION
The Cycling of Radioactive Sediments (Strontium-90) in the Lakes of Latvian SSR,
W73-13778 5C

Overwintering Pink Shrimp, Penaeus duorarum, in Core and Pamlico Sounds, N.C.,
W73-14104 2L

MILITARY ASPECTS
The Draft United Nations Convention on the International Seabed Area--Department of Defense Considerations,
W73-13862 6E

MILTON KEYNES (ENGLAND)
Automatic Control at the Milton Keynes Works,
W73-13787 5D

MINE DRAINAGE
Combined Treatment of Municipal Wastewater and Acid Mine Drainage,
W73-13656 5D

MINERALOGY
Iron Sulfide Concretions in Bottom Sediments of Lake Baykal (Konkretsii sul'fidov zheleza v donnykh osadkakh Baykala),
W73-13753 2J

MINICOMPUTERS
Disc Storage for Minicomputer Applications,
W73-14079 7C

MINIMAL MEDIA
Interactions of Tetrahymena pyriformis, Escherichia coli, Azotobacter vinelandii, and Glucose in a Minimal Medium,
W73-14095 5C

MINNESOTA
Aquatic Plants from Minnesota Part 4 - Nutrient Composition,
W73-13716 2I

State, Department of Conservation V. Sheriff (Appeal From Judgment Enjoining Defendant From Placing Fill in a Lake Bed).
W73-13895 6E

MIRE WATERS
A Probe for Sampling Mire Waters for Chemical and Gas Analysis,
W73-14198 5A

MISSION LAKE (MONT)
Inflow, Outflow, and Water Quality of Mission Lake, North-Central Montana,
W73-14100 5G

MISSISSIPPI
Model Test of Box Inlet Drop Spillway and Stilling Basin Proposed for Tillatoba Creek, Tallahatchie County, Miss.,
W73-13781 8B

Application of ERTS Results to Land and Resource Management in the State of Mississippi,
W73-14138 7B

MISSISSIPPI RIVER
Analysis of Data from Instrumentation Program, Old River Lock,
W73-13678 8A

MISSOURI
Organic Wastes for Acid Strip-Mine Lake Recovery,
W73-13915 5G

MISSOURI RIVER BASIN
A River Basin Management Post-Audit and Analysis,
W73-13715 6B

MITOSIS
Estimation of Growth Rate from Mitotic Index,
W73-14061 5B

MIXED INTEGER PROGRAMMING
A Ground-Water Planning Model - A Basis for a Data Collection Network,
W73-14176 6A

MIXOLIMNION
A Study of Nutrient Variations in the Surface and Mixed Layer of Monterey Bay Using Automatic Analysis Techniques,
W73-14090 5B

MODEL CODE
A Model Water Code, with Commentary,
W73-13857 4A

MODEL STUDIES
Plume Temperature Measurements of Shallow, Submerged Model Discharges with Current,
W73-13821 5B

Modeling Snowmelt Runoff in an Arctic Coastal Basin,
W73-14109 5B

Mathematical Modeling of Streamflow (Matematicheskoye modelirovaniye rechnogo stoka),
W73-14142 2A

Designing Reservoir Control Policies with Chance Constrained Programming,
W73-14175 6A

First-Order Analysis of Model and Parameter Uncertainty,
W73-14180 6A

MOLLUSKS
Biota of Freshwater Ecosystems, Identification Manual No.3, Freshwater Sphaeriacean Clams (Mollusca: Pelecypoda) of North America,
W73-13738 2I

MOLYBDENUM
Molybdenum Toxicity: Abnormal Cellular Division of Teratogenic Appearance in Euglena Gracilis,
W73-14197 5C

MONITORING
Physico-Chemical Characteristics of the Municipal Waste Waters of the Great Montreal Area (Quebec) (Caracteristiques physico-chimiques des effluents urbains de l'agglomeration de Montreal (Quebec)),
W73-13991 5B

Adaptation of the TTC Test to the Study of Dehydrogenase Activity of Activated Sludge used for the Purification of Pulp Mill Effluents (Przystosowanie testu TTC do badania aktywnosci dehydrogenaz osadow czynnych oczyszczajacych sciek i pocelulozowe),
W73-14038 5D

Automated Solvent Extraction for the Determination of Trace Metals in Water by AAS (Atomic Absorption Spectrophotometry),
W73-14047 5A

Mineral Resources, Geologic Structure, and Landform Surveys,
W73-14134 7B

MONODIAMESA SPECIES *NEARCTIC SPECIES
Taxonomy and Ecology of Three New Species of Monodiamsa Kieffer, with Keys to Nearctic and Palaearctic Species of the Genus (Diptera: Chironomidae),
W73-14084 5A

MONROE COUNTY (ALABAMA)
Geology of Monroe County, Alabama,
W73-14158 7C

MONTANA
Animal Waste Disposal,
W73-13825 5G

Nitrogen and Phosphorus Availability in a Fertilized Rangeland Ecosystem of the Northern Great Plains,
W73-14001 2I

Energy Fixation and Precipitation-Use Efficiency in a Fertilized Rangeland Ecosystem of the Northern Great Plains,
W73-14002 2I

Inflow, Outflow, and Water Quality of Mission Lake, North-Central Montana,
W73-14100 5G

Water Resources of the Yellowstone River Valley, Billings to Park City, Montana,
W73-14115 7C

MONTE CARLO METHOD
An Approach to Formulating Strategies for Flood Frequency Analysis,
W73-14168 6A

MONTEREY BAY
A Study of Nutrient Variations in the Surface and Mixed Layer of Monterey Bay Using Automatic Analysis Techniques,
W73-14090 5B

MONTEREY BAY AREA (CALIF)
A Checklist of the Fishes of the Monterey Bay Area Including Elkhorn Slough, The San Lorenzo, Pajaro and Salinas Rivers,
W73-14101 2L

MONTREAL
Physico-Chemical Characteristics of the Municipal Waste Waters of the Great Montreal Area (Quebec) (Caracteristiques physico-chimiques des effluents urbains de l'agglomeration de Montreal (Quebec)),
W73-13991 5B

MORTALITY
Pesticide Levels in Water and Wildlife of Reelfoot Lake, Tennessee,
W73-13820 5C

MUDFLOWS
Groundwater Distribution, Karst, and Mudflows in the Carpathian Zone (Zakonomernosti raspredeleniya podzemnykh vod, karst i seli Karpatskoy zony),
W73-14143 2F

MULCHING
Improving Surface Water Conditions Through Control and Disposal of Aquatic Vegetation, Phase II,
W73-13983 5G

MULTIOBJECTIVE SCREENING MODELS
Multiobjective Screening Models and Water Resource Investment,
W73-13704 6A

MULTIPLE OBJECTIVES
Interactive Multiobjective Programing in Water Resources: A Case Study,
W73-13703 6A

MULTISECTORAL MODELS
A Multisectoral Model of Pacific and Mountain Interstate Trade Flows,
W73-13986 6A

MUNICIPAL WASTES
Agricultural Wastes--A Management Problem,
W73-13838 5B

Lagoon Performance and the State of Lagoon Technology.
W73-13985 5D

MUNICIPAL WATER
Price Elasticity of Demand for Municipal Water: A Case Study of Tucson, Arizona,
W73-13698 6D

MURDERKILL RIVER (DEL)
Estimation of Estuarine Marsh Productivity,
W73-14199 5B

MURPHY FLOWAGE (WIS)
Overwinter Drawdown: Impact on the Aquatic Vegetation in Murphy Flowage, Wisconsin,
W73-13723 5C

MUSKEGON COUNTY (MICH)
The Muskegon County Wastewater Management System.
W73-14042 5D

MUTAGENS
An Improved Bacterial Test System for the Detection and Classification of Mutagens and Carcinogens,
W73-14094 5A

MUTANTS
Ammonium Regulation in Aspergillus Nidulans,
W73-14068 5B

MYCOLOGICAL STUDIES
Phytosociological and Mycological Exploration of the Rixensart Heath and the Land Approaching it,
W73-14181 2I

MYSIDACEA
Introduction of Mysidacea into Ponds and Check-Ponds as a Method of Increasing Fish Productivity, (In Russian),
W73-13712 8I

NATIONAL WATER COMMISSION
A Synopsis of the National Water Commission's Final Report.
W73-13676 6B

NATURAL RESOURCES
Geology of Monroe County, Alabama,
W73-14158 7C

NAVIGABLE WATERS
United States V. Kennebec Log Driving Company (Log Driving on Navigable River Permitted Under the Rivers and Harbors Act).
W73-13875 6E

Jefferson National Bank at Sunny Isles V. Metropolitan Dade County (Ownership of Fill Placed Beyond Bulkhead Line).
W73-13880 6E

NAVIGATION
The Role of the United States Army Corps of Engineers in Water Management,
W73-13921 6E

NAVIGATION OBSTRUCTIONS
United States V. Kennebec Log Driving Company (Log Driving on Navigable River Permitted Under the Rivers and Harbors Act).
W73-13875 6E

NEBRASKA
Protection of a Unique Ecological Area Through Improved Water and Fertility Management,
W73-13667 5G

NEGEV DESERT
Eco-Physiological Investigations on Wild and Cultivated Plants in the Negev Desert: II. The Influence of Climatic Factors on Carbon Dioxide Exchange and Transpiration at the End of the Dry Period,
W73-13792 2D

NETWORK DESIGN
Network Planning and Design: Part A, Review of Scientific Approaches and Problems in Hydrological Network Design,
W73-13771 2A

Network Planning and Design: Part B, Network Design for Observation of Water Quality, Sediment Transport, Ground Water, and Soil Moisture.
W73-13772 2A

A Planning Model for Preliminary Network Design,
W73-14173 4A

NEVADA
Forecasts for the Future-Population,
W73-13674 6B

NEW ENGLAND
Planning in the New England Region,
W73-13928 6E

NEW HAMPSHIRE
Ground-Water Resources of the Ashuelot River Basin, Southwestern New Hampshire,
W73-14116 7C

Soft-Shell Clam Population Study in Hampton Seabrook Harbor, New Hampshire,
W73-14151 2L

NEW JERSEY
Survey of Estuarine Site Development Lagoon Homeowners, Ocean County, New Jersey,
W73-13818 6B

Uncertainties in Water Quality Modeling: The Case of Atmospheric Reaeration,
W73-14169 5G

NEW MEXICO
Larger Seeds of Winterfat Germinate Better,
W73-13996 2I

NEW YORK
The Impact of Reservoir Recreation on the Whitney Point Microregion of New York State,

Studies of the Helminth Fauna of Norway: XX. Seasonal Cycles of Fish Parasites in the Glomma,
W73-14007 2I

NUCLEAR MAGNETIC RESONANCE
Environmental Applications of Advanced Instrumental Analyses: Assistance Projects, FY 69-71,
W73-13662 5A

NUTRIENT REQUIREMENTS
Soil Properties and Nutrient Availability in Tarweed Communities of Central Washington,
W73-14000 2I

Nitrogen and Phosphorus Availability in a Fertilized Rangeland Ecosystem of the Northern Great Plains,
W73-14001 2I

Energy Fixation and Precipitation-Use Efficiency in a Fertilized Rangeland Ecosystem of the Northern Great Plains,
W73-14002 2I

NUTRIENT SOURCES
Stimulated Biodegradation of Oil Slicks Using Oleophilic Fertilizers,
W73-14086 5G

NUTRIENTS
An Investigation of the Cause and Effect of Eutrophication in Long Lake, Washington,
W73-13658 5C

Aquatic Plants from Minnesota Part 4 - Nutrient Composition,
W73-13716 2I

Removal of Phosphates in Wastewater by the Periphyton Communities of Rotating Discs,
W73-13725 5D

Plankton Composition in Relation to Nutrient Inflow in a Small New Zealand Lake,
W73-13733 5C

Effect of Waste Discharges into A Silt-Laden Estuary, A Case Study of Cook Inlet, Alaska,
W73-13815 5C

Seepage Losses and Fertilizer Preservation in Manure Stacking Practice,
W73-13831 5G

Nutrient Inputs and Their Relationship to Accelerated Eutrophication in Lake Michigan,
W73-13905 5C

Chemical Response of Utah Lake to Nutrient Inflow,
W73-14081 5C

A Study of Nutrient Variations in the Surface and Mixed Layer of Monterey Bay Using Automatic Analysis Techniques,
W73-14090 5B

NUTRITIONAL INTERRELATIONSHIPS
Nutritional Interrelationships of Dietary Calcium, Phosphorus, and Magnesium in Sheep,
W73-13853 5B

OBSTRUCTION TO FLOW
Rights of Way--Obstructions--Crossings--Connections.
W73-13886 6E

OCEAN CURRENTS
Kinematics of Water Particle Motion Within the Surf Zone,
W73-14105 2E

OCEAN WAVES
Maps Showing Areas of Potential Inuncation by Tsunamis in the San Francisco Bay Region, California,
W73-13682 7C

Tsunami Waves (Volny tsunami).
W73-13751 2L

Kinematics of Water Particle Motion Within the Surf Zone,
W73-14105 2E

OCEANOGRAPHY
Methods of Calculating Parameters of Turbidity Currents (O metodakh rascheta parametrov suspenzionnykh potokov),
W73-14140 2E

Some Kinematic Characteristics of Surf Swash (Nekotoryye cherty kinematiki priboynogo potoka),
W73-14141 2E

ODOR
Quality Goals for Potable Water.
W73-13785 5G

Identification of Beef Cattle Feedlot Odors,
W73-13836 5A

Odor Control May be a Big Concern,
W73-13844 5D

New Odor Control Project.
W73-13846 5D

OHIO
Ecological Effects of Strip Mining in Ohio,
W73-13780 5C

Monfort Looks at Treated Manure for Tile and Plastic.
W73-13848 5D

OIL IMPORTS
Institutional Implications of U.S. Deepwater Port Development for Crude Oil Imports,
W73-13987 8A

OIL POLLUTION
Deep Water Ports.
W73-13868 6E

Method and Apparatus for Removing and Reclaiming Oil-Slick from Water,
W73-13971 5G

Oil Mop and Method of Using Same,
W73-13974 5G

Water-Surface Cleansing Ship,
W73-13977 5G

Process and Apparatus for Containment of Aqueous Pollutants,
W73-13978 5G

Oil Spill Boom,
W73-13979 5G

OIL SINKING METHODS
Investigation of Sinking Methods for Removal of Oil Pollution From Water Surfaces; Report 3. Tests and Evaluation of Oil Sinking Materials,
W73-13696 5G

OIL SLICKS
Process and Apparatus for Containment of Aqueous Pollutants,
W73-13978 5G

OIL SPILL BOOMS
Oil Spill Boom,
W73-13979 5G

OIL SPILLS
Environmental Applications of Advanced Instrumental Analyses: Assistance Projects, FY 69-71,
W73-13662 5A

Investigation of Sinking Methods for Removal of Oil Pollution From Water Surfaces; Report 3. Tests and Evaluation of Oil Sinking Materials,
W73-13696 5G

Implications of Waste Treatment Processes and Arctic Receiving Waters,
W73-13748 5B

Oil Pollution and the Brussels Convention,
W73-13866 5G

Askew V. American Waterways Operators, Inc. (Constitutionality of Florida's Oil-Spill Prevention and Pollution Control Act).
W73-13879 6E

Method and Apparatus for Removing and Reclaiming Oil-Slick from Water,
W73-13971 5G

Oil Mop and Method of Using Same,
W73-13974 5G

Water-Surface Cleansing Ship,
W73-13977 5G

Oil Spill Emergency,
W73-14025 5G

Stimulated Biodegradation of Oil Slicks Using Oleophilic Fertilizers,
W73-14086 5G

OILY WATER
Investigation of Sinking Methods for Removal of Oil Pollution From Water Surfaces; Report 3. Tests and Evaluation of Oil Sinking Materials,
W73-13696 5G

OKANAGAN BASIN
Water Resources Planning in the Okanagan Basin,
W73-13934 6E

OKLAHOMA
Floods of 1971 and 1972 on Glover Creek and Little River in Southeastern Oklahoma,
W73-13680 7C

New Odor Control Project.
W73-13846 5D

Boomer Creek Channel Improvement (Local Flood Protection Project), Stillwater, Oklahoma, (Final Environmental Statement).
W73-13861 4A

Geology and Earth Resources of Oklahoma,
W73-14153 7C

Reconnaissance of the Water Resources of the Tulsa Quadrangle, Northeastern Oklahoma,
W73-14160 7C

OLD RIVER LOCK (MISSISSIPPI RIVER)
Analysis of Data from Instrumentation Program, Old River Lock,
W73-13678 8A

OLEOPHILIC FERTILIZERS
Stimulated Biodegradation of Oil Slicks Using Oleophilic Fertilizers,
W73-14086 5G

OLIGOTROPHY
Some Effects of Mysid Introduction and Nutrient Enrichment on a Large Oligotrophic Lake and Its Salmonids,
W73-13776 5C

ONTARIO WATER RESOURCES COMMISSION
Some Experiences of the Ontario Water Resources Commission,
W73-13930 6E

OPEN CHANNELS
Flow Augmenting Effects of Additives on Open Channel Flows,
W73-13664 5G

OPERATING COSTS
The Price Tag to Stop Feedlot Run-Off,
W73-13843 5D

OPERATION AND MAINTENANCE
A Ground-Water Planning Model - A Basis for a Data Collection Network,
W73-14176 6A

OPTIMIZATION
Interactive Multiobjective Programing in Water Resources: A Case Study,
W73-13703 6A

Optimizing the Supply of Inland Water Transport,
W73-13968 4A

Marginal Economics Applied to Pipeline Design,
W73-13969 4A

Optimal Procedures for the Processing of Waste Activated Sludge,

Designing Reservoir Control Policies with Chance Constrained Programming,
W73-14175 6A

A Ground-Water Planning Model - A Basis for a Data Collection Network,
W73-14176 6A

OREGON
Water Lands and Boundaries,
W73-13655 6E

Reactor Cooling Water for Agro-Industrial Development,
W73-13819 5D

Periwinkle Creek RC and D Project Measure, Upper Willamette RC and D Project, Oregon (Final Environmental Statement).
W73-14106 4A

Ground Water in the Eugene-Springfield Area, Southern Willamette Valley, Oregon,
W73-14113 2F

OREGON LAKES
A Classification of the Lakes of Oregon,
W73-13717 2H

OREGON WATER LAW
Water Lands and Boundaries,
W73-13655 6E

ORGANIC COMPOUNDS
Review of Some Direct Effects of Spoil Dumping on Marine Animals,
W73-13782 5C

Application of the Oxygen Method in Algotoxic Investigations,
W73-13906 5C

Utilization of Hydrocarbons by Cladosporium Resinae,
W73-14065 5C

ORGANIC MATTER
Biological Transformation of Organic Matter in a River,
W73-13727 5C

Amino Acids in Organic Matter from Suspensions, Water, Sediments, and Pore Solutions in the Black Sea (Aminokislotnyy sostav organicheskogo veshchestva vzvesi, vody, osadkov i gruntovykh rastvorov Chernogo morya),
W73-13756 5B

Quality Goals for Potable Water.
W73-13785 5G

Public Health Aspects of Organics in Water,
W73-14098 5C

ORGANIC SOLVENTS
Solvent Characterization by Gas-Liquid Partition Coefficients of Selected Solutes,
W73-14088 5B

ORGANIC WASTES
Organic Wastes for Acid Strip-Mine Lake Recovery,
W73-13915 5G

ORTHOPHOSPHATES
An Investigation of the Cause and Effect of Eutrophication in Long Lake, Washington,
W73-13658 5C

OTTAWA (ONTARIO)
Landslides at Breckenridge, Pineview Golf Club, and Rockcliffe,
W73-13670 2J

OUTDOOR RECREATION PLAN (USA)
Outdoor America--A Plan for Providing Recreation Opportunities to the Nation.
W73-14165 6B

OWNERSHIP OF BEDS
Water Lands and Boundaries,
W73-13655 6E

OXIDATION
Aeration of Natural Waters, A Bibliography.
W73-13651 5G

OXIDATION LAGOONS
Lagoon Performance and the State of Lagoon Technology.
W73-13985 5D

OXIDATION PONDS
Experiment Using Biological Ponds for Additional Purification of Sewage Water (In Russian),
W73-13802 5D

OXIDATION-REDUCTION POTENTIAL
pH and Eh Control of Cultures of Sulphate-Reducing Bacteria,
W73-14191 5C

OXYGEN
Yield of Flue-Cured Tobacco and Levels of Soil Oxygen in Lysimeters with Different Water Table Depths,
W73-13908 3F

Oxygen Toxicity and the Superoxide Dismutase,
W73-14069 5C

OXYGENATION
Waste Water Purification Through Catalytic Wet Oxidation (Abwasserklaerung durch katalytische Nassoxydation).
W73-14010 5D

PACIFIC NORTHWEST RIVER BASINS COMMISSION
Planning for the Pacific Northwest,
W73-13926 6E

PACIFIC OCEAN
Balance of Reducing Processes in Sediments of the Pacific Ocean (Balans reduktsionnykh protsessov v osadkakh Tikhogo okeana),
W73-13686 2J

Sulfur in Sediments of the Pacific Ocean East of Japan (Sera v tikhookeanskikh osadkakh k vostoku ot Yaponii),
W73-13687 2J

Patterns of Change in Chemical Composition of Iron-Manganese Concretions in Sediments of the Northwestern Part of the Pacific Ocean (Zakonomernosti izmeneniya khimicheskogo sostava zhelezo-margantsevykh konkretsiy v osadkakh severo-z apadnoy chasti Tikhogo okeana),
W73-13688 2J

Iron and Manganese Forms in Sediments of the Northwest Pacific Ocean (Formy zheleza i margantsa v osadkakh severo-zapadnoy chasti Tikhogo okeana),
W73-13689 2J

PALAEARCTIC SPECIES
Taxonomy and Ecology of Three New Species of Monodiamsa Kieffer, with Keys to Nearctic and Palaearctic Species of the Genus (Diptera: Chironomidae),
W73-14084 5A

PAMLICO SOUND (NC)
Overwintering Pink Shrimp, Penaeus duorarum, in Core and Pamlico Sounds, N.C.,
W73-14104 2L

PANDORINA MORUM
Further Observations on a Growth Inhibiting Substance Produced by Pandorina morum,
W73-13900 5C

PARAFFINS
A Method for the Identification of Branched-Chain Paraffins by Calculation of Their Retention Index Values on the Basis of Molecular Structure and Physical Properties,
W73-14059 5A

PARAMETRIC HYDROLOGY
Comparison of Statistical and Deterministic Approaches in the Determination of Hydrological Parameters of Aquifers,
W73-14171 2F

PARASITES
New Parasite Records for Lake Erie Fish,
W73-13749 5C

PARASITES (FISH)
Studies of the Helminth Fauna of Norway: XX. Seasonal Cycles of Fish Parasites in the Glomma,
W73-14007 2I

PARASITES MICROSPORIDIAN
Infection of American Smelt in Lake Ontario and Lake Erie with the Microsporidian Parasite Glugea Hertwigi (Weissenberg),
W73-13718 5C

PARASITIC DISEASES (FISH)
Contributions to the Recognizing of Infectious and Parasitic Diseases of Fishes Living in the Moderate Brackish Waters of Romania (In Rumanian),
W73-13810 5C

PARR
Behavior of Young Atlantic Salmon (Salmo salar) Exposed to or Force-Fed Fenitrothion, an Organophosphate Insecticide,
W73-14083 5C

PARTICLE SIZE
Estimate of the Content of Spray Drops in the Near-Water Layer of the Atmosphere,
W73-13690 2B

PARTITION COEFFICIENTS
Solvent Characterization by Gas-Liquid Partition Coefficients of Selected Solutes,
W73-14088 5B

PASSAIC RIVER BASIN (N.J.)
Uncertainties in Water Quality Modeling: The Case of Atmospheric Reaeration,
W73-14169 5G

PATENTS
Phenol Plant Effluent Treatment,
W73-13970 5D

Method and Apparatus for Removing and Reclaiming Oil-Slick from Water,
W73-13971 5G

Device for Aerating Liquids,
W73-13972 5D

Interface Condensation Desalination Membranes,
W73-13973 3A

Oil Mop and Method of Using Same,
W73-13974 5G

Baffle Waste Treatment Tank,
W73-13975 5D

Package Sewage Treatment Plant,
W73-13976 5D

Water-Surface Cleansing Ship,
W73-13977 5G

Process and Apparatus for Containment of Aqueous Pollutants,
W73-13978 5G

Oil Spill Boom,
W73-13979 5G

PATH OF POLLUTANTS
Computer Studies of Estuary Water Quality,
W73-13907 5B

Solubility and Occurrence of Lead in Surface Water,
W73-13960 5B

Contamination of Discharge Well From Recharge Well,
W73-13962 5B

Trinity Bay Study: Dye Tracing Experiments,
W73-14164 5B

Transfer of CS-137 From Detritus to Primary Producer,
W73-14183 5B

PATHOGENIC BACTERIA
Identification of Actinomyces, Arachnia, Bacterionema, Rothia, and Propionibacterium Species by Defined Immunofluorescence,
W73-14060 5A

Polynucleotide Sequence Relationships Among Japanese and American Strains of Vibrio Parahaemolyticus,
W73-14067 5C

Nitrate Reduction and the Growth of Veillonella Alcalescens,
W73-14070 5B

Sensitivity of Vibrio parahaemolyticus to Cold in Oysters, Fish Fillets and Crabmeat,
W73-14072 5C

PATHOGENIC FUNGI
Ammonium Regulation in Aspergillus Nidulans,
W73-14068 5B

PEAK DISCHARGE
Determination of Peak Discharge of a Medium-Sized Watershed for the Required Frequency by Simplified Rational Method,
W73-14121 2A

PEARSON III DISTRIBUTION
Errors in the Estimation of Hydrologic Variates in the Case of Pearson III Law (Erreurs sur l'estimation des variates hydrologiques dans le cas de la loi Pearson III),
W73-13993 7A

PEAT
Peat in Pollution Abatement,
W73-14023 5D

PEAT BOGS
First Report on a Level Peat Bog of Eastern Trentino (Fiave), (In Italian),
W73-13809 2L

PELECYPODS
Biota of Freshwater Ecosystems, Identification Manual No.3, Freshwater Sphaeriacean Clams (Mollusca: Pelecypoda) of North America,
W73-13738 2I

PENNSYLVANIA
Combined Treatment of Municipal Wastewater and Acid Mine Drainage,
W73-13656 5D

Recycling Fine-Paper Mill Effluent by Means of Pressure Filtration,
W73-14051 5D

Investigation of Environmental Indices from the Earth Resources Technology Satellite, PR 568/MMC 200,
W73-14162 5A

PERCOLATION
A Case of Planned Percolation of Liquid From Two Parallel Channels,
W73-13694 8B

PERCOLATION

Pollution Loads in Percolate Water from Surface Spread Swine Wastes,
W73-13822 5B

PERFORMANCE EVALUATION

Selective Potassium-Sensitive Electrodes Based on Potassium Tetra-P-Chlorophenylborate-Poly (Vinyl Chloride) Sensor Membranes,
W73-14075 5A

PERIPHYTIC ROTATING DISCS

Removal of Phosphates in Wastewater by the Periphyton Communities of Rotating Discs,
W73-13725 5D

PERIPHYTON

Removal of Phosphates in Wastewater by the Periphyton Communities of Rotating Discs,
W73-13725 5D

PERMITS

Animal Waste Disposal,
W73-13825 5G

Water Pollution Control.
W73-13891 6E

PERSONNEL MANAGEMENT

Career Development Guide for Wastewater Facility Personnel,
W73-14092 5G

PESTICIDE RESIDUES

Pesticide Levels in Water and Wildlife of Reelfoot Lake, Tennessee,
W73-13820 5C

Levels of Chlorinated Hydrocarbon in Catfish in Alabama, Arkansas, Florida, Georgia, Louisiana and Mississippi.
W73-13904 5C

Progress Report on Aquatic Weed and Algae Control Studies,
W73-13912 5G

Laboratory Evaluation of Residues Maintained in Water Treated with Polyethylene Formulations of Chlorpyrifos, December 1971 - April 1972,
W73-14184 5A

PESTICIDE TOXICITY

Fly Control and Chronic Toxicity from Feeding Dursban (0,0-Diethyl 0-3, 5, 6-Trichloro-2-Pyridyl Phosphorothioate) to Laying Hens,
W73-13851 5G

PESTICIDES

Environmental Applications of Advanced Instrumental Analyses: Assistance Projects, FY 69-71,
W73-13662 5A

Detection of Naturally Fluorescent Pesticides on Silica Gel Layers,
W73-14058 5A

Utilization of Hydrocarbons by Cladosporium Resinae,
W73-14065 5C

PHENOLS

Phenol Plant Effluent Treatment,
W73-13970 5D

PHORPHORUS

Nutritional Interrelationships of Dietary Calcium, Phosphorus, and Magnesium in Sheep,
W73-13853 5B

PHOSPHATES

Removal of Phosphates in Wastewater by the Periphyton Communities of Rotating Discs,
W73-13725 5D

PHOSPHOLIPIDS

Extractable Lipids of Gram-Negative Marine Bacteria: Phospholipid Composition,
W73-14066 5C

PHOSPHORUS

Persistence of Manure Phosphorus Availability in Calcareous Soil,
W73-13823 5B

Nitrogen and Phosphorus Availability in a Fertilized Rangeland Ecosystem of the Northern Great Plains,
W73-14001 2I

Stimulated Biodegradation of Oil Slicks Using Oleophilic Fertilizers,
W73-14086 5G

Nutrient Cycling and Productivity of Dystrophic Lake-BOG Systems (Part A),
W73-14185 5C

PHOSPHOTHIOATE PESTICIDES

Behavior of Young Atlantic Salmon (Salmo salar) Exposed to or Force-Fed Fenitrothion, an Organophosphate Insecticide,
W73-14083 5C

PHOTODECOMPOSITION

Photolysis of Ethylenethiourea,
W73-14194 5C

PHOTOLYSIS

Photolysis of Ethylenethiourea,
W73-14194 5C

PHOTOSYNTHESIS

Water and Photosynthesis Relations of Desert Plants in the Mauritanian Sahara: II. Alternating-Green, Switch-Branched and Stem-Succulent Trees,
W73-13801 2I

The Influence of Simazine on the Photosynthetic Pigments of Green Algae,
W73-13901 5C

PHYSICAL PROPERTIES

A Method for the Identification of Branched-Chain Paraffins by Calculation of Their Retention Index Values on the Basis of Molecular Structure and Physical Properties,
W73-14059 5A

PHYSICOCHEMICAL PROPERTIES

Plankton Composition in Relation to Nutrient Inflow in a Small New Zealand Lake,
W73-13733 5C

PHYTOPLANKTON

Biological Impact of Combined Metallic and Organic Pollution in the Coeur D'Alene-Spokane River Drainage System,
W73-13659 5B

Correlation Between Dissolved Oxygen and Phytoplankton in the Lower Reaches of Volta Lake, Ghana,
W73-13735 5C

PHYTOSOCIOLOGICAL STUDIES

Phytosociological Studies on Green Meadow Vegetation of Tama River Near Tokyo, with a Comparative Study of the Vegetation of the Tone River,
W73-14097 2I

Phytosociological and Mycological Exploration of the Rixensart Heath and the Land Approaching it,
W73-14181 2I

PHYTOTOXICITY

Progress Report on Aquatic Weed and Algae Control Studies,
W73-13912 5G

PILES (FOUNDATIONS)

Wave Forces on Pile Including Diffraction and Viscous Effects,
W73-13963 8B

PINK SHRIMP

Overwintering Pink Shrimp, Penaeus duorarum, in Core and Pamlico Sounds, N.C.,
W73-14104 2L

PIPELINES

Marginal Economics Applied to Pipeline Design,
W73-13969 4A

Pipelines and Trout Water,
W73-14048 4C

PLANKTON

Plankton Composition in Relation to Nutrient Inflow in a Small New Zealand Lake,
W73-13733 5C

PLANNING

Forecasts for the Future-Population,
W73-13674 6B

Storm Drainage Plan Study Design.
W73-13683 4A

Regional Water Supply/Sewage Disposal Plan and Short-Range Program, 1973-1978.

REYNOLDS CREEK EXPERIMENTAL WATERSHED
A Physics-Based Approach to Hydrologic Response Modeling: Phase II: Applications,
W73-13854 2A

RHODE ISLAND SOUND
Effects of Spoil Dumping on the Benthic Invertebrates of the Sound,
W73-13783 5C

Fisheries Resources in the Dump Site Area,
W73-13784 5C

RIPARIAN RIGHTS
Jefferson National Bank at Sunny Isles V. Metropolitan Dade County (Ownership of Fill Placed Beyond Bulkhead Line).
W73-13880 6E

RIPRAP
Model Test of Box Inlet Drop Spillway and Stilling Basin Proposed for Tillatoba Creek, Tallahatchie County, Miss.,
W73-13781 8B

RISKS
Calibration of Distributed Parameter Groundwater Flow Models Viewed as a Multiple-Objective Decision Process Under Uncertainty,
W73-13699 2F

International Symposium on Uncertainties in Hydrologic and Water Resource Systems, Vol III.
W73-14166 6A

Uncertainties in Hydraulic Models,
W73-14167 6A

Uncertainties in Water Quality Modeling: The Case of Atmospheric Reaeration,
W73-14169 5G

Entropy in the Assessment of Uncertainty in Hydrologic Systems Behavior and in Mathematical Model Performance,
W73-14170 6A

A Planning Model for Preliminary Network Design,
W73-14173 4A

Uncertainties Resulting From Man-Made Structures,
W73-14174 8A

Subjective Inputs and Uncertainty in Decision Problems,
W73-14177 6A

RIVER BASIN COMMISSIONS
A Water Supply Study of the Saskatchewan-Nelson Basin,
W73-13933 6E

RIVER BASIN COMMISSIONS

Water Resources Planning in the Okanagan Basin,
W73-13934 6E

RIVER BASIN DEVELOPMENT

Multiobjective Screening Models and Water Resource Investment,
W73-13704 6A

Water Resource Planning for the Susquehanna River Basin,
W73-13931 6E

RIVER-BASINS

A River Basin Management Post-Audit and Analysis,
W73-13715 6B

Water Resources of the Yellowstone River Valley, Billings to Park City, Montana,
W73-14115 7C

RIVER ECOLOGY

River Ecology and Man. Proceedings of an International Symposium.
W73-13791 6G

RIVER REGULATION

River Regulation by Storage Reservoirs.
W73-13888 6E

RIVERS

Biological Transformation of Organic Matter in a River,
W73-13727 5C

Bioassay and Chemical Composition of Some Carpathian Rivers,
W73-13734 5C

Geochemistry of the Ganga River Water,
W73-14120 2K

RIVERS AND HARBORS ACT

The Refuse Act of 1899: Its Scope and Role in Control of Water Pollution,
W73-13863 5G

United States V. Kennebec Log Driving Company (Log Driving on Navigable River Permitted Under the Rivers and Harbors Act).
W73-13875 6E

United States Ex Rel. Scott V. United States Steel Corp. (Action to Restrain Steel Company from Discharging Waste Water into Lake Michigan).
W73-13876 6E

U.S. V. American Cyanamid Company (Criminal Prosecution for Waste Discharges in Violation of the Refuse Act).
W73-13878 6E

United States V. Rohm and Haas Company (Action to Enjoin Industrial Discharge into Houston Channel under the Refuse Act).
W73-13881 6E

United States V. Consolidation Coal Company (Injunction to Stop Defendant's Discharge of Wastes into Navigable Waters Under the Refuse Act).
W73-13882 6E

ROMANIA

Contributions to the Recognizing of Infectious and Parasitic Diseases of Fishes Living in the Moderate Brackish Waters of Romania (In Rumanian),
W73-13810 5C

ROTIFER FAUNA

The Rotifer Fauna of Rock-Pools in the Tvarminne Archipelago, Southern Finland
W73-14011 2I

ROUTING

An Empirical Method of Estimating Daily Average Basinwide Snowmelt,
W73-13761 2C

RUMINANTS

Aquatic Plants from Minnesota Part 4 - Nutrient Composition,
W73-13716 2I

RUNOFF

Entropy in the Assessment of Uncertainty in Hydrologic Systems Behavior and in Mathematical Model Performance,
W73-14170 6A

RUNOFF FORECASTING

Status and Trends in Hydrological Forecasts: Part A, Forecasting of Run-off, River and Lake Level, Ice Conditions and Surface-Water Temperature,
W73-13769 2A

Modeling Snowmelt Runoff in an Arctic Coastal Basin,
W73-14109 5B

SAHARA (MAURITANIAN)

Water and Photosynthesis Relations of Desert Plants in the Mauritanian Sahara: II. Alternating-Green, Switch-Branched and Stem-Succulent Trees,
W73-13801 2I

SALINE SOILS

Role of Depth and Quality of Watertable on Soil Salinization,
W73-14122 2G

SALINE WATER INTRUSION

Studies of Tidal Effects on the River Zuari, Goa,
W73-14119 2E

SALINITY

Effects of Saline Waters Upon Survival of Fish Eggs and Larvae and Upon the Ecology of the Fathead Minnow in North Dakota,
W73-13981 5C

SALMON

Salmon That Need Never See the Sea,
W73-13842 5D

Expediency of Fall Chinook Salmon Acclimatization, (In Russian),
W73-14020 8I

SALMONELLA

Salmonella in the Laying Hen. I. Salmonella Recovery from Viscera, Feces and Eggs Following Oral Inoculation,
W73-13852 5B

SALMONELLA TYPHIMURIUM

An Improved Bacterial Test System for the Detection and Classification of Mutagens and Carcinogens,
W73-14094 5A

SALMONIDS

Some Effects of Mysid Introduction and Nutrient Enrichment on a Large Oligotrophic Lake and Its Salmonids,
W73-13776 5C

SAMPLE PREPARATION

Inoculation Techniques. Effects Due to Quality and Quantity of Inoculum.
W73-14077 5A

Determination of Benomyl Residues in Soils and Plant Tissues by High Speed Cation Exchange Liquid Chromatography.
W73-14195 5A

SAMPLING

Combined Sampling and Flow Measurement.
W73-13708 5A

SAN FRANCISCO BAY REGION (CALIF)

Maps Showing Areas of Potential Inundation by Tsunamis in the San Francisco Bay Region, California,
W73-13682 7C

SAND WAVES

Determination of Kennedy's Parameter for Dunes,
W73-13961 2J

SANITARY ENGINEERING

Limitations of the Electrical Resistivity Method for Detecting Landfill Leachate in Alluvial Deposits,
W73-13758 5B

SATELLITES (ARTIFICIAL)

Symposium on Significant Results Obtained from Earth Resources Technology Satellite-1, March 5-9, 1973, Volume II Summary of Results.
W73-14126 7B

Review of ERTS-1 Status,
W73-14127 7B

Identification and Mapping of Soils, Vegetation, and Water Resources of Lynn County, Texas, by Computer Analysis of ERTS MSS Data,
W73-14128 7B

Preliminary Geologic Application of ERTS-1 Imagery in Alaska,
W73-14129 7B

A Multidisciplinary Survey for the Management of Alaskan Resources Utilizing ERTS Imagery,
W73-14130 7B

Agriculture, Forestry and Rangeland Resources,
W73-14132 7B

Land Use and Mapping,
W73-14133 7B

Mineral Resources, Geologic Structure, and Landform Surveys,
W73-14134 7B

Water Resources,
W73-14135 7B

The Earth Resources Program of the Corps of Engineers,
W73-14136 7B

Application of ERTS-1 Data to Aid in Solving Water Resources Management Problems in the State of California,
W73-14137 7B

Application of ERTS Results to Land and Resource Management in the State of Mississippi,
W73-14138 7B

Investigation of Environmental Indices from the Earth Resources Technology Satellite, PR 568/MMC 200,
W73-14162 5A

SAUDI ARABIA
Water Supply and Treatment in Two Regions of Saudi Arabia,
W73-13995 5F

SAUNDERS (W VA)
Analysis of Coal Refuse Dam Failure, Middle Fork Buffalo Creek, Saunders, West Virginia.
W73-14163 8A

SAVEALLS
New Flotation Aids for Cellulosic Fibers (Novi flotoreagenti za tselulozni vlakna),
W73-14027 5D

SCOUR
Model Test of Box Inlet Drop Spillway and Stilling Basin Proposed for Tillatoba Creek, Tallahatchie County, Miss.,
W73-13781 8B

SEA LEVEL
Study of Wind-Induced Tidal Oscillations of Sea and Reservoir Surfaces,
W73-13692 2H

SEA OF AZOV
Boron in the Clay Fraction of Bottom Sediments in The Sea of Azov (Bor v glinistoy fraktsii donnykh otlozheniy Azovskogo morya),
W73-13755 2K

SEA WATER
Vertical Distribution of Dissolved Trace Elements in Black Sea Water (O vertikal'nom raspredelenii mikroelementov, rastvorennykh v vode Chernogo morya),
W73-13754 5B

A Study of Nutrient Variations in the Surface and Mixed Layer of Monterey Bay Using Automatic Analysis Techniques,
W73-14090 5B

Trace Inorganics,
W73-14190 5A

SEAFOOD
Evaluation of Potential Risk of Botulism from Seafood Cocktails,
W73-14062 5C

Sensitivity of Vibrio parahaemolyticus to Cold in Oysters, Fish Fillets and Crabmeat,
W73-14072 5C

SEASHORES
The Dimensions of Coastal Zone Management.
W73-13858 6E

SEASONAL
Seasonal Changes in Water Chemistry of a Tropical Lake (Lago Do Castanho, Amazonia, South America),
W73-13731 5C

A Probabilistic Approach to the Dynamics of Natural Populations of the Chydoridae (Cladocera, Crustacea),
W73-14057 2H

SEDIMENT CONTROL
Depositional Behavior of Cohesive Sediments,
W73-13669 2L

SEDIMENT DISCHARGE
Discharge of Suspended Sediment in the Littoral Zone of the Kakhovka Reservoir,
W73-13691 2J

SEDIMENT DISTRIBUTION
Transport and Deposition of Sediments in Estuaries,
W73-14149 2L

SEDIMENT TRANSPORT
Depositional Behavior of Cohesive Sediments,
W73-13669 2L

Sediment Transport in a Tidal Inlet,
W73-13671 2L

California Coast Nearshore Processes Study, ERTS-A Experiment No. 088,
W73-13681 2L

Discharge of Suspended Sediment in the Littoral Zone of the Kakhovka Reservoir,
W73-13691 2J

Soil Erosion and Transport of Solids by Streams, (Erosion du sol et transports solides des cours d'eau).
W73-13768 2A

Determination of Kennedy's Parameter for Dunes,
W73-13961 2J

Transport and Deposition of Sediments in Estuaries,
W73-14149 2L

SEDIMENTATION
Sediment Transport in a Tidal Inlet,
W73-13671 2L

Soil Erosion and Transport of Solids by Streams, (Erosion du sol et transports solides des cours d'eau).
W73-13768 2A

Status and Trends in Hydrological Forecasts: Part B, Forecasting of Ground Water, Soil Moisture and Sedimentation.
W73-13770 2A

Transport and Deposition of Sediments in Estuaries,
W73-14149 2L

SEDIMENTATION RATES
Radioactivity of Caspian Sea Sediments and Their Deposition Rate (Radioaktivnost' i skorost' obrazovaniya osadkov Kaspiyskogo morya),
W73-13752 2J

SEDIMENTOLOGY
Soil Erosion and Transport of Solids by Streams, (Erosion du sol et transports solides des cours d'eau).
W73-13768 2A

SEDIMENTS
Balance of Reducing Processes in Sediments of the Pacific Ocean (Balans reduktsionnykh protsessov v osadkakh Tikhogo okeana),
W73-13686 2J

Sulfur in Sediments of the Pacific Ocean East of Japan (Sera v tikhookeanskikh osadkakh k vostoku ot Yaponii),
W73-13687 2J

Patterns of Change in Chemical Composition of Iron-Manganese Concretions in Sediments of the Northwestern Part of the Pacific Ocean (Zakonomernosti izmeneniya khimicheskogo sostava zhelezo-margantsevykh konkretsiy v osadkakh severo-z apadnoy chasti Tikhogo okeana),
W73-13688 2J

Iron and Manganese Forms in Sediments of the Northwest Pacific Ocean (Formy zheleza i margantsa v osadkakh severo-zapadnoy chasti Tikhogo okeana),
W73-13689 2J

Radioactivity of Caspian Sea Sediments and Their Deposition Rate (Radioaktivnost' i skorost' obrazovaniya osadkov Kaspiyskogo morya),
W73-13752 2J

Amino Acids in Organic Matter from Suspensions, Water, Sediments, and Pore Solutions in the Black Sea (Aminokislotnyy sostav organicheskogo veshchestva vzvesi, vody, osadkov i gruntovykh rastvorov Chernogo morya),
W73-13756 5B

The Influence of Suspended Sediment on the Surface Reaeration of Uniform Streams,
W73-13817 2J

Relations Among Radionuclide Content and Physical, Chemical, and Mineral Characteristics of Columbia River Sediments,
W73-14114 5A

SEEDS
Larger Seeds of Winterfat Germinate Better,
W73-13996 2I

Rootplowing and Seeding Arid Rangelands in the Southwest,
W73-13998 3F

SEEPAGE
Design of Systematic Drainage with Evaporation and Transpiration,
W73-13693 2D

Seepage Losses and Fertilizer Preservation in Manure Stacking Practice,
W73-13831 5G

SEISMIC STUDIES
Tsunami Waves (Volny tsunami).
W73-13751 2L

SELECTIVITY
Selective Potassium-Sensitive Electrodes Based on Potassium Tetra-P-Chlorophenylborate-Poly (Vinyl Chloride) Sensor Membranes,
W73-14075 5A

SELF-PURIFICATION
Heterotrophic Growth in Indoor Research Channels: Self-Purification and Production,
W73-13726 5C

On the Use of Material Balances for the Assessment of Self-Purification Capacity in Inland Waters, Lake Paijanne as an Example,
W73-13779 5C

SENSITIVITY
Oxygen Toxicity and the Superoxide Dismutase,
W73-14069 5C

SEPARABLE PROGRAMMING
A Ground-Water Planning Model - A Basis for a Data Collection Network,
W73-14176 6A

SEPARATION TECHNIQUES
Method and Apparatus for Removing and Reclaiming Oil-Slick from Water,
W73-13971 5G

Oil Mop and Method of Using Same,
W73-13974 5G

Water-Surface Cleansing Ship,
W73-13977 5G

Process and Apparatus for Containment of Aqueous Pollutants,
W73-13978 5G

Oil Spill Boom,
W73-13979 5G

A Method for the Identification of Branched-Chain Paraffins by Calculation of Their Retention Index Values on the Basis of Molecular Structure and Physical Properties,
W73-14059 5A

Microflora of Soil as Viewed by Freeze-Etching,
W73-14071 5A

SEROTYPES
Identification of Actinomyces, Arachnia, Bacterionema, Rothia, and Propionibacterium Species by Defined Immunofluorescence,
W73-14060 5A

SETTLING BASINS
Liquid Waste Seeps From One Basin to Another.
W73-13845 5D

SEWAGE BACTERIA
Effect of Nutrient Additions on the Apparent Cometabolism of DDT,
W73-14196 5C

SEWAGE DISPOSAL
Land Disposal and Sewage Effluent: Appraisal of Health Effects of Pathogenic Organisms,
W73-14087 5C

SEWAGE EFFLUENTS
Combined Sampling and Flow Measurement,
W73-13708 5A

Physico-Chemical Characteristics of the Municipal Waste Waters of the Great Montreal Area (Quebec) (Caracteristiques physico-chimiques des effluents urbains de l'agglomeration de Montreal (Quebec)),
W73-13991 5B

Chemical Response of Utah Lake to Nutrient Inflow,
W73-14081 5C

SEWAGE FUNGUS
Heterotrophic Growth in Indoor Research Channels: Self-Purification and Production,
W73-13726 5C

SEWAGE TREATMENT
Automatic Control at the Milton Keynes Works,
W73-13787 5D

Experiment Using Biological Ponds for Additional Purification of Sewage Water (In Russian),
W73-13802 5D

Activated Sludge as a Source of Protein,
W73-13832 5D

Sewage Sludge Incorporation in Experimental Field Plots to Evaluate Hazards and Benefits, and Develop Techniques for Optimizing Benefits and Minimize Hazards (Final Environmental Statement).
W73-13860 5D

Package Sewage Treatment Plant,
W73-13976 5D

Purification Equipment at the Izmail Mill: Operating Experience (Ochistnye sooruzheniya na Izmail'skom Kombinate: Opyt ekspluatatsii),
W73-14035 5D

Purification of Effluents from the Manufacture of Constructional Fiberboards (Badania nad unieszkodliwianiem sciekow z produkcji plyt pilsniowych),
W73-14039 5D

Small Town Wastewater Treatment,
W73-14046 5D

SEWERAGE TREATMENT
Final Environmental Impact Statement, Sope Creek Drainage Area, Cobb County, Georgia--Amendment to Environmental Impact Statement, Cobb County Sewerage Improvement Project, July 1971.
W73-13764 5D

SEWERS
Regional Water Supply/Sewage Disposal Plan and Short-Range Program, 1973-1978.
W73-13684 5D

SHEEP
The Fate of Soluble Muchin in the Gastro-Intestinal Tract of Sheep,
W73-13834 5A

Nutritional Interrelationships of Dietary Calcium, Phosphorus, and Magnesium in Sheep,
W73-13853 5B

SHELLFISH
Evaluation of Potential Risk of Botulism from Seafood Cocktails,

STOCHASTIC PROCESSES
Conditional Chance-Constrained Model for Reservoir Control,
W73-13700 4A

International Symposium on Uncertainties in Hydrologic and Water Resource Systems, Vol III.
W73-14166 6A

First-Order Analysis of Model and Parameter Uncertainty,
W73-14180 6A

STORAGE
Uncertainties Resulting From Man-Made Structures,
W73-14174 8A

STORM DRAINS
Urban Storm Drainage and Flood Control in the Denver Region--Final Report
W73-13677 4A

Storm Drainage Plan Study Design.
W73-13683 4A

Storm Drainage and Flood Control Criteria: Objectives, Premises, Principles, Standards
W73-13760 4A

STORM RUNOFF
Storm Drainage Plan Study Design.
W73-13683 4A

STRATIGRAPHY
Structural and Stratigraphic Framework, and Spatial Distribution of Permeability of the Atlantic Coastal Plain, North Carolina to New York,
W73-13666 2F

STREAMFLOW
Hydrologic Reconnaissance of Streams and Springs in Eastern Brooks Range, Alaska--July 1972,
W73-13759 2E

Mathematical Modeling of Streamflow (Matematicheskoye modelirovaniye rechnogo stoka),
W73-14142 2A

Entropy in the Assessment of Uncertainty in Hydrologic Systems Behavior and in Mathematical Model Performance,
W73-14170 6A

STREAMFLOW FORECASTING
Status and Trends in Hydrological Forecasts: Part A, Forecasting of Run-off, River and Lake Level, Ice Conditions and Surface-Water Temperature,
W73-13769 2A

STREAMS
Relation of Channel Slope to Reaeration of Michigan Streams,
W73-14110 5B

STRIP MINE LAKES
Organic Wastes for Acid Strip-Mine Lake Recovery,
W73-13915 5G

STRIP MINES
Strip Mining, An Annotated Bibliography,
W73-13709 5B

Ecological Effects of Strip Mining in Ohio,
W73-13780 5C

STRONTIUM RADIOISOTOPES
The Cycling of Radioactive Sediments (Strontium-90) in the Lakes of Latvian SSR,
W73-13778 5C

STRUCTURAL ANALYSIS
Analysis of Data from Instrumentation Program, Old River Lock,
W73-13678 8A

STRUCTURAL GEOLOGY
Structural and Stratigraphic Framework, and Spatial Distribution of Permeability of the Atlantic Coastal Plain, North Carolina to New York,
W73-13666 2F

STRUCTURES
Uncertainties Resulting From Man-Made Structures,
W73-14174 8A

SUBJECTIVE INPUTS
Subjective Inputs and Uncertainty in Decision Problems,
W73-14177 6A

Intuition, Policy and Mathematical Simulation,
W73-14178 6A

SUBMERGED VEGETATION
Submerged Vegetation of the Rotorua and Waikato Lakes: I 'Cyclic Change' in Lake Rotoiti,
W73-13711 2H

SUBMERGENCE
Investigation of Sinking Methods for Removal of Oil Pollution From Water Surfaces; Report 3. Tests and Evaluation of Oil Sinking Materials,
W73-13696 5G

SUBSTRATE UTILIZATION
Effect of the Chemical Composition of the Medium on the Growth of Chlorella pyrenoidosa,
W73-14076 5C

SUBSURFACE RUNOFF
A Physics-Based Approach to Hydrologic Response Modeling: Phase II: Applications,
W73-13854 2A

SUCCESSION
Saprobic Successions,
W73-13724 5C

Succession: Similarities of Species Turnover Rates,
W73-14073 5C

SULFATE REDUCTION
Organic Wastes for Acid Strip-Mine Lake Recovery,
W73-13915 5G

SULFIDES
Iron Sulfide Concretions in Bottom Sediments of Lake Baykal (Konkretsii sul'fidov zheleza v donnykh osadkakh Baykala),
W73-13753 2J

Determination of the Concentration of Mercaptans and Sulfide Ions in Aqueous Effluents, (Opredelenie kontsentratsii merkaptanov i sul'fid-iona v stochnykh vodakh),
W73-14032 5A

SULFITE LIQUORS
Use of Electrodialysis for Processing Spent Sulfite Liquors (Ispol'zovaniye elektrodializa dlya pererabotki sul'fitnykh shchelokov),
W73-14034 5D

Industrial Land Application Sprayfield Disposal and Wildlife Management Can Coexist,
W73-14056 5D

SULFUR
Sulfur in Sediments of the Pacific Ocean East of Japan (Sera v tikhookeanskikh osadkakh k vostoku ot Yaponii),
W73-13687 2J

ULFUR BACTERIA
pH and Eh Control of Cultures of Sulphate-Reducing Bacteria,
W73-14191 5C

ULFUR COMPOUNDS
Determination of the Concentration of Mercaptans and Sulfide Ions in Aqueous Effluents, (Opredelenie kontsentratsii merkaptanov i sul'fid-iona v stochnykh vodakh),
W73-14032 5A

UPEROXIDE DISMUTASE
Oxygen Toxicity and the Superoxide Dismutase,
W73-14069 5C

UPPLY
Optimizing the Supply of Inland Water Transport,
W73-13968 4A

URF
Kinematics of Water Particle Motion Within the Surf Zone,
W73-14105 2E

Some Kinematic Characteristics of Surf Swash (Nekotoryye cherty kinematiki priboynogo potoka),
W73-14141 2E

URFACE RUNOFF
Characteristics of Cattle Feedlot Surface Runoff,
W73-13833 5B

URFACE WATERS
Appraisal of the Water Resources of Eastern Palm Beach County, Florida,
W73-13675 2E

Water Availability, Clay County, Alabama,
W73-14156 7C

Water Resources of the Upper Wabash River Basin, Northeastern Indiana,
W73-14157 7C

Surface-Water Availability, Franklin County, Alabama,
W73-14159 7C

Reconnaissance of the Water Resources of the Tulsa Quadrangle, Northeastern Oklahoma,
W73-14160 7C

URFACES
Study of Wind-Induced Tidal Oscillations of Sea and Reservoir Surfaces,
W73-13692 2H

URVEYS
Network Planning and Design: Part B, Network Design for Observation of Water Quality, Sediment Transport, Ground Water, and Soil Moisture.
W73-13772 2A

Clean Water -- At What Cost,
W73-14009 5D

Symposium on Significant Results Obtained from Earth Resources Technology Satellite-1, March 5-9, 1973, Volume II Summary of Results.
W73-14126 7B

Review of ERTS-1 Status,
W73-14127 7B

The Earth Resources Program of the Corps of Engineers,
W73-14136 7B

SUSPENDED SOLIDS
Discharge of Suspended Sediment in the Littoral Zone of the Kakhovka Reservoir,
W73-13691 2J

Amino Acids in Organic Matter from Suspensions, Water, Sediments, and Pore Solutions in the Black Sea (Aminokislotnyy sostav organicheskogo veshchestva vzvesi, vody, osadkov i gruntovykh rastvorov Chernogo morya),
W73-13756 5B

The Influence of Suspended Sediment on the Surface Reaeration of Uniform Streams,
W73-13817 2J

SUSPENSION
Interaction and the Suspension of Coarse Particles in a High-Concentration Flow,
W73-13695 8B

SUSQUEHANNA RIVER
Investigation of Environmental Indices from the Earth Resources Technology Satellite, PR 568/MMC 200,
W73-14162 5A

SUSQUEHANNA RIVER BASIN
Water Resource Planning for the Susquehanna River Basin,
W73-13931 6E

SWAMPS
Vegetation Map of Southern Parts of Subareas A and C, Big Cypress Swamp, Florida,
W73-14155 7C

SWEDEN
The Licence System of the Swedish Environment Protection Act as a Means to Overcome Divided Administrative Responsibilities,
W73-13951 6E

Financing Costs of Water Pollution Control in Sweden,
W73-13959
Minicomputer for Regulation and Control of Effluent Discharges (Minidator for styrning och kontroll av avlopp),
W73-14022 5G

Activated Sludge and Trickling Filter Treatment of Effluents at Hallsta Paper Mill,
W73-14040 5D

SWITZERLAND
Purification of Waste Waters of the Forest Products Industry, as Illustrated by Examples From Swiss Mill Operations (Rensing av avlopsvann i treforedlingsindustrien belyst ved eksempler fra sveitsiske bedrifter),
W73-14015 5D

Waste Water Purification at a Sulfite Pulp Mill, Using Cellulose Attisholz Ag. As an Example (Die Abwassers-anierung einer Sulfitzellstoff-Fabrik am Beispiel der Cellulose Attisholz Ag.),
W73-14031 5D

SYNCHRONIZATION
Continuous Culture of Marine Diatoms Under Silicate Limitation. I. Synchronized Life Cycle of Skeletonema Costatum,
W73-14188 5C

SYSTEMATICS
Taxonomy and Ecology of Three New Species of Monodiamsa Kieffer, with Keys to Nearctic and Palaearctic Species of the Genus (Diptera: Chironomidae),
W73-14084 5A

SYSTEMS ENGINEERING
International Symposium on Uncertainties in Hydrologic and Water Resource Systems, Vol III.
W73-14166 6A

A Methodology for Testing System Theoretic Models,
W73-14172 6A

T.C.A.-SOLUBLE MUCIN
The Fate of Soluble Muchin in the Gastro-Intestinal Tract of Sheep,
W73-13834 5A

TAGGING
The Effects of Water Management Practices on the Movement of Largemouth Bass,
W73-13654 2I

TARPON
The Culture and Metamorphosis of the Tarpon, Tarpon Atlanticus Cuvier and Valenciennes,
W73-13794 8I

TARWEED
Soil Properties and Nutrient Availability in Tarweed Communities of Central Washington,
W73-14000 2I

TASTE
Quality Goals for Potable Water.
W73-13785 5G

TECHNOLOGY
Removal of Phosphates in Wastewater by the Periphyton Communities of Rotating Discs,
W73-13725 5D

TELEMETRY
Symposium on Significant Results Obtained from Earth Resources Technology Satellite-1, March 5-9, 1973, Volume II Summary of Results.
W73-14126 7B

Review of ERTS-1 Status,
W73-14127 7B

TEMPERATE
A Preliminary Comparison of the Zooplankton in a Tropical and a Temperate Lake (Lake George, Uganda and Loch Levan, Scotland),
W73-13732 5C

TEMPERATURE
Radiocesium Retention by Rainbow Trout as Affected by Temperature and Weight,
W73-13913 5C

Sensitivity of Vibrio parahaemolyticus to Cold in Oysters, Fish Fillets and Crabmeat,
W73-14072 5C

TENNESSEE
Pesticide Levels in Water and Wildlife of Reelfoot Lake, Tennessee,
W73-13820 5C

Use of Mixed Media in Water Plant Filtration,
W73-14052 6D

TENNESSEE VALLEY AUTHORITY
Programmes of the Tennessee Valley Authority,
W73-13927 6E

TERATOGENICITY
Molybdenum Toxicity: Abnormal Cellular Division of Teratogenic Appearance in Euglena Gracilis,
W73-14197 5C

TESTING
A Methodology for Testing System Theoretic Models,
W73-14172 6A

TETRAHYMENA PYRIFORMIS
Interactions of Tetrahymena pyriformis, Escherichia coli, Azotobacter vinelandii, and Glucose in a Minimal Medium,
W73-14095 5C

TEXAS
Chemical and Physical Characteristics of Water in Estuaries of Texas, October 1969-September 1970,
W73-13679 2L

Annual Compilation and Analysis of Hydrologic Data for Urban Studies in the Austin, Texas Metropolitan Area, 1971,
W73-14111 4C

Trinity Bay Study: Dye Tracing Experiments,
W73-14164 5B

TEXTILES
Treatment of Waste Water from the Cotton Processing Industry (Cisteni adpadnich vod z bavlnarskych kombinatu),
W73-14041 5D

THE NETHERLANDS
Approach Used in the Dutch Delta Plan to Compensate Adversely Affected Interests,
W73-13954 6E

THEORETICAL ANALYSIS
A Methodology for Testing System Theoretic Models,
W73-14172 6A

THERMAL DISCHARGE
An Evaluation of Soil Warming for Increased Crop Production,
W73-13710 5B

THERMAL POLLUTION
Remote Sensing Study of Thermal Discharges to Lake Michigan, Illinois--Indiana-Michigan.
W73-13747 5B

Trinity Bay Study: Dye Tracing Experiments,
W73-14164 5B

THERMAL SPRINGS
Thermal Springs of India and Their Development,
W73-14125 2F

THERMAL WATER
Thermal Springs of India and Their Development,
W73-14125 2F

THIN LAYER CHROMATOGRAPHY
Detection of Naturally Fluorescent Pesticides on Silica Gel Layers,
W73-14058 5A

TIDAL MARSHES
Estimation of Estuarine Marsh Productivity,
W73-14199 5B

TIDAL STREAMS
Studies of Tidal Effects on the River Zuari, Goa,
W73-14119 2E

TIDES
Studies of Tidal Effects on the River Zuari, Goa,
W73-14119 2E

TILES
Monfort Looks at Treated Manure for Tile and Plastic.
W73-13848 5D

TOBACCO YIELD
Yield of Flue-Cured Tobacco and Levels of Soil Oxygen in Lysimeters with Different Water Table Depths,
W73-13908 3F

TOXIC WASTES
Salmon That Need Never See the Sea,
W73-13842 5D

TOXICITY
Evaluation of Potential Risk of Botulism from Seafood Cocktails,
W73-14062 5C

The Selective Toxicity of Antimicrobial Nitroheterocyclic Drugs,
W73-14064 5C

Oxygen Toxicity and the Superoxide Dismutase,
W73-14069 5C

An Improved Bacterial Test System for the Detection and Classification of Mutagens and Carcinogens,
W73-14094 5A

Public Health Aspects of Organics in Water,
W73-14098 5C

Molybdenum Toxicity: Abnormal Cellular Division of Teratogenic Appearance in Euglena Gracilis,
W73-14197 5C

TOXINS
Waste Water Purification Through Catalytic Wet Oxidation (Abwasserklaerung durch katalytische Nassoxydation).
W73-14010 5D

TRACE ELEMENTS
Vertical Distribution of Dissolved Trace Elements in Black Sea Water (O vertikal'nom raspredelenii mikroelementov, rastvorennykh v vode Chernogo morya),
W73-13754 5B

Automated Solvent Extraction for the Determination of Trace Metals in Water by AAS (Atomic Absorption Spectrophotometry),
W73-14047 5A

TRACERS
Transfer of CS-137 From Detritus to Primary Producer,
W73-14183 5B

TRAINING
Waste Water Treatment Facilities, Training Manual.
W73-13672 5D

TRANSFER COEFFICIENTS
Transfer of CS-137 From Detritus to Primary Producer,
W73-14183 5B

TRANSMISSION ELECTRON MICROSCOPY
Microflora of Soil as Viewed by Freeze-Etching,
W73-14071 5A

TRANSPIRATION
Design of Systematic Drainage with Evaporation and Transpiration,
W73-13693 2D

Eco-Physiological Investigations on Wild and Cultivated Plants in the Negev Desert. II. The Influence of Climatic Factors on Carbon Dioxide Exchange and Transpiration at the End of the Dry Period,
W73-13792 2D

TRANSPORTATION
Optimizing the Supply of Inland Water Transport,
W73-13968 4A

TREATIES
The Draft United Nations Convention on the International Seabed Area--Department of Defense Considerations,
W73-13862 6E

TREATMENT
Improving Surface Water Conditions Through Control and Disposal of Aquatic Vegetation, Phase II,
W73-13983 5G

TREATMENT FACILITIES
Final Environmental Impact Statement, Sope Creek Drainage Area, Cobb County, Georgia--Amendment to Environmental Impact Statement, Cobb County Sewerage Improvement Project, July 1971.
W73-13764 5D

Automatic Control at the Milton Keynes Works,
W73-13787 5D

Clean Water -- At What Cost,
W73-14009 5D

Status of Waste Purification in the Finnish Pulp and Paper Industry (A celuloz-es papiripari szennyviztisztitas helyete Finnorszagban),
W73-14013 5D

Active Environmental Protection (Aktiver Umweltschutz).
W73-14029 5D

The Attisholz Experimental Purification Unit (Die Attisholz-Versuchs-Reinigungs-Anlage).
W73-14030 5D

Waste Water Purification at a Sulfite Pulp Mill, Using Cellulose Attisholz Ag. As an Example (Die Abwassers-anierung einer Sulfitzellstoff-Fabrik am Beispiel der Cellulose Attisholz Ag.),
W73-14031 5D

Activated Sludge and Trickling Filter Treatment of Effluents at Hallsta Paper Mill,
W73-14040 5D

Reverse Osmosis Concentration of Spent Liquor Solids in Pressates from High-Density Pulps,
W73-14054 5D

Vari-Nip Press Sludge Dewatering at Container Corporation of America, Fernandina Beach, Florida,
W73-14055 5E

RIAZINE PESTICIDES
The Influence of Simazine on the Photosynthetic Pigments of Green Algae,
W73-13901 5C

RICKLING FILTERS
Activated Sludge and Trickling Filter Treatment of Effluents at Hallsta Paper Mill,
W73-14040 5D

RICLADS
Biota of Freshwater Ecosystems, Identification Manual No. 1, FRESHWATER PLANARIANS TURBELLARIANS) OF NORTH AMERICA,
W73-13736 2I

RINITY BAY (TEX)
Trinity Bay Study: Dye Tracing Experiments,
W73-14164 5B

ROPICAL REGIONS
Seasonal Changes in Water Chemistry of a Tropical Lake (Lago Do Castanho, Amazonia, South America),
W73-13731 5C

A Preliminary Comparison of the Zooplankton in a Tropical and a Temperate Lake (Lake George, Uganda and Loch Levan, Scotland),
W73-13732 5C

ROUT
The Extinction of Fish and Acid Water,
W73-13800 5C

Pipelines and Trout Water,
W73-14048 4C

ROUT DIETS
The Distribution and Life History of South American Freshwater Crabs (Aegla) and Their Role in Trout Streams and Lakes,
W73-13902 8I

SUNAMIS
Maps Showing Areas of Potential Inuncation by Tsunamis in the San Francisco Bay Region, California,
W73-13682 7C

Tsunami Waves (Volny tsunami).
W73-13751 2L

'UCSON (ARIZ)
Price Elasticity of Demand for Municipal Water: A Case Study of Tucson, Arizona,
W73-13698 6D

'ULSA AREA (OKLA)
Reconnaissance of the Water Resources of the Tulsa Quadrangle, Northeastern Oklahoma,
W73-14160 7C

'URBELLARIA
Biota of Freshwater Ecosystems, Identification Manual No. 1, FRESHWATER PLANARIANS TURBELLARIANS) OF NORTH AMERICA,
W73-13736 2I

'URBIDITY
Review of Some Direct Effects of Spoil Dumping on Marine Animals,
W73-13782 5C

Quality Goals for Potable Water.
W73-13785 5G

TURBIDITY CURRENTS
Methods of Calculating Parameters of Turbidity Currents (O metodakh rascheta parametrov suspenzionnykh potokov),
W73-14140 2E

TURBULENCE
Effect of Eutrophication on BOD Testing under Turbulent Conditions,
W73-13909 5A

TURBULENT DIFFUSION
Heat and Water Vapor Exchange Between Water Surface and Atmosphere,
W73-13663 2D

TURBULENT FLOW
The Influence of Suspended Sediment on the Surface Reaeration of Uniform Streams,
W73-13817 2J

TURKMENIA (USSR)
Some Biological Peculiarities in Reservoirs in South Turkmenia,
W73-13730 5C

TURNOVER RATES
Succession: Similarities of Species Turnover Rates,
W73-14073 5C

U.S. ARMY CORPS OF ENGINEERS
The Role of the United States Army Corps of Engineers in Water Management,
W73-13921 6E

UKRAINE
Groundwater Distribution, Karst, and Mudflows in the Carpathian Zone (Zakonomernosti raspredeleniya podzemnykh vod, karst i seli Karpatskoy zony),
W73-14143 2F

Water Vapor Condensation in Thick Low-Humic Chernozems on the Left Bank of the Ukrainian Forest Steppe (O kondensatsii vodyanykh parov v moshchnykh malogumusnykh chernozemakh levoberezhnoy lesostepi USSR),
W73-14147 2G

ULTRASONIC TRACKING
The Effects of Water Management Practices on the Movement of Largemouth Bass,
W73-13654 2I

UNIFORM FLOW
Irrotational Flow With Irregular Boundary Shapes,
W73-13964 8B

UNITED KINGDOM
Procedures Used in the United Kingdom for Integrating Information Needed in Water Management Discussions,
W73-13956 6E

UNITED NATIONS
The Draft United Nations Convention on the International Seabed Area--Department of Defense Considerations,
W73-13862 6E

UNITED STATES
A Bill to Terminate and to Direct the Secretary of the Interior and the Secretary of the Navy to Take Action with Respect to Certain Leases Issued Pursuant to the Outer Continental Shelf Lands Act.
W73-13869 6E

A Bill to Amend the Federal Water Pollution Control Act in Order to Require the Approval of Adjacent Coastal States Prior to the Construction of Certain Offshore Facilities.
W73-13870 6E

A Bill to Prohibit Discharge into any Navigable Waters of any Military without Certification by the Environmental Protection Agency.
W73-13871 6E

A Bill to Amend the Federal Water Pollution Control Act.
W73-13872 6E

United States V. Kennebec Log Driving Company (Log Driving on Navigable River Permitted Under the Rivers and Harbors Act).
W73-13875 6E

United States Ex Rel. Scott V. United States Steel Corp. (Action to Restrain Steel Company from Discharging Waste Water into Lake Michigan).
W73-13876 6E

U.S. V. American Cyanamid Company (Criminal Prosecution for Waste Discharges in Violation of the Refuse Act).
W73-13878 6E

Askew V. American Waterways Operators, Inc. (Constitutionality of Florida's Oil-Spill Prevention and Pollution Control Act).
W73-13879 6E

United States V. Rohm and Haas Company (Action to Enjoin Industrial Discharge into Houston Channel under the Refuse Act).
W73-13881 6E

United States V. Consolidation Coal Company (Injunction to Stop Defendant's Discharge of Wastes into Navigable Waters Under the Refuse Act).
W73-13882 6E

United States Water Policy,
W73-13919 6E

Clean Water -- At What Cost,

SELECTED WATER RESOURCES ABSTRACTS

VOLUME 6, NUMBER 23
DECEMBER 1, 1973

W73-14201 -- W73-14750

SELECTED WATER RESOURCES ABSTRACTS is published semimonthly for the Water Resources Scientific Information Center (WRSIC) by the National Technical Information Service (NTIS), U.S. Department of Commerce. NTIS was established September 2, 1970, as a new primary operating unit under the Assistant Secretary of Commerce for Science and Technology to improve public access to the many products and services of the Department. Information services for Federal scientific and technical report literature previously provided by the Clearinghouse for Federal Scientific and Technical Information are now provided by NTIS.

SELECTED WATER RESOURCES ABSTRACTS is available to Federal agencies, contractors, or grantees in water resources upon request to: Manager, Water Resources Scientific Information Center, Office of Water Resources Research, U.S. Department of the Interior, Washington, D. C. 20240.

SELECTED WATER RESOURCES ABSTRACTS is also available on subscription from the National Technical Information Service. Annual subscription is $45 (domestic), $56.25 (foreign). Certain documents abstracted in this journal can be purchased from the NTIS at prices indicated in the entry. Prepayment is required.

SELECTED
WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center,
Office of Water Resources Research, U.S. Department of the Interior

VOLUME 6, NUMBER 23
DECEMBER 1, 1973

W73-14201 -- W73-14750

The Secretary of the U. S. Department of the Interior has determined that the publication of this periodical is necessary in the transaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through August 31, 1978.

As the Nation's principal conservation agency, the Department of the Interior has basic responsibilities for water, fish, wildlife, mineral, land, park, and recreational resources. Indian and Territorial affairs are other major concerns of America's "Department of Natural Resources."

The Department works to assure the wisest choice in managing all our resources so each will make its full contribution to a better United States—now and in the future.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifiers which are listed in the **Water Resources Thesaurus.** Each abstract entry is classified into ten fields and sixty groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT PRESENTLY IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

Additional "centers of competence" have been established in cooperation with the Environmental Protection Agency. A directory of the Centers appears on inside back cover.

Supplementary documentation is being secured from established discipline-oriented abstracting and indexing services. Currently an arrangement is in effect whereby the BioScience Information Service of Biological Abstracts supplies WRSIC with relevant references from the several subject areas of interest to our users. In addition to Biological Abstracts, references are acquired from Bioresearch Index which are without abstracts and therefore also appear abstractless in SWRA. Similar arrangements with other producers of abstracts are contemplated as planned augmentation of the information base.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Resources Research and other Federal water resources agencies with which the

Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangements of this bulletin are welcome.

FOREWORD_____iii

SUBJECT FIELDS AND GROUPS

(Use Edge Index on back cover to Locate Subject Fields and Indexes in the journal.)

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Non-Water Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

DECISIONS WITH INADEQUATE HYDROLOGIC DATA.

Proceedings of 2nd International Symposium in Hydrology, September 1972, Fort Collins, Colorado, D. A. Woolhiser, editor: Water Resources Publications, Fort Collins, 1973. 290 p.

Descriptors: *Hydrologic data, *Data collections, *Decision making, Systems analysis, Cost-benefit analysis, Floods, Droughts, Reservoir design, Network design, Project planning, Water management.
Identifiers: *Inadequate hydrologic data.

There is a fundamental conflict of interest between the data gatherer and the water resource system designer and builder. The data expert wishes to improve the accuracy of his product which may require more years of observations with more accurate equipment. The designer and builder wish to get on with their work. In many circumstances the data are clearly inadequate. If there are no budget constraints one should gather data until the marginal cost of the data is equal to the marginal benefits attributable to the data. As a practical matter this point is very difficult to find because of uncertainties in the benefits. Papers of this Symposium are classified in three major groups: (1) network design and regional studies, (2) rainfall and runoff simulation, and (3) reservoir system analysis. W73-14550

AN ECONOMIC APPROACH FOR EVALUATING THE ADEQUACY OF HYDROLOGIC DATA,
Queen's Univ., Kingston (Ontario).
W. E. Watt, and K. C. Wilson.
In: Decisions with Inadequate Hydrologic Data; Proceedings of 2nd International Symposium in Hydrology, September 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 7-16, 1973. 1 fig, 5 ref.

Descriptors: *Data collections, *Network design, *Economics, *Cost-benefit analysis, Project planning, Decision making, Gages, Instrumentation, Hydrologic data, Water measurement, Stream gages, Rain gages, Precipitation gages.
Identifiers: *Inadequate hydrologic data.

Hydrologic data can be considered adequate when the marginal cost associated with improving the data is just equal to the marginal benefit resulting from such an improvement. This concept can be applied to decisionmaking in planning regional hydrometric networks. In this case, the cost of improving the data accuracy is equal to the cost of increasing and operating the network. A logical approach to the determination of marginal benefit-error of prediction is proposed. An expression is derived which relates the relative increase in cost of adopting a design different from the optimum to the error of prediction. This expression involves a capital cost exponent, a damage cost exponent, and a flood (or drought) frequency exponent; each exponent is defined by an average regional value. Application of this expression to the total future investment for a region yields the marginal benefit relation, which when combined with a marginal cost relation, can provide an objective basis for decisionmaking in the area of hydrometric network planning. W73-14551

DESIGN OF HYDROMETRICAL NETWORKS AND APPLICATION TO COLOMBIA,
World Meteorological Organization, Bogota (Colombia).
S. Stanescu, and W. Klohn.
In: Decisions with Inadequate Hydrologic Data; Proceedings of 2nd International Symposium in Hydrology, September 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 17-28. 1973. 2 fig, 17 ref.

Descriptors: *Data collections, *Network design, *Economics, *Cost-benefit analysis, Project planning, Decision making, Gages, Instrumentation, Hydrologic data, Water measurement, Stream gages, Rain gages, Precipitation gages.
Identifiers: *Inadequate hydrologic data, *Colombia.

In 1968, Colombia began to organize a national hydrological service. One of the main tasks of this new activity was the design of stream-gaging networks. In the siting of stations within its hydrological data system, the Colombian service faced three alternatives: (a) siting according to water use projects; (b) establishment of a minimal national network of basic stations; and (c) establishment of an optimal national network. Considering the existing facilities and the funds available, (b) was the alternative chosen. In the distribution of the stations, the predominant criterion was the establishment of a network that would yield indirect basic information for any point in the territory by regression of measured data with genetic factors of the hydrological regime. (See also W73-14550) (Knapp-USGS)
W73-14552

AN APPLICATION OF THE INADEQUATE HYDROLOGICAL DATA OF THE AFRICAN TROPICAL REGIONS IN ENGINEERING DESIGN,
National Council for Scientific Research, Lusaka (Zambia).
J. Balek.
In: Decisions with Inadequate Hydrologic Data; Proceedings of 2nd International Symposium in Hydrology, September 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 29-39, 1973. 4 fig, 1 tab, 7 ref.

Descriptors: *Data collections, *Network design, *Economics, *Cost-benefit analysis, Project planning, Decision making, Gages, Instrumentation, Hydrologic data, Water measurement, Stream gages, Rain gages, Precipitation gages.
Identifiers: *Inadequate hydrologic data, *Zambia.

Hydrological data available in African tropical regions usually consist of long precipitation records, rather short water level and discharge records and very short data for small, separated experimental catchments. No data from nearby, intensively observed basins are usually available. In most cases, where the extension of the existing network and improvement of the quality of the records is not technically possible, at least a system of representative/experimental catchments within a main basin should be established, supplying the data and information on those regionally specific phenomena which cannot be transferred from experiments in the catchments of developed countries. In most cases the influence of vegetation, morphology, and soil types on the hydrological cycle should be investigated. Intensive field surveys particularly during the occurrence of extremes, together with the tracing of historical records, can supply valuable additional information. (See also W73-14550) (Knapp-USGS)
W73-14553

SHORT DURATION RAINFALL DEPTH-DURATION-FREQUENCY MAP OF INDIA,
Assam State Electricity Board, Barapani (India).
A. C. Goswami.
In: Decisions with Inadequate Hydrologic Data; Proceedings of 2nd International Symposium in Hydrology, September 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 48-56, 1973. 6 fig, 11 ref.

Descriptors: *Depth-area-duration analysis, *Data collections, *Frequency analysis, Statistical methods, Duration curves, Hydrologic data.
Identifiers: *India, *Inadequate hydrologic data.

Short duration rainfall data are extremely scarce in developing countries like India. Thus short duration rainfall data for India are developed on the basis of rainfall relationships of other countries. The analysis is concerned only with durations of 2 hours or less, and all data are for point rainfall. U.S.A. rainfall ratios were used to develop the depth-duration-frequency maps of India from the 2 year, 24-hr rainfall isopleth map of India. (See also W73-14550) (Knapp-USGS)
W73-14555

COMPUTATIONS OF PEAK FLOODS WITH INADEQUATE HYDROLOGIC DATA,
Columbia Univ., New York.
G. J. Halasi-Kun.
In: Decisions with Inadequate Hydrologic Data; Poroceedings of 2nd International Symposium in Hydrology, September 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 57-73, 1973. 6 fig, 12 ref.

Descriptors: *Peak discharge, *Rainfall-runoff relationships, *Hydrogeology, *New Jersey, Urbanization, Flood forecasting, Data collections, Surface-groundwater relationships, Lakes, Swamps, Forests, Floods, Hydrologic data.
Identifiers: *Inadequate hydrologic data.

A detailed investigation of the 100-year peak flood flow in New Jersey from areas less than 100 sq mi was based on the study of the hydroegology of the area. The results are compared with peak flood flow equations from Central Europe and the United States. From evaluation of point rainfall intensity and hydrogeologic qualities, diagrams and a basic runoff formula are developed for New Jersey. The entire State is divided into 10 hydrogeologic regions. Local corrections of the formula are established for the influence of lakes, swamps, wooded areas, shape of the watershed, and urbanization upon the 100-year peak runoff. (See also W73-14550) (Knapp-USGS)
W73-14556

DETERMINATION OF SOME HYDROLOGICAL FACTORS WITH A WELL RECORDER,
Ain Shams Univ., Cairo (Egypt).
M. M. Soliman.

In: Decisions with Inadequate Hydrologic Data; Proceedings of 2nd International Symposium in Hydrology, September 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 74-79, 1973. 2 fig, 1 tab, 3 ref.

Descriptors: *Storage coefficient, *Groundwater movement, *Aquifer testing, Drawdown, Data collestions, Water level fluctuations, Aquifer characteristics, Transmissivity, Hydrologic data.
Identifiers: *Inadequate hydrologic data.

A new equation is presented to obtain storativity of an aquifer with the help of recorder readings. A confined aquifer is replenished from a remote source such as a lake or a river. A well is located at some distance from the replenishing source and completely penetrates the aquifer. The water-level recorder in a single well is a substitute for observation wells. Piezometric groundwater contours are also essential for this method. Pumping tests from the single well should be carried out to get the aquifer transmissivity before establishing a water level recorder. (See also W73-14550) (Knapp-USGS)
W73-14557

THE USE OF TRACER DATA IN INCREASING THE INFORMATION ON HYDROLOGIC SYSTEMS,
Weizmann Inst. of Science, Rehovot (Israel). Isotope Dept.
A. Nir.
In: Decisions with Inadequate Hydrologic Data; Proceedings of 2nd International Symposium in Hydrology, September 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 80-87, 1973. 2 fig, 19 ref.

Descriptors: *Tracers, *Hydrologic cycle, Hydrogeology, Tritium, Carbon radioisotopes, Deuterium, Runoff, Stable isotopes, Oxygen isotopes, Streamflow, Hydrologic data, Groundwater movement, Data collections.
Identifiers: *Inadequate hydrologic data.

A review of tracer methods and new results in the field of stochastic treatment of tracer data is presented and evaluated in terms of additional information gained in hydrologic systems. Their contributions are in: (a) determination of specific hydrologic parameters; (b) confirmation or elimination of assumed models; (c) extension of hydrological data as used in system analysis; (d) formation of a connecting linkbetween system analysis and physical hydrology; and (e) supply of preliminary information on regional hydrological systems in the absence of hydrologic data. Examples of these uses are given. (See also W73-14550) (Knapp-USGS)
W73-14558

CONCEPT OF A TECHNIQUE FOR AN ANALYSIS OF WATERSHED RUNOFF EVENTS,
Agricultural Research Service, Riesel, Tex. Soil and Water Research Div.
J. R. Williams.
In: Decisions with Inadequate Hydrologic Data; Proceedings of 2nd International Symposium in Hydrology, September 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 111-120, 1973. 4 fig, 8 ref.

Descriptors: *Rainfall-runoff relationships, *Hydrograph analysis, Unit hydrographs, Computers, Optimization, Data collections, Hydrologic data, Flood forecasting.
Identifiers: *Inadequate hydrologic data.

An optimization technique computes hydrologic variables that cannot be measured directly. Measured rainfall rates and storm hydrographs are used to compute unit hydrograph shapes and associated source runoff from complex storms. Optimized unit hydrographs vary considerably for different storms on the same watershed. These computed unit hydrographs can be used to develop relationships between unit hydrograph shape parameters and storm and watershed characteristics. The computed incremental source runoff can be used to develop and test infiltration equations for watersheds. Such equations should be more accurate in predicting source runoff from watersheds than equations developed with infiltrometer data. The optimization technique is efficient, as it will fit most storm hydrographs accurately with a moderate amount of computer time. (See also W73-14550) (Knapp-USGS)
W73-14559

EXPERIENCE WITH A MONTHLY RAINFALL--RUNOFF TRANSFER FUNCTION MODEL,
Lahmeyer International G.m.b.H., Frankfurt am Main (West Germany).
F. Fahlbusch, and T. C. Muir
In: Decisions with Inadequate Hydrologic Data; Proceedings of 2nd International Symposium in Hydrology, September 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 121-131, 1973. 4 fig, 2 tab, 11 ref.

Descriptors: *Rainfall-runoff relationships, *Mathematical models, Optimization, Computers, Parametric hydrology, Systems analysis, Water storage, Data collections, Hydrologic data.
Identifiers: *Inadequate hydrologic data

A monthly rainfall-runoff model can be used for the determination of synthetic long-term sequences from synthetic or observed rainfall sequences on catchments for which only limited runoff data are available. A transfer function of an exponential decay type is used in a linear model linking rainfall as imput and runoff as output. A modification of the model to include the effects of nonlinearity is proposed. Results of the application of both the linear and nonlinear models to five rivers are presented. (See also W73-14550) (Knapp-USGS)
W73-14560

THE USE OF EVOP AS A HYDROLOGIC TOOL,
British Columbia Univ., Vancouver. Dept. of Civil Engineering.
R. Y. McNeil, and S. O. Russell.
In: Decisions with Inadequate Hydrologic Data; Proceedings of 2nd International Symposium in Hydrology, September 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 132-142, 1973. 2 fig, 1 tab, 1 ref.

Descriptors: *Mathematical models, *Optimization, Computer programs, Systems analysis, Data collections, Hydrologic cycle, Hydrologic data, Water balance.
Identifiers: *Inadequate hydrologic data.

Practicing hydrologists are often faced with the problem of making decisions on the basis of inadequate data. Simple hydrologic models offer one way of making the most of the available data and at the same time lend themselves to sensitivity analysis. Evolutionary Operation (EVOP), developed as a practical method for improving the operation of chemical plants, can be adapted and used as a technique for optimization of hydrologic models. The basis of EVOP is that factorial experiments are run and results are displayed in a special format which is readily comprehensible to the operator, allowing him to improve his operation, while keeping in full control. When used with hydrologic models the same advantages apply, and the hydrologist can keep fully in control of his model at all times. EVOP allows several objectives to be considered simultaneously. Thus by carefully choosing the error indicators, it can be used as a diagnostic as well as an optimization tool. EVOP allows the parameters in any hydrologic model to be quickly optimized and the model thus pushed to its limit. (See also W73-14550) (Knapp-USGS)
W73-14561

A SIMULATION TECHNIQUE OF MONTHLY RUNOFF BY USE OF PRECIPITATION TIME SERIES AT MULTISTATIONS,
Hokkaido Univ., Sapporo (Japan). Dept of Civil Engineering.
K. Hoshi, and I. Yamaoka
In: Decisions with Inadequate Hydrologic Data; Proceedings of 2nd International Symposium in Hydrology, September 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 143-153, 1973. 1 fig, 4 tab, 3 ref.

Descriptors: *Simulation analysis, *Time series analysis, *Stochastic processes, Data collections, Mathematical models, Hydrologic data, Rainfall-runoff relationships, Statistics, Variability, Statistical models
Identifiers: *Inadequate hydrologic data

The application of simulation techniques is particularly valuable as water resources planning problems become more complex. However, one of the difficulties encountered in practice is that in many cases decisions regarding water resources developments must be based on inadequate data both in time and in space. To overcome this situation, multivariate statistical procedures are based on stochastic processes consisting of both deterministic components and random components. Some procedures discussed are simultaneous generation of monthly precipitation at several satellite stations from a key station; determination of areal precipitation for a specified month as the actual inputs to the runoff system; simultaneous generation of monthly runoff at given stations with incorporation of areal precipitation to improve the simulation models; and adoption of matrix representation, which is a very useful strategy for evaluating the complex interrelationships of spatial and temporal variations of hydrologic events in watershed models and for minimizing stochastic random components. (See also W73-14550) (Knapp-USGS)
W73-14562

ON THE USE OF SHORT-TERM DATA FOR STREAMFLOW SYNTHESIS,
Pittsburgh Univ., Pa. Dept. of Civil Engineering.
R. G. Quimpo.
In: Decisions with Inadequate Hydrologic Data; Proceedings of 2nd International Symposium in Hydrology, September 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 154-160, 1973. 2 fig, 15 ref.

Descriptors: *Mathematical models, *Statistical models, *Rainfall-runoff relationships, Parametric hydrology, Synthetic hydrology, Stochastic processes, Data collections, Hydrologic data, Markov processes.
Identifiers: *Inadequate hydrologic data.

The generation of streamflow sequences from which the distribution of design variables in water resources planning are determined requires the estimation of stochastic parameters from relatively long hydrologic records. When hydrologic data are inadequate, a possible alternative is to make use of the relation between parametric and stochastic models to deduce parameters from short-term rainfall-runoff events. Using basin storage properties as common determinants characterizing both models, a scheme is outlined whereby information from short duration hydrographs may be employed to obtain a model for generating streamflows. The concepts may be applied to both Markov and non-Markov models. (See also W73-14550) (Knapp-USGS)
W73-14563

A SIMILAR STORM METHOD ON FILLING DATA VOIDS,
Tokushima Univ., (Japan). Dept. of Engineering.
M. Hashino.
In: Decisions with Inadequate Hydrologic Data; Proceedings of 2nd International Symposium in Hydrology, September 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 161-173, 1973. 6 fig, 2 tab, 1 ref.

Descriptors: *Hydrologic data, *Rainfall, *Storms, Regression analysis, Statistical methods, Rain gages, Data collections.
Identifiers: *Inadequate hydrologic data, Similar storm.

The concept of 'similar storm' is introduced for estimation of missing rainfall sequences on the assumption that storms missing in the record exist as 'historic storms'. A group of gaging sites, which have similar rainfall characteristics, is selected to include a given site with storm data voids. The most similar storm to a given void storm at the site is selected on the basis of coefficient matrices of areal cross-correlation obtained from historic rainfall data of many storms. It is necessary that the rainfall sequences of the storm considered be perfectly observed at several sites of the selected gaging group except the site concerned. The rainfall sequence of the void storm at the given site is obtained from linear regression analysis using the similar storm and the partial void storm. (See also W73-14550) (Knapp-USGS)
W73-14564

ANALYSIS OF MONTHLY RAINFALL PROBABILITIES BY WEIGHTED TRANSFORMATION,
Engineering Consultants, Inc., Denver, Colo.
Y. Au-Yeung.
In: Decisions with Inadequate Hydrologic Data; Proceedings of 2nd International Symposium in Hydrology, September 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 174-181, 1973. 4 fig, 4 tab, 2 ref.

Descriptors: *Rainfall, *Probability, Statistical methods, Data collections, Hydrologic data, Distribution patterns.
Identifiers: *Inadequate hydrologic data.

Reliable rainfall probability estimates are essential for irrigation project planning and decisionmaking, especially where data are inadequate or limited. A simple and versatile method for analyzing monthly rainfall probability uses a combination of three types of data transformation and the mixed distribution method to transform monthly rainfall data. The three types of data transformation are normal, log-normal, and square-root. Application of the method is shown in an example using the monthly rainfall data of Kabinburi Weather Station in Thailand. Results indicate that a best fit distribution for the observed monthly rainfall data can easily be obtained. (See also W73-14550) (Knapp-USGS)
W73-14565

EVALUATION OF MULTIANNUAL FIRM HYDROELECTRIC POWER--A NEW METHOD,
Hidrotecnica Portuguesa, Lisbon. Dept. of Civil Engineering.
A. A. Manzanares, J. Santos, and L. V. Tavares.
In: Decisions with Inadequate Hydrologic Data; Proceedings of 2nd International Symposium in Hydrology, September 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 205-209, 1973. 2 ref.

Descriptors: *Water yield, *Reservoir yield, *Safe yield, *Time series analysis, System analysis, Regulation, Water storage, Hydroelectric power, Data collections, Hydrologic data.
Identifiers: *Inadequate hydrologic data.

A method is presented to evaluate the firm power produced by complex hydroelectric systems with large multiannual reservoirs. If the known sample of annual energetic inflows is scarce and the guarantee is defined over a long period, this method is preferable to those currently used. Instead of studying the accumulated annual inflows, the series of multiannual inflows is analyzed. Monte Carlo techniques are used to estimate variables with small variances. (See also W73-14550) (Knapp-USGS)
W73-14566

INADEQUATE HYDROLOGIC DATA AND RESERVOIR CAPACITY,
Monash Univ., Clayton (Australia). Dept. of Civil Engineering.
T. A. McMahon, and G. P. Codner.
In: Decisions with Inadequate Hydrologic Data; Proceedings of 2nd International Symposium in Hydrology, September 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 210-219, 1973. 5 tab, 11 ref.

Descriptors: *Reservoir storage, *Streamflow forecasting, *Data collections, Statistical methods, Probability, Hydrologic data, Time series analysis, Distribution patterns, Statistical models.
Identifiers: *Inadequate hydrologic data.

Inadequate streamflow data result from measurement errors and shortness of record. Sampling errors which follow from inadequate data are examined for their effect on streamflow generation models and storage analysis. The effect on storage estimates of assuming different inflow idstributions is also considered. The comparative significance of absolute errors resulting from inadequate specification of means, skews, and serial correlations is also discussed. In general, 36 years of record is adequate. For the distribution study, two- and three-parameter log-normal models, a log transformed data model, and one based on the historical distribution of the random component were compared on the basis of replicated flow parameters and storage estimates. No distribution produced satisfactory results for all rivers. Preservation of the mean flow is more important that the serial correlation. Because of the effect of implied skew, care should be taken in using the two-parameter log-normal distribution in data generation models. (See also W73-14550) (Knapp-USGS)
W73-14567

EFFECTS OF INADEQUACE OF HYDROLOGIC DATA ON RELIABILITY OF WATER RESOURCES DESIGN,
Osaka Univ. (Japan). Dept. of Civil Engineering.
A. Murota, and T. Eto.
In: Decisions with Inadequate Hydrologic Data; Proceedings of 2nd International Symposium in Hydrology, September 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 220-237, 1973. 9 fig, 1 tab, 1 ref.

Descriptors: *Data collections, *Hydrologic data, *Reservoir design, Systems analysis, Safe yield, Streamflow forecasting, Hydrograph analysis, Simulation analysis.
Identifiers: *Inadequate hydrologic data.

Inadequacy of hydrologic data severely effects the reliability of design. An approximate method for calculating a linear reservoir system equivalent to a general reservoir system is given. The proposed method of linearization may simplify the analytical treatment of the reservoir system and make analytical studies of the total system possible, while maintaining qualitative behavior of the actual reservoir system. Gross shortage of water through the observation period was evaluated. An equation was deduced to represent the relation between the shortage and sample size, mean, standard deviation and autocorrelation coefficient of natural discharge sequences, the capacity of the reservoir, and the target draft. By using the equation and simulation, effects of error in observation and sample size of discharge data on reliability of a water resources design were investigated. (See also W73-14550) (Knapp-USGS)

EVALUATION OF DROUGHT EFFECTS AT LAKE ATITLAN,
Hydrologic Engineering Center, Davis, Calif.
A. D. Feldman.
In: Decisions with Inadequate Hydrologic Data; Proceedings of 2nd International Symposium in Hydrology, September 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 238-251, 1973. 1 fig, 3 tab, 6 ref.

Descriptors: *Water balance, *Reservoir evaporation, *Reservoir yield, *Hydrologic data, Data collections, Mathematical models, Simulation analysis, Synthetic hydrology, Water level fluctuations.
Identifiers: *Inadequate hydrologic data, *Lake Atitlan (Guatemala).

Guatemala's Lake Atitlan is a natural sink for a small watershed which lies in the central highlands adjacent to the Pacific coastal plain. Guatemala plans to develop hydropower from this lake by tunneling through the southern boundary of the lake to develop head down the coastal slope. Streamflows from nearby basins will be diverted into the lake to replace lake water used for hydropower. Limited data are available for streamflow, precipitation, and lake surface elevations, but there is no lake evaporation or seepage. The lake elevation record is 25 years long, while precipitation and streamflow data in the study area range from 1 to 9 years. In order to simulate the operation of the lake during the historical period, it was necessary to estimate the natural water balance of the lake as well as the missing records of the streamflows at the diversion sites. Because of the lack of evaporation and seepage data, changes in lake storage as reflected by changes in lake elevation were used to represent the natural water balance of the lake. The missing streamflow records could be reconstructed using the change in the lake elevation. (See also W73-14550) (Knapp-USGS)

THE HYDROLOGICAL FEASIBILITY OF VARIABLE WATER SUPPLY POLICIES,
Tahal Consulting Engineers Ltd., Tel-Aviv (Israel). Research and Development Div.
J. Bargur, and M. Gablinger.
In: Decisions with Inadequate Hydrologic Data; Proceedings of 2nd International Symposium in Hydrology, September 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 252-265, 1973. 3 fig, 10 ref.

Descriptors: *Water supply, *Variability, *Water resources development, Linear programming, Mathematical models, Simulation analysis, Water policy, Data collections, Water management (Applied), Water yield, Hydrologic data.
Identifiers: *Inadequate hydrologic data, *Israel.

In regions where scarcity of water resources is increasing and thus marginal quantities of water are becoming more important, it seems possible to increase the long-run regional water potential by establishing a variable water supply policy. To study this policy, a combination of linear programming and siumlation models was applied in a two-stage program. The hydrological feasibility of variable water supply policies was tested using the Israel water supply system as a case study. Under a variable supply policy the average annual allocation can be increased by more than 10% and the stipulated allocation can be met 98% of the time. (See also W73-14550) (Knapp-USGS)

WATER BALANCE IN EUROPE (VODNYY BALANS YEVROPY),
Akademiya Nauk SSSR, Moscow. Institut Geografii.
G. M. Chernogayeva.
Izdatel'stvo Vsesoyuznyy Institut Nauchnoy i Technicheskoy Informatsii, Moscow, 1971. 140 p.

Descriptors: *Europe, *Water balance, *Water resources, Hydrologic cycle, Precipitation (Atmospheric), Evaporation, Runoff, Surface runoff, Subsurface runoff, Groundwater, Soil water, Glaciers, Mountains, Hydrographs, Sea level, Elevation, Maps, Equations, Estimating, Investigations.
Identifiers: USSR, Alps.

This monograph is the second in a series of publications on continental water balances and was prepared by the Department of Hydrology of the USSR Academy of Science's Institute of Geography. A method developed at the Institute for water-balance studies is based on solution of a system of differentiated equations characterizing the lithogenic component of the hydrologic cycle, including groundwater and soil water. Maps are compiled for total river runoff, subsurface and surface runoff, evaporation, and total moisture, and relations are established between water-balance items and sea-level elevation for different regions in the Alps. Balance estimates are given of water resources for each European country and for economic regions in the European part of the USSR. (Josefson-USGS)

IS THERE AMPLE FRESHWATER ON EARTH, (MNOGO LI PRESNOY VODY NA ZEMLE),
Akademiya Nauk SSSR, Moscow. Institut Geografii.
M. I. Lvovich.
Priroda, No 5, p 7-17, 1973. 8 fig, 1 tab.

Descriptors: *Freshwater, *Water resources, *Water balance, *Hydrologic cycle, Precipitation (Atmospheric), Runoff, Subsurface runoff, Surface runoff, Soil water, Evaporation, Water sources, Geographical regions, Africa, Maps, Equations.
Identifiers: *USSR, Hydrosphere, Water exchange.

The hydrologic cycle has provided man with abundant freshwater resources, although natural conditions in certain regions have produced acute water shortages. Moreover, improper use of water has led to pollution of streams and other water bodies. Revamping of principles and approaches toward use and conservation of water will solve the problem of the world's water supply. Relations of evaporation and subsurface runoff to total soil moisture for the USSR and of total runoff to precipitation for Africa and graphed; water balance and freshwater resources of continents are tabulated; and total runoff, subsurface runoff, surface runoff, total soil moisture, and evaporation of world land areas are mapped. (Josefson-USGS)

THEORETICAL ANALYSIS OF THE ROLE OF SUBSURFACE FLOW IN THE GENERATION OF SURFACE RUNOFF: 2. UPSTREAM SOURCE AREAS,
IBM Watson Research Center, Yorktown Heights, N.Y.
R. A. Freeze.
IBM Research Report RC 3795, March 22, 1972. 32 p, 11 fig, 25 ref. OWRR C-3144 (No 3694) (4).

Descriptors: *Subsurface runoff, *Streamflow, *Groundwater movement, *Rainfall-runoff relationships, *Hydraulic models, Hydrologic data, Correlation analysis, Theoretical analysis, Mathematical studies, Environmental effects, Topography, Geomorphology, Soil types, Overland flow, Infiltration, Inflow, Hydrogeology, Base flow, Unsaturated flow, Saturated flow

Runoff simulations for hypothetical upstream source areas, carried out with a deterministic mathematical model that couples channel flow and saturated-unsaturated subsurface flow, provide theoretical support for the runoff-generating mechanisms observed in the field by Ragan (1968) and Dunne (1970). The simulations show that there are stringent limitations on the occurrence of subsurface stormflow as a quantitatively-significant runoff component. It is a feasible mechanism only on convex hillslopes that feed deeply-incised channels, and then only when saturated soil conductivities are very large. On concave slopes with lower permeabilities, and on all convex slopes, hydrographs are dominated by direct runoff via very short overland flow paths from precipitation on transient, near-channel wetlands. On these wetlands, surface saturation occurs from below due to rising water tables that are fed by vertical infiltration rather than by lateral subsurface flow. Classic Hortonian overland flow is a rare occurrence in time and space. These conclusions have implications in the planning of field instrumentation networks, and in the design of hydrologic response models. (See also W72-10905 and W73-00668) (Woodard-USGS)

HIGH YIELD FROM THE BULL RUN WATERSHED,
British Columbia Dept. of Municipal Affairs, Victoria. Environmental Planning and Management Div.
L. V. Luchin.
Journal of the American Water Works Association, Vol 65, No 7, p 183-186, March 1973. 2 tab.

Descriptors: Water balance, *Runoff, *Watersheds (Divides), *Watershed management, *Evapotranspiration control, Precipitation (Atmospheric), Evapotranspiration, Soil moisture, Evaporation, Water yield, *Oregon.
Identifiers: *Bull Run Watershed (Ore), Interception Loss, Mount Hood National Forest.

A water balance equation was used for calculating the amount of runoff in the Bull Run watershed in Mt. Hood National Forest, about 25 miles east of Portland, Oregon. Calculated runoff was then compared with measured runoff. Calculated runoff was 84.22 inches annually, while measured runoff was 102.56 inches - 20% higher than expected. The difference of about 18 inches is explained partly as up to 9 inches of calculation error, and partly as water seepage into the Bull Run watershed from adjoining basins. Porous bedrock underlying the area and measurements on three small tributaries support the latter conclusion. The excess of measured runoff over calculated runoff led to the conclusion that Bull Run was a 'high-yield' watershed. The equation for computing runoff is X±a-b-c-d-e, where X± calculated generated water, a ± gross or measured precipitation, b ± interception loss, c ± evapotranspiration loss, d ± soil moisture storage change, and e ± evaporation from free water surfaces. Limited deforestation is suggested as a means of increasing water yield, but reservations are expressed about impact of deforestation on other watershed resources. (Stein-North Carolina)

STUDY OF URBAN EFFECTS ON PRECIPITATION AT ST. LOUIS,
Illinois State Water Survey, Urbana.
S. A. Changnon Jr.
April 1973. 34 p, 17 fig, 10 tab, 11 ref. NSF GI-33371.

Descriptors: *Weather, *Urbanization, *Environmental effects, Weather modification, Weather patterns, Missouri, Data collection, Weather forecasting.
Identifiers: *St. Louis (Missouri).

The effects of an urban environment on climate were studied at St. Louis, Missouri. The study centered on 14 goals, including: (1) a study of surface rainfall and severe weather to define their time and space distribution and delineate any anomalies, (2) the investigation of low level airflow and circulation patterns, (3) urban water quality, (4) synoptic weather analyses, (5) definition of the causes of anomalies, (6) local and regional planning incorporating man-made weather changes, (7) improvements in local weather forecasting, (8) air pollution studies, (9) planning for weather modification, (10) relevance of weather anomalies to water resources, hydrologic designs, agriculture, ecology and business, and (11) transfer of knowledge and technology to other disciplines. The results are presented of the previous year's activities for each of the goals supported by the National Science Foundation. Significant influences of the urban environment on weather patterns were discovered. (Poertner)

NOTE ON THE KINETIC ENERGY SPECTRUM OF COASTAL WINDS,
Oregon State Univ., Corvallis. Dept of Oceanography.
D. E. Frye, S. Pond, and W. P. Elliott.
Monthly Weather Review, Vol 100, No 9, p 671-673, September 1972. 2 fig, 7 ref. ONR N00014-67-A-0369-0007.

Descriptors: *Coasts, *Winds, *Sea breezes, *Land breezes, Climates, Kinetics, *Oregon.
Identifiers: Power density spectrum, Land-sea temperature differences, *Kinetic energy (Winds).

This study was conducted to determine if the power density spectrum of coastal winds contained the same spectral gap, where there is very little eddy kinetic energy, as has been found in some localities. An examination of the spectrum of winds along the Oregon coast shows a major diurnal peak at a period of 24 hr and a small microscale peak at about 50 hrs. The 24-hr peak is thought to be associated with the diurnal variation of land-sea temperature difference. (Sinha - OEIS)

THE PHYSICAL MEANING OF TWO-DIMENSIONAL STRESSES IN A FLOATING ICE COVER,
Washington Univ., Seattle. Div. of Marine Resources.
J. F. Nye.
AIDJEX Bulletin No 21, University of Washington, Division of Marine Resources, p 1-8, July 1973. 4 ref.

Descriptors: *Sea ice, *Deformation, *Rheology, Stress, Strain, Stress analysis.

A conceptual difficulty is presented by two-dimensional models of sea-ice cover. The real ice cover is three-dimensional. How to relate the two-dimensional stresses in the models to the real three-dimensional stresses needs to be resolved before the physical plausibility of any proposed two-dimensional rheology can be determined. If a three-dimensional incompressible viscous continuum floating on water were looked at as a two-dimensional continuum, the two-dimensional medium would appear to have a bulk viscosity equal to three times its shear viscosity; the two-dimensional stresses would have to be related to the three-dimensional stresses by a function of thicknesses; and the momentum equations would not be valid since they omit the derivatives of potential energy. (Knapp-USGS)
W73-14399

THE MEANING OF TWO-DIMENSIONAL STRAIN-RATE IN A FLOATING ICE COVER,
Washington Univ., Seattle. Div. of Marine Resources.
J. F. Nye.
AIDJEX Bulletin No 21, Washington University Division of Marine Resources, p 9-17, July 1973. 3 fig, 2 ref.

Descriptors: *Sea ice, *Rheology, *Strain measurement, *Deformation, *Instrumentation, Variability, Strain gages, Measurement, Strain.

The AIDJEX main experiment includes the measurement of strain in the icepack on certain scales, and it is proposed to model the ice as a two-dimensional continuum. The strains are to be measured by observing the change in position of points fixed in the ice, or by measuring the change in separation of such points. The existence of leads, pressure ridges, and other features shows that the deformation of the icepack is inhomogeneous or discontinuous on the scale of these features; so the result of a measurement may depend somewhat on the precise relation between a measurement point and some local feature. Velocity variations exist on virtually all scales; it is necessary to instrument on a scale appropriate to the scale of the deformation to be measured. (Knapp-USGS)
W73-14400

IS THERE ANY PHYSICAL BASIS FOR ASSUMING LINEAR VISCOUS BEHAVIOR FOR SEA ICE,
Washington Univ., Seattle. Div. of Marine Resources.
J. F. Nye.
AIDJEX Bulletin No 21, Washington University Division of Marine Resources, p 18-19, July 1973.

Descriptors: *Sea ice, *Rheology, *Strain measurement, *Deformation, *Instrumentation, Variability, Strain gages, Measurement, Strain.

A number of models for the large-scale behavior of the arctic sea ice use a linear viscous law for the interaction of the ice with itself. There is no sound evidence, either from the degree of success of these models or from independent sources, that the ice behaves in a viscous manner. Ice probably exhibits brittle behavior under tension, combined with strain-hardening behavior under compression. Strain-hardening under compression, by the successive crunching of thicker ice, would be consistent with the Parmerter-Coon ridging model. Although the ice, modeled as a continuum, is brittle or plastic on time scales of days or weeks, it may nevertheless appear to be viscous on longer time scales. Large random stresses from storms fracture the ice, and the small, long-term steady stress can take advantage of the favorable opportunities so presented. Nothing more happens until the next storm, when the process is repeated. The 'viscosity' would be inversely related to the frequency and intensity of the storms, rather than being any intrinsic property of the ice. (Knapp-USGS)

AN APPROACH TO COUPLING THE DYNAMICS AND THERMODYNAMICS OF ARCTIC SEA ICE,
Washington Univ., Seattle. Dept. of Atmospheric Sciences.
G. A. Maykut.
AIDJEX Bulletin No 21, Washington University Division of Marine Resources, p 23-29, July 1973. 3 fig. ONR Contract N00014-67-A-0103-0007 NSF Grant GV-28807.

Descriptors: *Sea ice, *Thermodynamics, *Rheology, *Water balance, Deformation, Melting, Freezing, Ablation.
Identifiers: *Sea ice dynamics.

Thermodynamics influences the dynamic behavior of sea ice primarily through the formation of new ice on areas of open water, and through ablation and accretion on the horizontal boundaries of existing ice. These mass changes are used in the momentum balance equations and affect the material properties of the icepack. To satisfy the needs of proposed dynamic models, it is necessary to describe changes in the total mass, the area of open water, and the area of thin ice within specified regions. Thermodynamic models can predict growth rates as a function of ice thickness and season; however, the needs of advanced dynamic models cannot be met without some knowledge of the distribution of ice thickness. The continuous range of ice thicknesses is calculated as a number of discrete categories. Equations are then developed to describe how the area covered by each category changes as a result of ice growth, advection, and divergence. The method is independent of any particular dynamic model since the only dynamic input required is the velocity field of the ice. (Knapp-USGS)
W73-14402

ON THE THICKNESS DISTRIBUTION OF SEA ICE,
Washington Univ., Seattle. Dept. of Atmospheric Sciences.
A. S. Thorndike, and G. A. Maykut.

AIDJEX Bulletin No 21, Washington University Division of Marine Resources, p 31-47, July 1973. 11 fig, 3 ref. ONR Contract N00014-67-A-0103-0007 NSF Grant GV-28807.

Descriptors: *Sea ice, *Thermodynamics, *Rheology, *Water balance, Deformation, Melting, Freezing, Ablation.
Identifiers: *Sea ice dynamics.

A region on the surface of the Arctic Ocean may contain ice of many different thicknesses, the relative proportions of which are described by an ice thickness distribution function. The ice thickness distribution regulates the heat exchange between the atmosphere and the ocean, it determines the navigability of ice-covered waters, and it determines the rheological properties of the icepack. The change in area of a region of sea ice results in a redistribution of ice within the region. In divergence, the ice breaks apart; rather than stretching and becoming thinner, it fails, creating open water. In convergence, the thinnest ice is crushed first and piled in some arbitrary way to create thicker, ridged ice. (Knapp-USGS)
W73-14403

THE STEADY DRIFT OF A INCOMPRESSIBLE ARCTIC ICE COVER,
Washington Univ., Seattle. Dept. of Atmospheric Sciences.
D. A. Rothrock.
AIDJEX Bulletin No 21, Washington University Division of Marine Resources, p 49-77, July 1973. 11 fig, 1 tab, 29 ref. ONR N00014-67-A-0103-0007 NSF Grant GV-28807.

Descriptors: *Sea ice, *Stress, *Strain, *Ocean currents, *Ocean circulation, Rheology, Deformation, Arctic Ocean.
Identifiers: *Sea ice drift.

The steady drift of sea ice in an idealized Arctic Basin was calculated assuming that the ice is incompressible and inviscid. The momentum and continuity equations for the ice were solved for the velocity and the ice pressure. The boundary conditions require that no ice flow across coastal boundaries, but that ice flow out of the basin into the Greenland Sea and into the basin from the Kara Sea. The patterns of calculated velocities and vorticities are realistic, but their magnitudes are too high. When the wind stress is reduced to one-third the strength first assumed, realistic speeds and vorticities are obtained. The maximum calculated ice pressure is marginally able to ridge thick ice, according to the ridging model of Parmerter and Coon. These maximum values occur near Greenland where intense ridging is reported. (Knapp-USGS)
W73-14404

DIFFERENTIAL SEA ICE DRIFT I: SPATIAL AND TEMPORAL VARIATIONS IN MESOSCALE STRAIN IN SEA ICE,
Cold Regions Research and Engineering Lab., Hanover, N.H.
W. D. Hibler, W. F. Weeks, A. Kovacs, and S. F. Ackley.
AIDJEX Bulletin No 21, Washington University Division of Marine Resources, p 79-113, July 1973. 15 fig, 4 tab, 14 ref. NSF Grant AG-344.

Descriptors: *Sea ice, *Stress, *Strain, *Ocean currents, *Ocean circulation, Rheology, Deformation, Arctic Ocean.
Identifiers: *Sea ice drift.

Measurements of mesoscale strain in sea ice were carried out over a 5-week period in spring 1972 at the main AIDJEX camp in the Beaufort Sea. They were analyzed to determine inhomogeneities in the strain. A least squares strain tensor time series was also calculated. The least squares divergence between day 83 and 112 exhibited five significant strain events consisting of dilatation followed by convergence. Net areal changes were as large as 3%. Divergence rates were up to 0.12% per hour and shear rates were as large as 0.10% per hour. In the principal axis coordinate system, the events typically exhibited a much larger compression (or extension) along one axis than along the other. The average strain rate tensor could be calculated with rate magnitudes larger than the inhomogeneity variation. The inhomogeneity variation had a scale inversely with the square root of the average length of the strain lines and was only slightly dependent on frequency for frequencies above one cycle per day. Sampling intervals of up to 10 hours are generally adequate for resolving low-frequency strain rates. Low-frequency events show significantly greater spatial correlation than do higher-frequency events. (See also W73-14406) (Knapp-USGS)
W73-14405

DIFFERENTIAL SEA ICE DRIFT II: COMPARISON OF MESOSCALE STRAIN MEASUREMENTS WITH LINEAR DRIFT THEORY PREDICTIONS,
Cold Regions Research and Engineering Lab., Hanover, N.H.
W. D. Hibler, III.
AIDJEX Bulletin No 21, Washington University Division of Marine Resources, p 115-137, July 1973. 5 fig, 2 tab, 18 ref. NSF Grant AG-344.

Descriptors: *Sea ice, *Stress, *Strain, *Ocean currents, *Ocean circulation, Rheology, Deformation, Arctic Ocean.
Identifiers: *Sea ice drift.

The divergence rate and vorticity of sea ice drift follow the local pressure and wind divergence: for low atmospheric pressures and converging winds, the divergence rate is negative and the vorticity counterclockwise; for high pressures and diverging winds, the divergence rate is positive and the vorticity clockwise. This behavior agrees with predictions based upon the infinite boundary solution of linearized drift theory in the absence of gradient current effects and using the constitutive law proposed by Glen for pack ice. The infinite boundary solution of the linear drift equation indicates that in a low-pressure region the ice converges for high compactness (winter) and diverges for low compactness (summer). Calculations were also carried out using a more general linear constitutive law which allows the viscosities to vary with temporal frequency and which includes as special cases a generalized Hookes law as well as the Glen law. A best fit of this more general calculation with strain measurements agrees better with viscous behavior than with elastic behavior, with the frequency dependence of the estimated viscosities approximating closely the Glen law behavior. (See also W73-14405) (Knapp-USGS)
W73-14406

SONAR MAPPING OF THE UNDERSIDE OF PACK ICE,
Wisconsin Univ., Middleton. Geophysical and Polar Research Center.
T. K. Kan, C. S. Clay, and J. M. Berkson.
AIDJEX Bulletin No 21, Washington University Division of Marine Resources, p 155-169, July 1973. 9 fig, 10 ref. ONR Contract N00014-67-A-0128-0019.

Descriptors: *Sea ice, *Surveys, *Sonar, Topography, Deformation, Instrumentation.
Identifiers: *Sea ice ridges.

An under-ice survey was carried out in a pack icefield near Fletchers Ice Island (T-3) by means of a 48 kHz Kelvin Hughes transit sonar lowered through a hole. Five sets of data were collected and transformed into polar coordinate mosaics. The echo length, the shadow zone, the arrival time of echoes, and the sounding depth provide the basic information for interpretation. A complete under-ice map was constructed to show the distribution of the under-ice features. The keel depths of the ridges have been estimated; the average ratio of the peak top elevation to the keel depths is 1.76 (Knapp-USGS)

ARCTIC SEA ICE RIDGE FREQUENCY DISTRIBUTIONS DERIVED FROM LASER PROFILES,
Naval Oceanographic Office, Washington, D.C. Polar Oceanography Div.
W. B. Tucker, III, and V. H. Westhall
AIDJEX Bulletin No 21, Washington University Division of Marine Resources, p 171-180, July 1973. 5 fig, 2 tab, 5 ref

Descriptors: *Sea ice, *Surveys, *Topography, Deformation, Instrumentation, Profiles.
Identifiers: Lasers.

Roughness characteristics of the sea-ice surface were obtained by using basic statistical techniques applied to laser profile data. Ice ridge frequency distributions were calculated for 3600 km of polar ice. Of the sections containing fewer than 0.5 ridges per kilometer, 90% were located off the Alaskan coast below 77 deg north latitude. Of the sections with more than 5.0 ridges per km, 82% were in the nearshore areas extending from northeastern Greenland through the Lincoln Sea and along the Canadian Archipelago to Banks Island. (Knapp-USGS)

Descriptors: *Glaciology, *Glaciers, Mountains, Ice, Snowpacks, International Geophysical Year, Investigations.
Identifiers: USSR, *Siberia, *Soviet Far East.

Mountain-glacier investigations in Siberia and Soviet Far East are divided into 5 periods of glacier study: (1) the prerevolutionary period; (2) the period from the revolution to the International Polar Year (1932-33); (3) the period from the International Polar Year to the start of the International Geophysical Year; (4) the period of the International Geophysical Year (1957-59); and (5) the period following the International Geophysical Year. Excluding the Arctic, the territory is classified into 5 glaciological regions with a total of 2,772 glaciers covering 2,385.9 sq km. Siberian glaciers comprise 34% of all glaciers in the USSR but occupy only about 3% of the country's total glacier area. Problems arising from a study of the territory are discussed. (Josefson-USGS)

IATHEMATICAL ANALYSIS OF A HEAT XCHANGE THAT CAN BE CONTROLLED BY OMPUTER (ANALYSE MATHEMATIQUE 'UN ECHANGEUR DE CHALEUR QUI CONIENT AU CONTROLE PAR ORDINATEUR),
lational Inst. of Scientific Research, Quebec.
. J. Langham.
NRS-Eau, Technical Report No 16, 1973, 40 p, 9 ab.

Descriptors: *Heat exchangers, *Temperature ontrol, *Temperature, *Control, *Snowmelt, Refrigeration, *Numerical analysis, Heat ransfer, Systems analysis, Conductivity, Atenuation, Thermal conductivity.

Laboratory experiments on melting snow require hat the temperature be maintained very accurately at 0C. A device is proposed that adjusts the temerature of the refrigerant by periodic switching of heater. Because of the cylindrical symmetry, the eriodic component in the heat transferred may be nade as small as required, while the mean rate of eating, and thus the final temperature may be ontrolled by time division. Descriptors: *Glaciers, Movement, *Forecasting, Ice, *Glacial drift, Mountains, Profiles, Surveys.
Identifiers: USSR, *Medvezhiy Glacier, *Glacier surges.

Investigations were carried out on the Medvezhiy Glacier (Bear Glacier) in the Western Pamirs to study the mechanism of glacier pulsations and the possibility of predicting them. The glacier area is about 25 sq km, and the glacier tongue ranges in size from 4.8 sq km after recession to 6.2 sq km during the period of maximum expansion. Based on systematic observations of the glacier after the 1963 surge, the glacier is expected to advance again in 1974-75. (Josefson-USGS)

EFFICIENCY OF WATER USE AS INFLUENCED BY MICROMETEOROLOGICAL AND PHYSIOLOGICAL PROCESSES,
Kansas Water Resources Research Inst., Manhattan.
E. T. Kanemasu, I. D. Teare, W. L. Powers, J. W. Sij, and L. J. Brun.
Available from the National Technical Information Service as PB-223 371, $3.50 in paper copy, $1.45 in microfiche. Project Completion Report, Contribution No. 119. July 1973. 68 p, 12 fig, 6 tab, 96 ref. OWRR A-044-KAN (2).

Descriptors: *Evapotranspiration, *Photosynthesis, *Water utilization, *Sorghum, *Antitranspirants, Wheat, Stomata.
Identifiers: Net photosynthesis, Leaf water potential, *Stomatal resistance, Open chamber system.

Water-use efficiency (net photosythesis/evapotranspiration) was studied on sorghum treated with an antitranspirant, pheylmercuric acetate. Short-term studies of 3 to 4 days post-treatment showed that water use efficiency was reduced. Results show that diffusion porometry and field chambers can be used to test other antitranspiratns applied to field-grown crops. Net photosynthesis and water use efficiency of sorghum was not significantly affected during a period of water stress. Stomatal resistance, as measured with the diffusion porometer, increased rapidly at a critical soil moisture and was concurrent with a decline in net photosynthesis. Stomatal resistance may be an indicator for irrigation scheduling. Water use efficiency was studied in awned and awnless isogenic lines of wheat. The laboratory study showed that the awnless isogenic head has a 20% greater water use efficiency than the awned.

PREDICTION OF EVAPORATION FROM HOMOGENEOUS SOIL BASED ON THE FLOW EQUATION,
Agricultural Research Service, Fort Collins, Colo.
H. R. Gardner.
Soil Science Society of America Proceedings, Vol 37, No 4, p 513-516, July-August 1973. 3 fig, 3 tab, 3 ref.

Descriptors: *Evaporation, *Soil water movement, *Water loss, Diffusivity, Earth-air interfaces, Equations, Soil moisture, Soil water.
Identifiers: Soil water evaporation.

Evaporation of water from columns packed with McGrew loamy sand was measured for three different sequences of six water additions and evaporation times totaling 60 days. These treatments were: (1) equal amounts of water added and equal times evaporated, (2) equal amounts applied and varied evaporation times, and (3) various amounts applied and equal evaporation times. The average times and amounts were the same in all treatments, and the total losses were approximately the same. A solution for the diffusivity equation for soils of finite depth was used to predict the cumulative water loss for all the treatments event by event and by an averaging technique. The predicted amounts were all within 6.5% of the total cumulative evaporation. (Knapp-USGS)

DIERNAL SOIL-WATER EVAPORATION: CHLORIDE MOVEMENT AND ACCUMULATION NEAR THE SOIL SURFACE,
Agricultural Research Service, Phoenix, Ariz. Water Conservation Lab.
F. S. Nakayama, R. D. Jackson, B. A. Kimball, and R. J. Reginato.
Soil Science Society of America Proceedings, Vol 37, No 4, p 509-513, July-August 1973. 9 fig, 10 ref.

Descriptors: *Evaporation, *Chemical precipitation, *Soil water, Soil water movement, Water chemistry, Diurnal, Chlorides, Soil chemistry, Leaching, Mass transfer, Ion transport.

Movement and accumulation of chloride at shallow depths (0 to 9 cm) were studied in a bare soil following an irrigation. Chloride accumulation in the 0- to 0.5- and 0- to 1-cm depth increments followed a diurnal pattern but out-of-phase from the soil water content during the first few days after irrigation. The diurnal amplitude of chloride decreased with time as the soil progressively dried. At 1- to 2-cm and deeper depths, diurnal cycling of the chloride content was not measurable, whereas cycling in the water content was evident. Most of the total chloride accumulation at the shallowest depth occurred in the early stages of drying. However, chloride movement was detected as low as 4% volumetric water content or approximately -1,000 bars soil water potential. (Knapp-USGS)

DIURNAL SOIL-WATER EVAPORATION: TIME-DEPTH-FLUX PATTERNS,
Agricultural Research Service, Phoenix, Ariz. Water Conservation Lab.
R. D. Jackson, B. A. Kimball, R. J. Reginato, and F. S. Nakayama.
Soil Science Society of America Proceedings, Vol 37, No 4, p 505-509, July-August 1973. 8 fig, 6 ref.

Descriptors: *Evaporation, *Soil water movement, Drying, Air-earth interfaces, Lysimeters, Evaporimeters.

Time-depth patterns of soil water flux in the 0- to 9-cm zone of a bare field soil are described for four 24-hour periods at 3, 7, 16, and 37 days after irrigation. On day 3, the flux at 0 cm (Evaporation) dominated the flux patterns for all depths. As the soil dried, this flux decreased and those at the greater depths gradually became dominant. On all 16 days of measurement, downward flux was observed below 1 to 3 cm during several hours between sunrise and early afternoon. Only one period of downward flux was observed for day 3, but 2 to 4 periods were noted for subsequent days. These patterns demonstrate the dynamic nature of soil water flux in the surface zone of a field soil subjected to diurnally varying environmental conditions. (Knapp-USGS)

EFFECT OF CLEARCUTTING A BLACK SPRUCE BOG ON NET RADIATION,
Forest Service (USDA), Grand Rapids, Minn. Northern Conifers Lab.
J. M. Brown.
For Sci. Vol 18 No 4, p 273-277. 1972.
Identifiers: Albedo, Black spruce, *Bogs, Cutting, Energy balance, Evapo transpiration, Picea-Mariana, Radiation, *Spruce, Transpiration, *Clearcutting, *Minnesota.

Net radiation measured over a black spruce (Picea mariana) stand and a clearcut strip in a northern Minnesota bog showed little difference in daytime values the first summer after logging. The second summer after logging net radiation was lower in the clearcut strip than over the black spruce stand by 14% in June and 20% in Sept. This difference was due to different surface albedos. Although more energy was potentially available for evapotranspiration in the black spruce stand, more energy was converted into sensible heat than in the clearcut strip.--Copyright 1973, Biological Abstracts, Inc.

Descriptors: *Runoff, *Runoff coefficient, *Annual, *Variability, Correlation analysis, Regression analysis, Evaporation, Moisture, Moisture deficit, Maps, Equations.
Identifiers: USSR, *West Siberia.

Annual runoff coefficients vary widely in years with low and high runoff. Variation coefficients of annual runoff coefficients were calculated for West Siberia for 1936-60 and a map shows the gradual increase in variation coefficients towards the south (from 0.20 to 0.60). The correlation coefficient of the relation of annual runoff coefficients to total evaporation deficit is 0.86 and correlation coefficients of the relation of annual runoff coefficients to total moisture deficit decrease from 0.98 in the north to 0.72 in the south. A gradual decrease in closeness of the relation of runoff coefficients to total moisture deficit and total moisture is observed from north to south. The regression equations obtained can be used for estimations of runoff coefficients in ungaged regions and, in some cases, for forecast purposes. (Josefson-USGS)

AIRY WAVE THEORY AND BREAKER HEIGHT PREDICTION,
Oregon State Univ., Corvallis. School of Oceanography.
P. D. Komar, and M. K. Gaughan.
In: Proceedings of the 13th Coastal Engineering Conference ASCE, July 10-14, 1972 Vancouver, B.C., Canada, p 405-418, 1972. 6 fig, 17 ref. NOAA SG 2-35187.

Descriptors: *Waves (Water), *Ocean waves, Lake shores, Beaches, *Coasts.
Identifiers: *Breaker height prediction, Airy wave theory, Solitary waves, *Near shore processes, *Wave forecasting.

The applicability is examined of linear Airy wave theory to evaluate wave breaker heights. A new relationship is deduced from which the breaker height can be predicted from the deep water wave parameters (wave height and wave period). The theoretical development is set forth and comparison is made with solitary wave theory. The relationship established here is successful over the entire practical range of wave steepness values. It can also replace the empirical curve given by Munk for the intermediate range of wave slope values. (Sinha-OEIS)

IP CURRENTS. 2. LABORATORY AND FIELD)BSERVATIONS,
iverpool Univ. (England). Tidal Inst.
). L. Inman.
ournal of Geophysical Research Vol 74, No 23, p 479-5490, October 20, 1969. 9 fig, 4 tab, 11 ref.

Descriptors: *Rip currents, *Shallow water, Waves (Water), Coasts.
dentifiers: *Near shore processes, Incident vaves, Standing edge waves, *Circulation cells, Longshore currents, *Surf zone, Cusp formation.

The nearshore circulation of water on a plane each exposed to a uniform wave train, normally ncident on the beach, was investigated experimentally in the laboratory. The incident waves generated standing edge waves on the beach of the ame frequency as the incoming waves. The interaction between these edge waves and the incident waves gave rise to steady flow patterns nearshore circulation cells) consisting of an onshore flow toward the breakers, a longshore current in the surf zone, and an offshore flow in relatively strong, narrow rip currents. The rip currents were found to occur at alternate antinodes of he edge waves, and the spacing of the rip current was therefore equal to the longshore wavelength of the edge waves. Field observations made in the Gulf of California strongly suggest that this nechanism is important on real beaches. (See also W70-01431) (Sinha-OEIS)

PERIODIC MOTIONS OF THE SEASONAL THERMOCLINE ALONG THE SOUTHERN CALIFORNIA COAST,
Naval Electronics Lab. Center, San Diego, Calif.
J. L. Cairns, and E. C. LaFond.
Journal of Geophysical Research Vol 71, No 16, p 3903-3915, August 15, 1966. 12 fig, 11 ref.

Descriptors: *Thermocline, *Tides, *Forecasting, *California, *Coasts, Seasonal, *Winds.
Identifiers: Diurnal oscillation, Bathythermographic data, Periodic motions.

An investigation off the southern California coast has shown that a significant part of seasonal thermocline motion is caused by wind transport. A linear relationship for this motion, which takes into account the 14- to 16-hour response time occurring between wind and depth changes, has been established. Through this relationship it is possible to compute and predict movements of the thermocline caused by the wind. Those found to occur regularly include a diurnal oscillation, an oscillation of 4 1/2-day period, and an over-all upward trend throughout the summer. Tidal thermocline oscillations were studied with the wind effects removed. It was found that during the 4 months of nearly continuous thermocline depth data the internal tide lagged the surface tide by 3 to 5 hours and averaged 4 or 5 times as great in amplitude. TSUNAMIS AS GEOLOGICAL AGENTS,
Western Australia Univ., Nedlands. Dept. of Geology.
P. J. Coleman.
Journal of the Geological Society of Australia, Vol 15, Part 2, p 267-273, 1968. 32 ref.

Descriptors: *Coasts, *Sediment transport, *Tsunamis, *Shallow water, Turbidity currents, Estuaries, Bays, Bathymetry.
Identifiers: Near shore processes.

When a tsunami wave series approaches and interacts with a coast, the consequent passage shorewards of great volumes of water and their invasion of the land, especially within bays and up river valleys, results in the disturbance of existing sediment and the removal seawards of land debris and coastal and shallow-water marine sediments. Tsunami action builds up sequences of peculiar sediments in shallow water; it at least assists in the formation and maintenance of submarine canyons and, through them, produces turbidity currents of a particularly powerful kind. Tsunami action may explain many puzzling sedimentary phenomena, for example, sudden and drastic changes in nearshore bathymetry; the formation of chaotic sediments such as some paraconglomerates and edgewise conglomerates. It offers solutions to problems arising from the study of turbiditic sequences, both modern and ancient. (Sinha - OEIS)

NOTE ON SOME REYNOLDS STRESS EFFECTS OF INTERNAL WAVES ON SLOPES,
Massachusetts Inst. of Tech., Cambridge. Dept. of Earth and Planetary Sciences.
C. Wunsch.
Deep-Sea Research Vol 18, p 583-591, 1971. 2 fig, 11 ref. Nonr-1841 (74), Nonr-3963 (31).

Descriptors: *Coasts, Beaches, *Mixing, Mathematical models, *Interal waves, *Waves (Water).
Identifiers: *Reynolds stress effects, Shoaling beaches, Longshore geostrophic flow, Bermuda, Isopycnals, *Beach slope, Momentum flux, Eulerian flow.

When two-dimensional internal waves encounter a shoaling region, the second order mass and momentum flux carried by the waves must be re-adjusted if no mixing occurs. The re-adjustment occurs by a 'set-up' and 'set-down' of the mean isopycnals generating a second order mean Eulerian flow to cancel the Stokes drift velocity. Since the effects of Coriolis forces in an infinite flat bottomed channel are analogous to buoyance forces on a sloping bottom, rotation is easily taken into account, however the problem is degenerate to an arbitrary long-shore geostrophic flow. (Sinha - OEIS)

EXPERIMENTAL STUDY OF WATERFLOOD TRACERS,
Jersey Production Research Co., Tulsa, Okla.
R. A. Greenkorn.
Journal of Petroleum Technology, Vol 14, No 1, p 87-92, January, 1962. 4 fig, 4 tab, 28 ref.

Descriptors: *Flooding, *Injection, *Tracers, Analytical techniques, Chemical analysis, Laboratory tests, Electrolytes, Fluorescence, Radioactivity techniques, Tritium, Sands, Adsorption, Chlorides, Iodides, Nitrates, Bromides, Boron.
Identifiers: Dichromate, Thiocyanate, Breakthrough, *Elution curves.

To locate flow paths in a pilot flood, five tracers were needed that could be used together. Thirteen tracers were selected to be tested for grass adsorption on sand and ease and reliability of analysis. Flow tests of brine containing the tracers were made in a sand column containing untreated brine. Breakthrough-elution curves showed that tritiated water, and bromide, chloride, iodide, nitrate and thiocyanate ions met the requirements for ease of analysis and calculation of injected pore volume. Analytical procedures for each of the thirteen substances examined are given in an appendix. A control chart for duplicate analysis, flow test equipment and procedure and tracer theory are also discussed briefly in appendices. Any contemplated field tracer study should be preceded by laboratory tests at the anticipated flow rates, using the tracers and the porous media to be found in practice. The interpretation of tracer data from resident times of years is doubtful. (Gray-NWWA)

OPTIMAL IDENTIFICATION OF AQUIFER PARAMETERS IN A DISTRIBUTE SYSTEM,
California Univ., Los Angeles. Dept. of Engineering.
A. C. Lin.
Ph.D. Dessertation, 1973. 88 p, 9 fig, 10 tab, 78 ref. UCAL-WRC-W-290.

Descriptors: Aquifers, *Groundwater, *Optimization, *Base flow, *Aquifer characteristics, *Distribution systems.
Identifiers: *Quasilinearization.

The identification of parameters in an unconfined aquifer and stream interaction system is formulated in terms of an optimal control problem. The dynamics of the aquifer head, in general, is governed by a nonlinear partial differential equation of second order. Applying the maximum principle, as well as least-squares optimization, in conjunction with the technique of quasilinearization, aquifer parameters are directly identified based upon observational data at observation stations. The problem of identifying aquifer parameters being considered not only concerns the constant case, but also deals with more complex cases in which the parameters vary with space and/or time. IDENTIFICATION OF PARAMETERS IN FINITE LEAKY AQUIFER SYSTEM,
California Univ., Los Angeles. Dept. of Engineering Systems.
M. A. Marino, and W. W-G. Yeh.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol. 99, No. HY2, p 319-336, 5 fig, 5 tab, 15 ref. UCAL-WRC-W-290.

Descriptors: *Aquifer characteristics, Aquifers, *Groundwater, *Leakage, *Artesian aquifers, Optimization, *Algorithms, Graphical methods, Base flow.
Identifiers: Quasilinearization.

Existing methods for analyzing leaky artesian systems are graphical procedures which involve inflection-point estimation and extrapolation of field data, or superposition and matching, or both, of field data to a family of theoretical curves provided that analytical solutions are attainable. At present, there is no analytical method that treats a leaky artesian system of finite configuration. A systematic procedure for the identification of aquifer parameters in a finite leaky artesian system is developed that converts field observations directly to system parameters. The parameters to be identified are the transmissivity and storativity of the main aquifer and the leakage factor of the system. The algorithm involves finite difference approximation and quasilinearization in conjunction with least-squares optimization. Examples that demonstrate the applicability of the algorithm are presented. (See W73-14375) (Snyder-California)

MINERAL AND THERMAL WATERS OF CANADA,
Geological Survey of Canada, Ottawa (Ontario).
J. G. Souther, and E. C. Halstead.
Canada Geological Survey Paper 73-18, 1973. 32 p, 7 fig, 2 tab, 25 ref, $1.00. (Reprinted from Proc of 23rd International Geological Congress, Vol 19, p 225-256, Prague, 1969.)

Descriptors: *Springs, *Mineral water, *Thermal springs, *Canada, Water utilization, Economics, Recreation, Groundwater movement, Geology, Topography, Water yield, Water quality, Groundwater recharge, Water temperature, Chemical analysis, Water analysis.
Identifiers: Hot springs resorts, Health resorts, Therapeutic water.

The distribution and character of mineral and thermal waters in Canada are closely related to regional topographic and geologic features. Each of the six main physiographic regions is underlain by distinctive rock types and structures that control the circulation of groundwater and hence influence the temperature and quality of water issuing from springs and flowing wells. Most springs including all known thermal springs in Canada occur in the Cordilleran Region where high topographic relief permits deep circulation of meteoric water through local and regional flow systems and where relatively high precipitation provides an ample supply of recharge water. Nonthermal springs in other regions of Canada are mainly brine springs. They are commonly associated with Paleozoic marine sedimentary rocks, chiefly limestone, dolomite and shale interbedded with rock salt, gypsum and anhydrite, that overlap the Canadian Shield on the eastern edge of the Interior Plains and occupy sedimentary basins in the Saint Lawrence Lowland and Appalachian regions. A number of thermal springs in western Canada have been developed as recreational and health resorts and water from several nonthermal springs in Quebec is bottled and sold for therapeutic use. NEW APPROACHES TO WATER-RESOURCES INVESTIGATIONS IN UPSTATE NEW YORK,
Geological Survey, Albany, N.Y.
A. M. La Sala.
Ground Water, Vol 5, No 4, p 6-11, October, 1967. 9 fig, 3 tab, 3 ref.

Descriptors: Water sources, Water resources, Water analysis, Water quality, Chemical analysis, Streamflow, Runoff, Bank storage, Base flow, Low flow, Gaging stations, Measurement, *Groundwater recharge, Aquifer characteristics, *New York, *Surface-groundwater relationships
Identifiers: *Dissolved solids content, Lake Erie-Niagara basin, *Groundwater rating curve method.

Groundwater in New York State has been intensively studied in large basin investigations, both because of its large potential for future development and because of its interrelation with surface water resources. The latter reason is particularly important because the principal aquifers are numerous unconnected glacial sand and gravel deposits that are crossed by streams. This ground water regimen to a large degree determines the flow characteristics and water quality of streams. Conversely, streamflow data provide a convenient means of assessing ground water availability. The comprehesive program presented here has tried to use surface water data to investigate ground water systems. In this attempt to approach a study of ground water availability and quality by use of stream flow data, the relationship between stream flow quality and ground water discharge is demonstrated. A formula was developed to estimate stream flow quality in relation to quality and quantity of ground water discharge. In large-scale and comprehensive basin investigations such stream studies have also provided a practical means of estimating ground water recharge. (Hunt-NWWA)

SELECTED BIBLIOGRAPHY ON LABORATORY AND FIELD METHODS IN GROUND WATER HYDROLOGY,
Geological Survey, Washington, D.C.
A. I. Johnson.
Geological Survey Water-Supply Paper 1779-Z, 1964. 20 p.

Descriptors: *Groundwater, Water quality, Mathematics, Physics, Soil mechanics, Soil physics, Geology, Hydraulics, Measurement, *Bibliographies, *Reviews, *Methodology.
Identifiers: *Well construction, Soil moisture equipment.

Presented is a selected bibliography on laboratory and field methods in ground water hydrology and selected areas: mathematics, physics, soil mechanics, soil physics, geology and hydraulics. The selected topics are designed to benefit the young American or foreign national hydrologist by presenting some basic and some advanced reports on methodology, and while not designed to be all-inclusive will provide a ready guide to useful source materials. 2G. Water in Soils

SYSTEMATIC TREATMENT OF INFILTRATION WITH APPLICATION,
Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
H. J. Morel-Seytoux.
Available from the National Technical Information Service as PB-223 347, $3.75 in paper copy, $1.45 in microfiche. Completion Report Series No. 50, Colorado Environmental Resources Center, Fort Collins, June 1973. 64 p, 18 fig, 1 tab, 45 ref. OWRR B-070-COLO (1). 14-31-0001-3566.

Descriptors: *Infiltration rates, Flow, Compressibility, Numerical methods, Experimental results, *Soil moisture, Porous media, *Unsaturated flow, Infiltration, *Air water interfaces
Identifiers: *Two-phase flow, Air viscous effect

Research has shown that the effects of air movement and air compressibility in soil columns are important. For soils underlain by a relatively impervious layer or by a shallow water table methods based on Richards' equation would overpredict infiltration rates by factors of 2,3 or more. Even when air compressibility effects are insignificant as in the case y of an open semi-infinite column air viscous effects are important. The formula of Green and Ampt underestimates the viscous resistance to flow behind the wetting front from 20 to 70 percent depending on soil type. The use of a theory that considers the movement of water and air in the unsaturated zone has the advantage of accountinf for observed experimental results that cannot be modeled by the one-phase flow theory. In addition the mathematical problem is actually simplified, not complicated, by the more complete approach. The fact that the problem of Green and Ampt could be solved simply in a few lines whereas it had eluded solution since 1911 is conclusive evidence. Comparison with experimental results shows that the approximations in the methods of solution yield highly accurate and practical estimates of the infiltration quantities of interest.

WATER FLOW IN SOIL IN PRESENCE OF SOYBEAN ROOT SINKS,
Minnesota Univ., Minneapolis. Dept. of Soil Science.
L. M. Arya.
Available from the National Technical Information Service as PB-223 505, $11.00 in paper copy, $1.45 in microfiche. Minnesota Water Resources Research Center, St. Paul, Bulletin 60, June 1973. 163 p, 62 fig, 8 tab, 106 ref. B-015-MINN (7). 14-01-0001-1916.

Descriptors: *Soil water movement, *Soybeans, *Evapotranspiration, Crop response, Soil profiles, Irrigation, Hydraulic conductivity, Roots.
Identifiers: *Soil water suction, Suction, Soil water depletion, Root sinks.

Water depletion patterns in the 10 to 70-cm soil depth in the root zones of two soybean varieties, 79.648 and Chippewa-64, and in a bare soil were established on Waukegan loam. Soil hydraulic properties of the soil profile, suction-water content and hydraulic conductivity-suction relationships were determined in the laboratory and supported by field measurements. Following irrigation, proportional contribution of various soil layers to the total water loss showed a downward shift with the growth state of soybeans. In general, 10-cm layers in the upper horizons constributed a major portion to the total water losses. The contribution of the 10 to 20-cm layer remained above 20 percent while that of the 50 to 60-cm layer accounted for less than 10 percent of the total water loss from the 10

to 70-cm profile. During the early stages of growth the evapotranspiration rate was 0.64 cm/day which agrees with the pan evaporation rate of 0.66 cm/day. Soil outside the 10 to 70-cm zone contributed about 0.2 cm/day towards evapotranspiration. About 55 percent of the soil volume showed root densitities of 1.0 to 2.0 cm/cm3. Generally, root density tended to be higher near the plant rows and between the 25 and 45-cm depths betlow the surface. (Walton-Minnesota)

WEATHERING OF BIOTITE IN SOILS OF A HUMID TROPICAL CLIMATE,
Ife Univ. (Nigeria). Dept. of Soils.
A. G. Ojanuga.
Soil Science Society of America Proceedings, Vol 37, No 4, p 644-646, July-August 1973. 2 fig, 18 ref.

Descriptors: *Weathering, *Clay minerals, *Soil formation, *Tropical regions, Kaolinite, Iron, Leaching, Clays.

Weathering of biotite was studied in saprolites derived from granite and gneiss. The soils are in the Southwestern Upland of Nigeria, an area characterized by a humid tropical climate. Kaolinite is the dominant product in the well-drained, moderately acidic, tropical soils studied. The formation of kaolinitic pseudomorphs represented a stage in the kaolinization of biotite in the soils. (Knapp-USGS)

RESPONSE OF SALINITY SENSORS TO RAPIDLY CHANGING SALINITY,
Agricultural Research Service, Riverside, Calif. Salinity Lab.
J. Wesseling, and J. D. Oster.
Soil Science Society of America Proceedings, Vol 37, No 4, p 553-557, July-August 1973. 5 fig, 3 tab, 12 ref.

Descriptors: *Salinity, *Electrical conductivity, *Instrumentation, Calibrations, Water chemistry, Diffusion, Diffusivity.
Identifiers: *Soil salinity meters.

A theory developed to describe the response of the sensor to changes in soil salinity is based on the assumption that diffusion of solutes into and out of the sensitive element of a salinity sensor determines its response time. This theory was experimentally verified in solution and in soils. The response of a sensor is adequately described by a single response factor. Proper use of this factor permits the actual electrical conductivity of the soil solution to be inferred from sensor readings where soil salinity changes rapidly. (Knapp-USGS)
W73-14417

A COMPARISON BETWEEN MERCURY INJECTION AND NITROGEN SORPTION AS METHODS OF DETERMINING PORE SIZE DISTRIBUTIONS,
Western Australia Univ., Nedlands. Dept. of Soil Science and Plant Nutrition.
I. D. Sills, L. A. G. Aylmore, and J. P. Quirk.
Soil Science Society of America Proceedings, Vol 37, No 4, p 535-537, July-August 1973. 3 fig, 15 ref.

Descriptors: *Porosity, *Soils, *Soil physical properties, *Pores, Porous media, Infiltration.
Identifiers: Pore geometry, Goethite.

Mercury injection and nitrogen sorption methods of pore size distribution analysis were compared on a sample of goethite using the silt-shaped pore model. Using the commonly accepted contact angle of 140 deg for mercury, the mercury pore-size distribution plot is displaced by approximately 20% in plate separation with respect to the nitrogen plot. The assumption of a contact angle of 153 deg for mercury is required to make the plots coincide. Combination of the two techniques provide a useful method of pore size distribution analysis over a large range of pore sizes. This approach is particularly appropriate to the investigation of the pore structure of soil materials. (Knapp-USGS)
W73-14418

USING INFILTRATIONS OF HEPTANE AND WATER INTO SOIL COLUMNS TO DETERMINE SOIL-WATER CONTACT ANGLES,
Florida Univ., Gainesville. Dept. of Soil Science.
B. Bahrani, R. S. Mansell, and L. C. Hammond.
Soil Science Society of America Proceedings, Vol 37, No 4, p 532-534, July-August 1973. 2 fig, 17 ref.

Descriptors: *Wetting, *Infiltration, *Wettability, *Drying, Infiltrometers, Soil physical properties, Leaching, Surface tension.
Identifiers: *Heptane, *Water-repellent soils.

A horizontal infiltration procedure using two liquids, water, and heptane was used for determining wetting soil-water contact angles in columns of water-repellent soil. The method can be used to measure contact angles less than, equal to, or greater than 90 deg and requires minimal reaction time between water and soil during experimental measurements. This technique was applied to two columns of water-repellent Pomello fine sand for six cycles of wetting, leaching, and drying. Wetting contact angles decreased from 101 deg initially to 91 deg after the six cycles. (Knapp-USGS)

COINCIDENCE AND INTERFERENCE CORRECTIONS FOR DUAL-ENERGY GAMMA RAY MEASUREMENTS OF SOIL DENSITY AND WATER CONTENT,
Florida Univ., Gainesville. Dept. of Soil Science.
R. S. Mansell, L. C. Hammond, and R. M. McCurdy.
Soil Science Society of America Proceedings, Vol 37, No 4, p 500-504, July-August 1973. 3 fig, 2 tab, 11 ref.

Descriptors: *Nuclear moisture meters, *Soil moisture meters, *Gamma rays, Bulk density, Soil water, Calibrations, Instrumentation.
Identifiers: Gamma-ray spectrometers.

Volumetric water content and bulk density changes in a soil column can be simultaneously and rapidly determined from single-detector attenuation measurements of a high intensity, dual-energy beam of gamma photons. Coincidence loss due to interference between the two monoenergetic gamma rays and Compton scattering provides gamma photon intensities which are undesirably interdependent. Correction procedures are given for providing independent determinations of both 60 and 662 keV gamma ray intensities. (Knapp-USGS)
W73-14424

A MATHEMATICAL INVESTIGATION OF STEADY INFILTRATION FROM LINE SOURCES,
Colorado State Univ., Fort Collins. Dept. of Mathematics.
D. W. Zachmann, and A. W. Thomas.
Soil Science Society of America Proceedings, Vol 37, No 4, p 495-500, July-August 1973. 4 fig, 8 ref.

Descriptors: *Infiltration, *Soil water movement, *Subsurface irrigation, Evaporation, Equations, Hydraulic conductivity.

Equations which can be used in the design of subsurface irrigation systems are based on the physics of steady infiltration from a distribution of line sources which lie in a horizontal plane and are parallel and equally spaced. The analytical solution describes the flow from the line sources in the presence of uniform infiltration or evaporation at the soil surface. To increase the utility of the solution, the equations for matric flux potential and stream function are written in dimensionless form. (Knapp-USGS)
W73-14425

UNSTEADY TWO-DIMENSIONAL FLOW OF WATER IN UNSATURATED SOILS ABOVE AN IMPERVIOUS BARRIER,
Iowa State Univ., Ames. Dept. of Agronomy.
H. M. Selim, and D. Kirkham.
Soil Science Society of America Proceedings, Vol 37, No 4, p 489-495, July-August 1973. 6 fig, 20 ref.

Descriptors: *Soil water movement, *Wetting, *Unsaturated flow, *Aquicludes, Unsteady flow, Ditches, Numerical analysis, Drainage systems.

The equation describing unsteady two-dimensional water flow in unsaturated soils may be solved by use of a finite difference approximation and an alternating-direction implicity method. The two-dimensional medium is a homogeneous soil with an impervious barrier at some depth from the soil surface and having equally spaced trenches. The bottoms of the trenches are wetted at time zero and are kept at a constant 0.50 water content. The initial soil water content is 0.20. Water movement from the walls of the trenches and the soil surface is neglected. The water content at all locations in the flow medium was obtained for an Ida silt loam soil with two geometries. Near trenches with 120-cm spacing, 30-cm deep, and 30-cm wide, the wetting front reaches a depth of 30 cm in 35 min, and reaches the soil surface in 140 min. Near trenches with 60-cm spacing, 15-cm deep, and 15-cm wide, the wetting front reaches a depth of 30 cm in 45 min, and reaches the soil surface in 30 min. (Knapp-USGS)
W73-14426

CHARACTERISTICS OF THE SOIL MATRIX THAT AFFECT WATER STORAGE AND MOVEMENT,
Minnesota Univ., Minneapolis. Dept. of Soil Science.
G. R. Blake.

Available from the National Technical Information Service as PB 223 539, $3.00 in paper copy, $1.45 in microfiche. Minnesota Water Resources Research Center, Minneapolis, Mimeographed Report, August 1973. 34 p, 6 tab, 13 ref. OWRR B-015-MINN (8), 14-01-0001-1916.

Descriptors: *Soil moisture, *Soil aggregates, Crops, Water loss, *Minnesota, Hydraulic conductivity, Cultivation.
Identifiers: *Soil water suction, *Suction-water content, Soil matrix, Soil structure, Thixotropic, Colloidal surface.

Soil that consolidates under influence of water and of machines and animals is usually loosened by tillage. Soil sheared by plows or other tillage implements re-forms with time giving a more water-stable matrix. Soil matric suction increased with time in pulverized, moistened, pressed soil sealed to prevent water loss. Water stability also increased with time for simulated aggregates formed by extrusion under pressure. An interesting field application that increased the soil moisture storage reservoir was established on two sandy soil types where moisture deficiency is the principal yield-limiting factor. Treatment consisted of plowing in a nearly continuous, hot sprayed asphalt barrier 55 cm deep in two replicated experiments. The practical result of this barrier was to increase the plant available water in Zimmerman fine sand from 2.9 cm in the surface 55 cm. In Hubbard loamy coarse sand a sand-gravel layer at 25 to 50 cm itself acted as a barrier to water movement. In the Zimmerman soil it was shown that over a 3-year period supplemental water needed to keep an active growing crop could be reduced by 58% with a barrier. Probable water loss by percolation, on the other hand, would have been less than half as great with a barrier as without. (Walton-Minnesota)

THE RELATIONSHIP BETWEEN SOIL STRUCTURE FACTOR AND BOTH SOLUBLE AND EXCHANGEABLE SODIUM AND CALCIUM IN THE NILE ALLUVIUM OF EGYPT,
Cairo Univ., Giza (Egypt). Dept. of Soils.
A. Fathi, K. E. Khalil, and S. Milad.
United Arab Republic Journal of Soil Science, Vol II, No 2, p 213-232. 1971. 8 fig, 2 tab, 1 map, 7 ref.

Descriptors: *Soil structure, *Weathering, *Cation exchange, *Alluvium, Deposition (Sediments), Annual flood, Sodium, Calcium.
Identifiers: *Nile Valley (UAR).

Weathering factors on the igneous and metamorphic rock of the Ethiopian plateau compose the soils in much of Egypt's arable lands. They are formed through sedimentation of mud carried by annual floods, and are relatively rich in clay which is greatly affected by soluble exhangeable sodium and calcium cations. The increase in the percentages of soluble and exchangeable calcium increases the soil structure factor, while the increase in both soluble and exchangeable percentages of sodium lowers it. This study was conducted on 2 transects: the first crossing the Nile Delta 30 km north of the Barrage, the second crossing the Nile Valley on the western side of the stream, 12 km south of the Barrage to the borders of the Western Desert. (Bahre-Arizona)

M. B. Minkin, A. G. Kalmykov, and N. I. Buravchuk.
Pochvovedeniye, No 10, p 121-125, October 1972. 1 fig, 1 tab, 11 ref.

Descriptors: *Soil physics, *Plasticity, *Plasticity index, *Soil moisture, *Moisture content, Soil properties, Liquid limits, Viscosity, Dispersion, Humus, Sodium, Chernozems, Chestnut soils, Curves.
Identifiers: USSR, *Rostov Oblast, Solonetzes.

Soil plasticity values determined by the cone method of Vasil'yev and the method of Volarovich increase with increasing contents of humus and exchangeable sodium and with increase in degree of disperson. Volarovich's soil plasticity index, which has a strict physical basis, can be used to describe soil physiocomechanical properties over a wide moisture range. Samples of Solonetz, Chestnut, and Chernozem soils from Rostov Oblast were used to show dependence of plasticity on certain soil properties. (Josefson-USGS)

DESCRIPTION OF WATER-SALT RELATIONS OF SOME SOILS IN CENTRAL CISCAUCASIA FROM LYSIMETER EXPERIMENTAL DATA (KHARAKTERISTIKA VODNO-SOLEVOGO REZHIMA NEKOTORYKH POCHV TSENTRAL'NOGO PREDKAVKAZ'YA PO DANNYM LIZIMETRICHESKIKH OPYTOV),
S. P. Sokolovskiy.
Pochvovedeniye, No 10, p 88-98, October 1972. 1 fig, 6 tab, 11 ref.

Descriptors: *Land reclamation, *Soils, *Water balance, *Salt balance, *Lysimeters, Soil water, Soil properties, Saline water, Brackish water, Freshwater, Groundwater, Water table, Crops.
Identifiers: USSR, *Ciscaucasia, Mineralization.

Lysimeter investigations in different regions of large irrigation systems in the Central Ciscaucasus are described. Investigations were conducted on calcareous Chernozems, Solonetzic Chernozems, and on Chestnut, Chernozemic, and Alluvial-Meadow soils. Chestnut and Chernozem loam soils are more rapidly salinized by mineralized groundwater (>11-12 g/liter) than clayey soils (Solonetzic Chernozems). Critical groundwater depth for different soils ranged from 0.5 m to 1.8 m, depending on soil hydrophysical properties, soil water and salt relations, groundwater mineralization, and character of land use. Plant suction increases concentration of soil solutions and accelerates soil salinization by mineralized groundwater. (Josefson-USGS)

J. P. Carmouze.
Cah. ORSTOM Ser. Hydrobiol. Vol 5, No 3/4, p 191-212. Illus. 1971. (English Summary).
Identifiers: *Chad (Lake Chad), Circulation, Lakes, *Sodium.

The Na content of the river waters varies according to the time they spent in the lake. It is possible by this relation to trace the general movements of the lake waters by observation of the distribution in time and space of the Na concentration. The modifications caused by the variations of other saltness factors are considered. The hydrodynamic factors are analyzed in order to explain annual water movements.-- Copyright 1973, Biological Abstracts, Inc.

SOME THREE-DIMENSIONAL EFFECTS IN SURF,
Wisconsin Univ., Madison.
R. E. Meyer, and R. B. Turner.
Journal of Geophysical Research, Vol 72, No 10, p 2513-2518, May 15, 1967. 1 fig, 7 ref, 1 append. Nonr 562 (34), Nonr 1202 (27).

Descriptors: *Surf, *Beaches, *Waves (Water), Shallow water, Hydrodynamics, Coasts, Ocean waves.
Identifiers: *Beach geometry, Swell, Near shore processes.

The asymptotic equations of surf are derived for shallow beaches with a geometry causing longshore variations in the water motion. Such surf is generally governed by three-dimensional nonlinear shallow-water equations. When the seabed profile parallel to shore is of gentler slope than the profile normal to shore, however, the asymptotic equations are shown to differ only in minor respects from those of two-dimensional surf. Such 'weakly three-dimensional' surf can be analyzed directly in terms of the results of the two-dimensional theory, and the run-up bounds of that theory are extended accordingly. (Sinha-OEIS)

PLAN GEOMETRY OF HEADLAND-BAY BEACHES,
Virginia Polytechnic Inst., Blacksburg. Dept. of Geological Science.
W. E. Yasso.
Journal of Geology, Vol 73, No 5, p 702-714, September 1965. 6 fig, 8 ref.

Descriptors: *Beaches, *Sediment transport, Sedimentation, *Waves (Water), Coasts.
Identifiers: *Headland-bay beaches, Near shore processes, Geometry, Wave refraction, Wave train diffraction, *Coastal geomorphology.

A 'headland-bay' beach is defined as a beach lying in the lee of a headland subjected to a predominant direction of wave attack. Such beaches characteristically have a seaward-concave plan shape resulting from erosion caused by refraction, diffraction, and reflection of waves into the shadow zone behind the headland. Tide-induced currents have no direct effect on the plan shape of headland-bay beaches. Increasing radius of plan curvature with distance from the headland suggested testing the logarithmic spiral, r ± e theta cot alpha, as an approximation to the shape of headland-bay beaches. Four natural beaches were selected for testing goodness of fit to the log-spiral approximation: Spiral Beach, Sandy Hook, New Jersey; Halfmoon Bay Beach, California; Drakes Beach and Limantour Spit Beach lying along the Drakes Bay shoreline to the north of San Francisco, California. Published maps were used as a source of data on shoreline shape except for Spiral Beach which was mapped by the writer using engineer's transit in a longitudinal survey technique. An IBM 7090 computer was programmed to generate a best fitting log-spiral to each shoreline curve. Results ranged from excellent to good with the best fit being to Spiral Beach curvature, for which mean squared error in length of the log-spiral radius vector was only 0.82 feet squared. Constant spiral angle, a, ranged between 41.26 deg and 85.64 deg. Centers for three of the best fitting log-spirals lay in close proximity to the shoreward portion of each headland. (Sinha-OEIS)

FOOD HABITS OF THE COHO SALMON, ONCORHYNCHUS KISUTCH, IN LAKE MICHIGAN,
Wisconsin Univ., Milwaukee. Dept. of Zoology.
M. A. Harney, and C. R. Norden.
Trans Wis Acad Sci Arts Lett, 60, p 79-85, 1972, Illus.
Identifiers: *Coho salmon, *Food habits, Insects, *Lake Michigan, Oncorhynchus-kisutch, Salmon, Smelt, Stickleback.

The stomach contents of 36 coho salmon, O. kisutch, taken from southern Lake Michigan were examined. The contents were identified and numerical and volumetric methods were used to analyze the data. The results indicated that the coho salmon in Lake Michigan is primarily piscivorous. Fish comprised 96.9% by volume of the coho's diet and the alewife accounted for 62% of the total stomach contents. Other items included in the coho's diet were smelt, stickleback and insects.--Copyright 1973, Biological Abstracts, Inc.

Hydrobiologia, Vol 41, No 4, p 501-513, May 30, 1973. 10 fig, 8 ref.

Descriptors: *Ecology, *Systematics, *Protozoa, Dominant organisms, Sediments, Springs, Mosses, Water, Biological communities, Sampling, Aquatic animals, Invertebrates, Speciation.
Identifiers: *Testacea, Arcella spp, Centropyxis spp, Trigonopyxis arcula, Difflugia spp, Pontigulasia spp, Heleopera spp, Hyalosphenia papilio, Lesquereusia spiralis, Nebela spp, Quadrulella spp, Assulina spp, Corythion spp, Euglypha spp, Placocista spinosa, Sphenoderia spp, Tracheleuglypha dentata, Trinema spp, Valkanovia delicatula, Amphitrema flavum, Phryganella acropodia, Cyphoderia spp, Cryptodifflugia spp, Difflugiella sacculus, *Germany.

Taxonomy and ecology of Testacea in samples from Sphagnum and from sediments of a pool, some springs and small waters collected near Buschelbach (Bieber/Spessart, Germany) were studied. Eighty-nine species were found. The Euglyphidae, one of the 9 investigated families, dominated with Trinema (T. lineare, T. enchelys), Corythion (C. dubium), Assulina (A. muscorum), Euglypha (E. rotunda, E. laevis, E. cristata) and Sphenoderia (S. minuta). The Nebelidae, another of the 9 families, were also relatively frequent, especially Nebela (N. collaris-bohemica-tincta-group), Lesquereusia (L. spiralis) and Quadrulella (Qu. symmetrica). Specimens of the families Arcellidae, Centropyxidae and Difflugiidae were generally more rare. (Little-Battelle)

ENERGY BUDGET AND PHOTOSYNTHESIS OF CANOPY LEAVES,
California Univ., Los Angeles. Dept. of Geography.
W. H. Terjung, and S. S-F. Louie.
Annals of the Association of American Geographers Vol 63, No 1, p 109-130, March 1973. OWRR B-100-CAL (3) and B-121-CAL (3). 14-31-0001-3061 and 14-31-0001-3260 Amended.

Descriptors: Distribution patterns, *Photosynthesis, *Energy budget, Temperature, *Leaves, Canopy, *Radiation, Model studies.

The relation between leaves (broad and needle leaves) in a canopy and parts of the soil-atmosphere environment is modeled and analyzed. The parameters examined are concerned with short and longwave radiation, reradiation, and latent and convectional heat fluxes at the leaf level. The resulting leaf energy budget is empirically linked to a generalized model of potential photosynthesis whose major inputs are solar radiation and leaf temperature. The predictions of the combined process-response system do not attempt to portray existing plants, but are used to infer the trend of the major forcing and response funtions of leaves in general when exposed to a great variety of environmental conditions. Leaves in the topmost canopy exhibit the highest Bowen ratios and highest potential photosynthesis, whereas the opposite is the rule among interior leaves. During the growing season many middle latitude climates show higher potential productivity than moist, tropical climates.

Izdatel'stvo 'Nauka', Leningrad, 1970. 120 p.

Descriptors: *Hydrologic cycle, *Water balance, *Mountain forests, *Coniferous forests, *Coniferous trees, Pine trees, Fir trees, Ash trees, Precipitation (Atmospheric), Surface runoff, Subsurface runoff, Evaporation, Transpiration, Soil water, Infiltration, Snow cover, Water equivalent, Water storage, Retention, Conservation.
Identifiers: *Maritime Territory (USSR), Pluviograms, Chronoisopleths, Topoisopleths.

Long-term (1959-65) investigations of the hydrologic regime of mountain pine, fir, and ash forest trees in the Suputinka nature preserve, occupying about 17,000 hectares in the southern part of the Maritime Territory, have shown that forest plantings have an effect on major items in the water balance. Items examined include precipitation, soil water, surface and subsurface runoff, evaporation from soil surfaces and grass cover, transpiration of tree stands, and total evaporation. To improve moisture supply and increase water yield, pine and fir trees on mountain slopes of less than 15 deg steepness should be thinned to a density of 0.5

EXTENT TO WHICH THE TECHNIQUE EMPLOYED FOR THE BUILDING OF THE LIPTOVSKA MARA DAM HAS INFLUENCED ORNITHOCENOSES, (IN CZECH),
Komenskeho Universita, Bratislava (Czechoslovakia).
Z. Feriancova-Masarova, and O. Ferianc.
Biologia (Bratisl), Vol 27, No 2, p 141-146. 1972. (English summary).
Identifiers: Anthropophilous, Biotypes, Birds, *Czechoslovakia (Liptovska Mara Dam), Dams, Meadows, *Ornithocenoses, Woods, *Biotopes.

Dam building brings about the development of new water biotopes with consequent changes in the original ornithocenoses. Gradual changes in bird synusiae could be seen while dam construction was still in progress, as evidenced by studies of those parts of the Liptov Basin (Czechoslovakia) that were to be submerged and form the Liptovska Mara. Two biotopes were particularly affected by the dam construction (original wet meadows and the course of the Vah river. In the ornithocenoses of the vegetation covering the shores of the reservoir and of smaller woods, there was a decrease both in the number of species and of individuals of some species and a change in the composition of the bird communities by species. The field biotope was affected only in the building site itself. Some species of anthropophilous birds disappeared.--Copyright 1973, Biological Abstracts, Inc

STOMATAL RESISTANCE DURING SENESCENCE OF HARDWOOD LEAVES,
New Hampshire Univ., Durham. Inst. of Natural and Environmental Resources
G. W. Gee, and C. A. Federer
Water Resources Research, Vol 8, No 6, p 1456-1460, December 1972. 2 fig, 12 ref. OWRR A-025-NH (1)

Descriptors: *Leaves, *Stomata, *Moisture deficit, *Hardwood, *New Hampshire, Againg (Biological), Precipitation, Plant physiology, Surveys, Methodology, Chlorophyll, Seasonal, Diurnal, Moisture content, Diffusion, Transpiration.
Identifiers: Leaf color changes.

Leaf resistance to vapor flow was measured with a diffusion porometer on hardwood trees in central New Hampshire during autumn senescence and was compared with leaf color and chlorophyll content. Daytime diffusion resistance remained at the low values found in summer (1-10 sec/cm) as long as the leaves remained green. Resistances ranged from 5 to >35 sec/cm when chlorophyll content was below 0.4 mg/g of fresh weight and leaf color was yellow green or yellow. Autumn transpiration evidently continues unabated in green leaves but declines to small values when leaves turn color. (Woodard-USGS)

AN ANNOTATED LIST OF FISHES FROM THE UPPER SALT RIVER, KENTUCKY,
Louisville Univ., Ky. Dept. of Biology; and Louisville Univ., Ky. Water Resources Lab.
R. D. Hoyt, S. E. Neff, and L. A. Krumholz.
Kentucky Academy of Science Transactions, Vol 31, No 3-4, p 51-63, 1970. 3 fig, 12 ref. OWRR B-005-KY (4).

Descriptors: *Fish populations, *Fish taxonomy, *Fish types, *Pre-impoundment, *Kentucky, Reservoir sites, Baseline studies, Rivers, Streams, Wildlife management, Classification, Flood control, Reservoirs, Ecology, Environmental effects.
Identifiers: *Upper Salt River (Ky).

Three flood control impoundments are scheduled for construction on the Salt River and its two tributaries in Kentucky during the 1970's. Since the impoundment of the river will create three sizable bodies of water (4000 acres each) and will cause changes in the flora and fauna and influence downstream water quality, an intensive preimpoundment survey of the Salt River has been undertaken. Information gathered in this survey will permit an accurate appraisal of the various changes that will be brought about by impoundment of portions of the river system. This annotated list describes the relative abundance and distribution of fishes in the upper Salt River in order to correlate preimpoundment conditions with later postimpoundment conditions. The 5 predominant species in the area in order of abundance were Lepomis megalotis, Pimephales notatus, Notropis ardens, Lepomis cyanellus, and Campostoma anomalum. (Woodard-USGS)

Bull Soc R Bot Belg. Vol 103, No 2, p 383-396. 1970. (English summary).
Identifiers: *Phytogeochemical surveys, Alluvial vegatation, Banks, *Biomass, Chlorides, Fertility, Foliar, Geochemistry, Potassium, *Productivity, Silicon, Sodium, Soils, Streams, Surveys, *Vegetation, *Belgium.

A preliminary phytogeochemical study, based on polyelements and Na, Cl, and Si foliar analysis, was made on the riverine vegetation of the Gembes stream. Alluvial vegetation differs from more typical terrestrial vegetation by a generalized N richness and a nearly as general K poorness. Several phytochemical groups have been distinguished. High N content of the alluvial soils studied and good nitrification conditions probably account for high N level in the plants. The very coarse texture and K poorness of the soils may be considered as responsible for the very bad K plant nutrition--Copyright 1973, Biological Abstracts, Inc.

EFFECTS OF WATER STRESS, GIBBERELLIC ACID AND 2-CHLOROETHYLTRIMETHYLAMMONIUMCHLORIDE (CCC) ON FLOWER DIFFERENTIATION IN 'EUREKA' LEMON TREES,
Hebrew Univ., Rehovoth (Israel). Dept. of Agricultural Botany.
I. Nir, R. Goren, and B. Leshem.
J Am Soc Hortic Sci. Vol 97, No 6, p 774-778. 1972. Illus.
Identifiers: Anatomy, *Chlorides, Flowers, Gibberellic-Acid, Growth, *Lemon trees, Morphology, Trees, *Water stress.

Attempts were made to identify the stage of flower differentiation of subterminal buds under water stress conditions. Anatomical and morphological studies established that flower differentiation occurs during the stress period and that the generative bud formed does not undergo flower development until water is supplied. Gibberellic acid (GA) applied under normal irrigation conditions inhibited summer flower formation even when supplied after the first stages of flower bud differentiation, and stimulated vegetative growth of either 1 or 2 dormant axillary meristems. In contrast, 2-chloroethyltrimethylammoniumchloride induced flower formation when applied by the end of Aug. to irrigated trees. Treatments with GA under water stress conditions prevented flower formation but were inactive when applied after the renewal of irrigation and beginning of anthesis.--Copyright 1973, Biological Abstract, Inc.

GERMINATION STUDIES ON SOME ANNUAL SPECIES FROM AN ARID REGION OF WESTERN AUSTRALIA,
Western Australia Univ., Nedlands. Dept. of Botany.
J. J. Mott.
J Ecol. Vol 60, No 2, p 293-304. 1972. Illus.
Identifiers: Annual species, Arid land, Aristida-contorta, *Australia (Murchison region), *Germination (Annualplants), Grasses, Helichrysum-cassinianum, Helipterum-craspedioides, Rain, Seasonal, Temperature.

Assessments of numbers of annual plants in the arid Murchison Region showed a marked seasonal variation in floral composition. Summer rain produced a predominance of grasses, while winter rains resulted mainly in the growth of dictyledons. Incubation of topsoil under warm conditions yielded flora of a summer type, while cooler conditions resulted in germination of typical winter vegetation. Determination of the germination characteristics of Aristida contorta, Helipterum craspedioides and Helichrysum cassinianum, indicates that the control of seasonal germination may be at first due to dormancy of the young seed of each species, and subsequently to temperature requirements. Germination of these species may be controlled by the necessity of the surface seed to remain moist for some time before germinating so that a heavy rain is required for germination and establishment.--Copyright 1973, Biological Abstracts, Inc.

SEASONAL WATER MOVEMENT IN TREE STEMS,
Forest Service (USDA), Corvallis, Oreg. Forestry Sciences Lab.
P. W. Owston, J. L. Smith, and H. G. Halverson.
For Sci. Vol 18, No 4, p 266-272. 1972. Illus.
Identifiers: Abies-magnifica, Forests, Phosphorus-32, *Pinus-contorta, Seasonal, Transpiration, *Tree stems, Water movement, *California, *Fir.

Water movement in boles of 60-yr-old lodgepole pine (Pinus contorta Dougl.) and red fir (Abies magnifica A. Murr.) in the Sierra Nevada of California was estimated by monitoring the ascent of 32p injected into small roots. Daytime rates of ascent for both species was 12-84 cm/hr in summer. No movement occurred in lodgepole pine during winter. Winter rates for red fir averaged 0.4-1.4 cm/hr. In Oct., volume of daytime water movement was estimated to be 1.3-5.3 1/hr in boles of individual trees. The technique may be used to estimate transpiration from a forest area. Expanding the volume of water transport to a hypothetical hectare of forest gave a transpiration rate of 0.16 cm/day in Oct.--Copyright 1973, Biological Abstracts, Inc.

PREDICTION OF SITE INDEX OF LODGEPOLE PINE FROM SELECTED ENVIRONMENTAL FACTORS,
Colorado State Univ., Fort Collins. Dept. of Forest Science.
E. W. Mogren, and K. P. Dolph.
For Sci. Vol 18, No 4, p 314-316. 1972.
Identifiers: Annual, Environmental factors, Moisture, Particle size, *Pine (Lodgepole), Pinus-contorta, Precipitation, Prediction, *Site index, Soils, Solum, Stoniness, *Colorado, *Wyoming.

Site index and selected soil, climatic, and topographic characteristics were recorded for 72 1/4 acre plots in well-stocked, even-aged lodgepole pine (Pinus contorta Dougl.) stands in north-central Colorado and south-central Wyoming. Within the range of the area examined, site index can be estimated using 4 environmental variables: percent of soil particles larger than 0.25 mm in diameter in the A horizon; total solum depth in inches; estimated percent of surface stoniness; and average annual percipitation in inches. The prediction equation derived from multiple regression analysis accounted for 78% of the variance in site index, with most variation (58%) due to particle size.--Copyright 1973, Biological Abstracts, Inc.

FOOD AVAILABILITY AND CONSUMPTION BY YOUNG CONNECTICUT RIVER SHAD ALOSA SAPIDISSIMA,
Holyoke Community Coll., Mass. Dept. of Biology.
R. C. Levesque, and R. J. Reed.
J Fish Res Board Can, Vol 29, No 10, p 1495-1499, 1972, Illus.
Identifiers: Alosa-sapidissima, *Connecticut River, Crustaceans, Food habits (Fish), Insects, Larvae, Rivers, *Shad, Tendipedid, Trichoptera.

Food habits of young A. sapidissima were studied in the Connecticut River above Holyoke, Massachusetts in 1969. Diurnal feeding data revealed a peak in stomach content volume at 8:00 PM during midsummer. Larval shad fed mainly on aquatic crustaceans and tendipedid larvae and pupae. Juveniles ingested the most abundant organisms: crustaceans, tendipedid larvae and pupae, hydropsychid larvae and adult insects. Electivity data indicated positive selection for tendipedid pupae and crustaceans and negative selection for hydropsychid larvae and tendipedid larvae. Selection of Trichoptera larvae by young shad in significant amounts was documented.--Copyright 1973, Biological Abstracts, Inc.

SOIL AERATION AND SITKA SPRUCE SEEDLING GROWTH IN PEAT,
Northern Forest Research Center, Edmonton (Alberta).
J. C. Lees.
J Ecol, Vol 60, No 2, p 343-349, 1972, Illus.
Identifiers: Diffusion, Growth, Oxygen, *Peat, Picea-sitchensis, Seedlings, Sitka spruce, *Soil aeration, *Spruce, Sulfides.

A 30 deg slope was created in deep peat in situ and extended up from the water-table at 91 cm depth to 46 cm above ground surface level. Rows of 8-wk-old Sitka spruce (Picea sitchensis (Bong.) Carr.) seedlings in plastic tube containers were planted along the gradient from 0-137 cm above water-level. At 5-7 weekly intervals, during a 4-mo. growing season, soil aeration was assessed along the slope by means of a polarographic technique to determine oxygen diffusion rates (O.D.R.). A soil aeration gradient was sustained throughout the season from the water-level to the top of the slope. Seedling height growth and oven-dry weights measured at the end of the growing period closely followed the soil aeration gradient. Sulfide concentrations at the poorly aerated lower end of the slope may have contributed to mortality among seedlings there. Seedling roots did not emerge from the containers into the pea until a level of 51-61 cm above water and an O.D.R. of c. 4 x 10-8g O2/cm2/min were reached. At the top of the slope, where O. D. R. increased to c. 10-15 x 10-8 g O2/cm2/min, the seedlings made satisfactory shoot and root growth.--Copyright 1973, Biological Abstracts, Inc.
W73-14744

A CIRCUIT FOR A SELF-TIMING STOMATAL DIFFUSION POROMETER,
New South Wales Inst. of Technology, Sydney (Australia). School of Life Sciences.
P. Kenny, and P. J. McGruddy.
Agric Meteorol, Vol 10, No 4/5, p 393-399, 1972, Illus.
Identifiers: Humidity, *Measurement, *Porometer, *Stomatal diffusion.

Current stomatal diffusion porometers generally involve the measurement with stop-watch of the time taken for the cup humidity to increase from one given value to another while the cup is clamped on a leaf. The necessity of closely observing the meter movement while simultaneously holding the porometer head and circuit box, operating the stop-watch and shading the leaf leads to a degree of operator inconvenience. A circuit has been developed which automatically records this time on a digital counter and allows wide adjustment of the humidity range scanned. Facilities for measuring leaf and cup temperature and their difference are also incorporated. The instrument is battery operated and portable.--Copyright 1973, Biological Abstracts, Inc.

RELATIVE DETACHABILITY OF SOIL PARTICLES BY SIMULATED RAINFALL,
Forest Service (USDA), Ogden, Utah. Intermountain Forest and Range Experiment Station.
E. E. Farmer.
Soil Science Society of America Proceedings, Vol 37, No 4, p 629-633, July-August 1973. 3 fig, 4 tab, 12 ref.

Descriptors: *Soil erosion, *Impact (Rainfall), *Overland flow, Rainfall, Energy, Erosion, Rainfall intensity, Simulated rainfall, Particle size.
Identifiers: Splash erosion.

Disturbed surface soil masses of two coarse-grained granitic soils and a single fine-textured clay soil were subjected to simulated rainfall. The relative detachability of 11 soil-size fractions was determined by comparing the proportion of a given size fraction in the pretreatment soil mass with the proportion of that size fraction in the splashed soil. Tests were conducted under two levels of rainfall intensity, three degrees of slope steepness, and in the presence or absence of overland flow. Effects of rainfall intensity and slope steepness were small. Overland flow had a pronounced effect on particle detachment resulting from raindrop impact. Without overland flow, soil particle sizes in the range of 110-1,450 micrometers were most susceptible to detachment by raindrop impact. With overland flow, the susceptible size range was 219-2,034 micrometers. (Knapp-USGS)

THE PROBLEM OF ASSESSING THE EROSIVE POWER OF RAINFALL FROM METEOROLOGICAL OBSERVATIONS,
Commonwealth Scientific and Industrial Research Organization, Canberra (Australia). Div. of Soils.
P. I. A. Kinnell.
Soil Science Society of America Proceedings, Vol 37, No 4, p 617-621, July-August 1973. 1 fig, 6 tab, 26 ref.

Descriptors: *Soil erosion, *Impact (Rainfall), Rainfall, Energy, Erosion, Rainfall intensity.

A number of rainfall parameters are used as bases for indexes of erosivity. Values for three such parameters--momentum, kinetic energy, and kinetic energy per unit horizontal area of the drop--were calculated from drop-size data. Relationships between rainfall intensity and the parameters were developed. Both raintype and geographic location influenced the parameter values. This suggests that the detachment ability of rainfall, at a given rainfall intensity, may vary between raintypes and geographic locations. However, the degree and direction of the influence depended on which parameter was being considered. The ordering of five raintypes at Miami, Florida, determined by values obtained at given rainfall intensity from the intensity-parameter regressions for momentum and kinetic energy was reversed for kinetic energy per unit horizontal area of the drop. Therefore, in the absence of data on the rate of soil detachment, it is not possible to classify the raintypes at a geographic location according to their detachment power. Rainfall parameters may only be evaluated as indexes of the detachment power of rainfall if they are determined directly and simultaneously with soil loss, and provided that the influence of runoff on soil loss is taken into account. (Knapp-USGS)

CHANGES IN BEACH PROFILES AT CHEDABUCTO BAY, NOVA SCOTIA, FOLLOWING LARGE-SCALE REMOVAL OF SEDIMENTS,
Bedford Inst., Dartmouth (Nova Scotia). Atlantic Geoscience Center.
E. H. Owens, and G. Drapeau.
Canadian Journal of Earth Sciences, Vol 10, No 8, p 1226-1232, August 1973. 3 fig, 9 ref.

Descriptors: *Beach erosion, *Beaches, Sediment transport, Sedimentation, Oil spills, *Canada, Profiles, Surf, Pollution abatement.
Identifiers: *Chedabucto Bay (N.S.).

The effects of sediment removal on three beaches were monitored during a 1-year period following attempts to clean up an oil spill in Chedabucto Bay, Nova Scotia. Profiles of these beaches are compared with those surveyed on a high energy beach on Crichton Island which was not affected by cleaning operations. It is apparent on beaches affected by cleaning operations that sediments removed from areas beyond the limit of normal wave action have not been replaced. Excessive sediment removal can seriously alter the equilibrium of a beach and this was demonstrated by a 20-m retreat of the beach crest at the eastern end of Indian Cove. (Knapp-USGS)

ADVANCES IN NEAR-SHORE PHYSICAL SEDI MENTOLOGY: A SELECTIVE REVIEW,
Florida State Univ., Tallahassee. Dept. of Geolo gy.
W. F. Tanner.
Shore and Beach, Vol 41, No 1, p 22-27, Apr 1973. 1 fig, 24 ref.

Descriptors: *Beach erosion, *Sedimentatio *Beaches, *Reviews, Sediment transport, Surf Waves (Water), Sediment yield

Wave energy concepts important in coastal studie are reviewed. In the general sense, coasts ma have high, moderate, low, or even zero energy Processes appear to be easier to study o moderate-to-low energy coasts. Each segment o coast is either in nonequilibrium, subequilibriu or equilibrium. Equilibrium is a more-or-less sel correcting balance among energy, sediment an three-dimensional geometry. An equilibriu beach, for example, may maintain its equilibriu geometry, and nevertheless shift its position land ward (erosion) or seaward (accretion). These case may be examples of equilibrium-of-scarcity an equilibrium-of-abundance. There is considerabl evidence that, during the last five centuries, man of the beaches of the world have changed fro abundance to scarcity. Sand budget studies in volve the determination of quantities of san eroded, moved, and deposited in a single coasta compartment or cell. On low-to-moderate energ beaches, it may be easy to balance the san budgets. A single cell may contain subcells between which leakage is rather important. Th compartments which are reasonably well isolate from each other tend to have a size which is pro portional to the general energy level. Cell bounda ries may be zero energy segments, bay heads wide inlets or estuaries, rocky headlands, or cape based sandy shoals (very large transverse bars Studies of energy partitioning show that, in a few cells which have been examined in detail, tota sediment transport absorbs a few percent of th overall wave energy available, and ne unidirectional transport (net littoral drift) absorb a few hundredths or a few tenths of one percent o total wave energy. COASTAL ICE FORMATION AND ITS EFFEC ON BEACH SEDIMENTATION,
Western Michigan Univ., Kalamazoo. Dept. o Geology.
R. A. Davis, Jr.
Shore and Beach, Vol 41, No 1, p 3-9, April 1973 10 fig, 5 ref.

Descriptors: *Beaches, *Ice, *Beach erosion *Great Lakes, Sedimentation, Freezing, Melting Waves (Water), Surf, Ice cover, Iced lakes, Sedi ment transport, Seasonal.

Formation of coastal ice causes sudden and strik ing seasonal changes in normal coastal processes The backbeach and foreshore zone are the first t be affected as the beach freezes and an icefoo forms. At this stage, waves and currents are essen tially unaffected. As temperatures continue t decline, various forms of ice accumulate acros the nearshore zone, with large ice ridges being th most prominent features. The ice cover prevent waves and longshore currents from acting upo the beach and nearshore zone. As a result thes areas become static during the period of ice cover Initial melting and subsequent runoff produces nu merous temporary deltas, which are protecte from wave attack by the ice ridges. Ice meltin along the foreshore zone exposes small ice-pus features, large kettle-like depressions, and generally irregular shoreline. Eventually the ic ridges break up and thereby allow waves to reac the beach. In a matter of hours the beach regain its usual character and all evidence of ice cover i destroyed. (Knapp-USGS)

program which uses all available data from stan-rd sedimentological analyses, regardless of the i interval, and which computes statistical rameters by direct integration of a linear ap-oximation to the cumulative curve was reviewed r its use in conjunction with sieve intervals in ain size analysis for interpretation of sedimenta- environments. The 0.25 phi interval produces ore accurate and more meaningful results unless ta can be obtained for values smaller than this terval. Although fitting a higher order equation the cumulative curve would produce more con-stent results for the 0.25, 0.5 and 1.0 phi inter-ls, there is no practical or theoretical justifica-n for choosing any particular family of curves to a cumulative curve of this description. There-re, a linear approximation is justified by its com-nation of simplicity and objectivity. (Knapp-SGS) 73-14576

COMPOSITION OF SAND RELEASED FROM THREE SOURCE AREAS UNDER HUMID, LOW RELIEF WEATHERING IN THE NORTH CAROLINA PIEDMONT,
North Carolina State Univ., Raleigh. Dept. of Geosciences.
W. R. Mann, and V. V. Cavaroc.
Journal of Sedimentary Petrology, Vol 43, No 3, p 870-881, September 1973. 5 fig, 4 tab, 22 ref.

Descriptors: *Sands, *Provenance, *Weathering, *Mineralogy, *North Carolina, Climates, Topography, Sedimentology, Leaching.

The petrographic composition of sand-size sediment released by granitic, micaceous metamorphic, and first cycle sedimentary source areas was investigated in a portion of the North Carolina piedmont province. The region is characterized by a moist climate and low relief, resulting in moderate to heavy chemical weathering of the source rocks. Despite significant variation between sample sites within source areas, as well as appreciable in situ degradation of the chemically less stable grain types, mineralogical differences between sands from the three sources can be detected. Strong over-riding composition-sediment size relationships, however, tend to obscure the differences. These size correlations, which differ between source areas, reflect a characteristic imprint of the source lithology on sands released by weathering, and may be useful in differentiating the sand's origin. THE EFFECT OF GRAIN ORIENTATION ON FOURIER SHAPE ANALYSIS,
Michigan State Univ., East Lansing. Dept. of Geology.
S. E. Tilmann.
Journal of Sedimentary Petrology, Vol 43, No 3, p 867-869, September 1973. 1 fig, 10 ref.

Descriptors: *Particle shape, *Particle size, *Fourier analysis, Sedimentology, Statistics, Statistical methods.

The Fourier shape analysis of 50 unconsolidated sand-sized quartz grains in their maximum projection plane were compared to the shape of these same grains in orientations that depart radically from the maximum projection plane. The results indicated that the shape information carried by quartz grains while in their plane of maximum projection does not differ significantly from the shape information carried by such grains while in other planes of orientation. THE PROBLEM OF BEACH CUSP DEVELOPMENT,
Glamorgan Polytechnic, Pontypridd (Wales).
A. T. Williams.
Journal of Sedimentary Petrology, Vol 43, No 3, p 857-866, September 1973. 4 fig, 2 tab, 21 ref.

Descriptors: *Beaches, *Sand waves, *Surf, Beach erosion, Sedimentary structures, Rip currents, Coasts, Waves (Water), Geomorphology.
Identifiers: *Hong Kong.

Cusp development on three Hong Kong beaches was studied during 1970-71, and measurements of cusp dimensions and sea state parameters were obtained. Grain-size distribution as well as permeability differences were found between horns and bays. There appeared to be a tentative correlation between the degree of bay exposure and cusp spacing. Statistical analysis revealed predominance of swash length in explaining cusp spacing, and this together with wave period and breaker height explained 55% of the spacing in the measured cusps. A depositional origin of horn accumulation was demonstrated by means of fluorescent tracers, and a distinction was observed between cusp development by strong swash and gentle swash. (Knapp-USGS) W73-14579

A SPECIAL MECHANISM FOR VARVE FORMATION IN A GLACIAL LAKE,
Department of Energy, Mines and Resources, Burlington (Ontario). Canada Center for Inland Waters.
C. I. Dell.
Journal of Sedimentary Petrology, Vol 43, No 3, p 838-840, September 1973. 1 fig, 6 ref.

Descriptors: *Varves, *Lake Superior, *Sedimentation, Pleistocene epoch, Stratigraphy, Deposition (Sediments), Diagenesis, Sedimentation rates, Carbonates, Calcite, Calcium carbonate, Leaching.

One of the major stratigraphic units in Lake Superior is a sequence of gray varved clays formed in late-glacial time. The sediment was carried into the lake by meltwater streams flowing from the region of gray calcareous tills in the northern part of the basin. During the summer when the sedimentation rate was high, the carbonates were rapidly buried and a highly calcareous layer preserved. During the winter the sedimentation rate was greatly reduced, the carbonates were partially dissolved by the cold lake water and a low-carbonate winter layer formed. (Knapp-USGS) W73-14581

PHYSICAL PROPERTIES AND SUSPENDED MATTER OF SURFACE WATERS IN THE SOUTHEASTERN ATLANTIC OCEAN,
Woods Hole Oceanographic Institution, Mass.
K. O. Emery, J. D. Milliman, and E. Uchupi.
Journal of Sedimentary Petrology, Vol 43, No 3, p 822-837, September 1973. 13 fig, 32 ref. NSF Grant GA-28193.

Descriptors: *Suspended load, *Atlantic Ocean, *Ocean currents, Ocean circulation, Productivity, Sampling, Oceanography.

Samples of suspended matter in surface waters were obtained at about 750 stations in the southeastern Atlantic Ocean. Concentrations were related to patterns of upwelling as outlined by observations of wind direction and speed, surface water temperature, salinity, and color, seabird distribution and abundance, and the surface current pattern. The suspended matter is chiefly organic in origin owing to the high productivity of upwelled water on the continental shelf and south of the Subtropical Convergence. (Knapp-USGS) W73-14582

DISTRIBUTION AND COMPOSITION OF SUSPENDED SEDIMENT IN THE BOTTOM WATERS OF THE WASHINGTON CONTINENTAL SHELF AND SLOPE,
Washington Univ., Seattle. Dept. of Oceanography.
E. T. Baker.
Journal of Sedimentary Petrology, Vol 43, No 3, p 812-821, September 1973. 4 fig, 1 tab, 27 ref. AEC Contract AT (45-1)-2225-T24.

Descriptors: *Suspended load, *Clay minerals, *Columbia River, Continental shelf, *Washington, Provenance, Sedimentology, Sedimentation, Mineralogy, Montmorillonite.
Identifiers: Chlorite.

Samples of suspended load were collected at 26 stations from the lower Columbia River and bottom waters of the adjacent continental shelf and slope during the summer and early fall of 1971. X-ray diffraction analysis shows the montmorillonite/chlorite ratio to be a useful indicator of Columbia River-derived sediments; values vary from high (>1.0) in the Columbia River and shelf

bottom waters, through moderate (0.96-0.65) in the head and upper reaches of three major submarine canyons on the slope, to low (< 0.48) in samples from the distal portions of the canyons and the open slope areas between the canyons. Physical sedimentary processes, such as differential sedimentation and resuspension result in a continually changing clay mineral composition of the suspended load as its diffuses into the coastal ocean environment. These changes in clay mineralogy are not caused by dilution of the Columbia River suspensate or transformation of the clay minerals due to reactions with seawater. (Knapp-USGS)

ORIGIN AND DISTRIBUTION OF SANDS AND GRAVELS ON THE NORTHERN CONTINENTAL SHELF OFF WASHINGTON,
Lamont-Doherty Geological Observatory, Palisades, N.Y.
K. Venkatarathnam, and D. A. McManus.
Journal of Sedimentary Petrology, Vol 43, No 3, p 799-811, September 1973. 7 fig, 3 tab, 30 ref. USGS Contracts 14-08-0001-10924 and 14-08-0001-11995.

Descriptors: *Sands, *Gravels, *Continental shelf, *Provenance, *Sedimentation, Pleistocene epoch, Washington, Glacial drift, Littoral drift, Sedimentology, Mineralogy.

Nearshore sands on the northern Washington shelf have high percentages of clinopyroxene, garnet, and amphibole that indicate local sediment supply along the coast. Orthopyroxene, which characterizes the Columbia River sediment, does not form a significant proportion of these sands, as it does in the nearshore sands to the south, between Grays Harbor and the Columbia River. In contrast to these differences, a heavy mineral-rich zone at 44 to 51 m has relatively abundant orthopyroxene all along the shelf, especially in the southern part. This indicates that orthopyroxene-rich sediments were more abudantly supplied to the southern part of the shelf in the past, or that the northward sediment drift was stronger than at present, possibly due to the lack of headlands. The Chehalis River could have delivered considerable quantities of sediment during the Pleistocene. Glacial outwash exiting through Grays Harbor during lowered sea level supplied the gravel found on the adjacent inner, middle, and outer shelf. Except near the Columbia River where a blanket of modern silt covers the shelf, anomalously coarse deposits rich in heavy minerals are found discontinuously at depths of 18 to 33 m, 44 to 51 m, has relatively abundant orthopyroxene all along the shelf, especially in the southern part. LONGITUDINAL RIPPLES FORMED BY OVERLAND FLOW AND TIDAL CURRENTS,
Colorado State Univ., Fort Collins. Dept. of Geology.
M. P. Mosley.
Journal of Sedimentary Petrology, Vol 43, No 3, p 795-798, September 1973. 2 fig, 1 tab, 9 ref.

Descriptors: *Ripple marks, *Overland flow, *Sheet erosion, *Waves (Water), Unsteady flow, Non-uniform flow, Soil erosion, Surf, Tides, Model studies, Hydrologic models, Sediment transport, Sedimentation, Erosion.
Identifiers: Tidal currents.

Longitudinal ripple marks similar in size and appearance to those reported on tidal mudflats developed under the influence of artificial precipitation and overland flow during an experimental study of soil erosion. They appeared to be an upslope extension of the incised channel system, accomplishing the most efficient evacuation of water from the experimental surface. The longitudinal ripples formed under overland flow tended to be more sinuous and to branch more frequently than those formed by tidal currents. In terms of fluid flow dynamics, longitudinal ripples formed under overland flow and tidal flow may be functionally similar, but environmental conditions are quite different. That these features may develop in different environments may introduce some difficulty into interpretation of such forms found in the geologic record. (Knapp-USGS)

EVALUATION OF A CONCEPTUAL MODEL FOR THE TRANSVERSE SEDIMENT TRANSPORT SYSTEM OF A COASTAL BARRIER CHAIN, MIDDLE ATLANTIC BIGHT,
Old Dominion Univ., Norfolk, Va. Dept. of Geophysical Sciences; and Old Dominion Univ., Norfolk, Va. Inst. of Oceanography.
G. L. Shideler.
Journal of Sedimentary Petrology, Vol 43, No 3, p 748-764, September 1973. 4 fig, 2 tab, 32 ref.

Descriptors: *Beaches, *Sediment transport, *Barrier islands, Particle size, Sedimentary structures, Sedimentation, Beach erosion, Surf.

Comparative size analyses of adjacent foreshore, berm, and dune sediments were conducted along a coastal barrier chain of the Middle Atlantic Bight between Cape Henry, Virginia and Cape Hatteras, North Carolina. The three genetic populations exhibit statistically significant textural differences. Their textural attributes are interpreted in terms of a proposed conceptual model for the transverse transport system of barrier sediments. During fair weather conditions, barrier sediments are subjected to environmental processes resulting in the acquisition of distinctive textural response characteristics. The foreshore population is generated largely through aqueous processes associated with the normal swash-backwash regime, with only minor response to aeolian processes; whereas the berm population is generated by high water swash-backwash regimes, and is substantially modified by subsequent aeolian processes. The dune population is generated entirely by the aeolian regime, and represents a clastic filtrate derived from adjacent berm and aeolian flat deposits. The distinctive response characteristics of the three genetic populations tend to be obliterated by interpopulation feedback, and through storm homogenization by washover fans. Characteristic textural responses appear to be determined both by the types of processes and by their relative effectiveness. (Knapp-USGS)

NEW METHOD OF FORECASTING MUDFLOWS FROM THUNDERSTORMS (NOVYY METOD PROGNOZIROVANIYA SELEVYKH POTOKOV PO GROZAM),
Akademiya Nauk SSSR, Moscow. Institut Geografii.
S. S. Korzhuyev.
Akademiya Nauk SSSR Izvestiya, Seriya Geograficheskaya, No 2, p 99-104, March-April 1972. 1 fig.

Descriptors: *Mudflows, *Thunderstorms, *Forecasting, Cloudbursts, Precipitation (Atmospheric), Mountains, Correlation analysis, Equations.
Identifiers: USSR, *Turkmen SSR, *Kopet-Dag.

A new method is proposed for forecasting mudflows from thunderstorm runoff. On the basis of 30 years of data, a close relation is established between thunderstorms and mudflow activity in the mudflow-risk mountainous region of Kopet-Dag in southern Turkmenistan. The number of thunderstorms during this period was 377, and the number of mudflows was 291. The coefficient of correlation is 0.972 plus or minus 0.067. (Josefson-USGS)

BASIC PATTERNS IN THE GEOLOGIC ACTIVITY OF STREAMS IN MOUNTAINOUS AREAS (OSNOVNYEE ZAKONOMERNOSTI GEOLOGICHESKOY DEYATEL'NOSTI REK GORNYKH STRAN),
Akademiya Nauk SSSR, Moscow. Geologicheskii Institut
I. P. Kartashov
Akademiya Nauk SSSR Geologicheskiy Institut Trudy, No 245, Moscow, 1972. 184 p

Descriptors: *Geology, *Topography, *Sedimentation, *Stream erosion, *Equilibrium, Aggradation, Degradation (Stream), Abrasion, Rivers, Streams, Gradients (Streams), Meanders, Channels, Flood plains, Deltas, Alluvium, Terraces (Geologic), Mountains, Profiles, Mapping
Identifiers: USSR, *Yakutsk ASSR, Khabarovsk Territory, Magadan Oblast, Placers, Planation.

Geologic activity of streams is divided into 3 main stages--downcutting, aggradation, and dynamic equilibrium--and 2 transitional stages--stream abrasion (transition from downcutting to equilibrium), and floodplain constriction (transition from aggradation to equilibrium). Formation of topography, alluvium, and placers is examined, and characteristics of these processes in each stage of river development are discussed. The genetic classification of fluvial topographic forms, alluvium, and placers developed by the author reflects the dynamics of development of these formations and the interrelations between different fluvial geologic processes. Factual data for analyzing interrelationships between relief-forming and rock-forming activities of streams are based on many years of investigations of gold placer deposits in the Yakutsk ASSR, Khabarovsk Territory, and Magadan Oblast. COASTAL MOVABLE-BED SCALE-MODEL RELATIONSHIP,
Tetra Tech, Inc., Pasadena, Calif.
E. K. Noda.
Prepared for Army, Coastal Engineering Research Center. Final Report, TETRAT-P-71-191-1, March 1971. 119 p, 36 fig, 3 tab, 20 ref, 3 append. DACW 72-70-C-0021.

Descriptors: Beaches, *Coasts, *Sediments, *Waves (Water), Littoral.
Identifiers: *Beach profiles, *Longshore bar formation, Scale models, Mass transport, Near shore processes.

The problem of determining the existence of a model law for coastal movable bed scale models is considered. An experimental program has been performed and the extensive laboratory beach profile data indicate a relationship or model law between the four basic scale ratios: the horizontal scale, vertical scale, sediment size ratio and the relative specific weight ratio. To determine the validity of the experimentally derived model law a prototype dimension beach profile is modeled in the laboratory and the results show good correlation. Since this law is fundamental to all beach profiles a 'criterion of longshore bar formation' is proposed which successfully correlates the available data on the formation of 'winter' and 'summer' type beach profiles. Recommendations are presented to optimize the practical application of scale model technology to coastal movable beds. Information is also presented on the physical and handling properties of many materials to determine their applicability as possible model sediments. Graphical forms of the experimentally derived model law are presented for efficient use. In an appended paper B. Le Mehaute presents a comparison of fluvial and coastal similitude. Le Mehaute suggests that despite the fact that the knowledge in sediment transport by wave action is less advanced than in the case of steady currents, the conditions of similitude for beaches are less stringent than for rivers. An introduction to a natural law of distortion for beaches is presented in

analogy with the Lacey condition for rivers. (Sinha-OEIS)

COASTAL PROCESSES AND BEACH EROSION,
Army Coastal Engineering Research Center, Washington, D.C.
J. M. Caldwell.
Journal of the Society of Civil Engineers, Vol 53, No 2, p 142-157, April 1966. 3 fig, 5 tab, 7 ref. (Also issued as Army Coastal Engineering Research Center R. 1-67, January 1967.)

Descriptors: Beaches, Erosion, *Beach erosion, *Coastal engineering, Ocean waves, Storms, Fluid flow, *Littoral drift, Inlets (Waterways), Shores, *Shore protection, Deposition (Sediments), *Tidal effects, Waves (Water).
Identifiers: *Near shore processes, Wave overtopping.

Fundamentals of coastal processes and their application to selected engineering problems are set forth. The beach face is an active zone with a constant shuttling of the sands back and forth along the shore. Permanent beach losses occur along most of our shores due to: (a) an excess of littoral drift leaving a given sector; (b) material lost inland by the tidal action of inlets; and (c) material pulled offshore into deep water by local storms. The first two losses are permanent losses; the third loss may or may not be permanent depending on local conditions. The continuing erosion of a beach narrows the beach to where it is extremely vulnerable to severe erosion and wave overtopping during severe storms. The proper solutions to our many shore erosion problems involve basically a quantitative evaluation of the overall processes causing the erosion followed by the development of a plan to either prevent or to compensate for these losses. SEA-LEVEL RISE AS A CAUSE OF SHORE EROSION,
Florida Univ., Gainesville. Coastal Engineering Lab.
P. Bruun.
Journal of the Waterways and Harbors Division, American Society of Civil Engineers, Vol 88, No WW1, Proceedings paper 3065, p 117-130, February 1962. 4 fig, 14 ref.

Descriptors: *Erosion, Sea level, Shores, *Beach erosion, Geologic history, Sediment, *Littoral drift, *Florida, Coasts, Estuaries.
Identifiers: Near shore processes, Accretion, Equilibrium profile, *Beach profiles.

Geological history which points to the relationship between sea level variations and beach erosion is reviewed. Consideration is given to the equilibrium profile theory. It is suggested that a rise of 0.3 m may come in 50 to 100 years and will have serious consequences for erosion along Florida shores, because it may give rise to shoreline recessions of the order of 100 ft or more on the southwest coast. There may be a time lag between the rise of the water table and the reaction in the form of erosion. This lag is more pronounced for the gentle sloping, northeastern Florida shores, than for the steep southeastern Florida shores where reactions to fluctuations come more rapidly. These steep shores present less stability than the flat shores and any change from rising to lowering, or neutral position of the sea table seems to be reflected more rapidly in these steep-slope shores. With gentle-slope shores there may be more phase-lag between rise of sea level and erosion. This steep-slope shores with lowering of sea level may stop eroding before the gentle-slope shore slowly turns a tendency to erosion into a tendency to accretion. All this is based on the assumption that these shores are equilibium profile shores with maturity of configurative development. (Sinha-OEIS)

TRACING BEACH SAND MOVEMENT WITH IRRADIATED QUARTZ,
Scripps Institution of Oceanography, La Jolla, Calif.
T. K. Chamberlain.
Journal of Geophysical Research Vol 64, No 1, p 41-47, January 1969. 5 fig, 2 tab, 8 ref.

Descriptors: *Beaches, *Sediment transport, Sand, Quartz, Tracers, *Erosion, *Deposition (Sediments), California, Waves (Water).
Identifiers: Irradiated quartz sand, Radioactive tracers.

The mechanics of transportation of sand under the influence of wave action was studied using artificially induced radioactivity. A sample of naturally occurring quartz sand is taken from the area of study, subjected to slow neutron irradiation, and then reintroduced into the area. The movement of the quartz is traced by sampling the sediment on the bottom and assaying for phosphorus-32, which is the principal radio isotope formed from the slow neutron irradiation of natural quartz sands. In a field experiment, 860 g of irradiated quartz sand was reintroduced as a point source on the sea floor off Scripps Beach. The experiment showed that the dispersal of sand by wave action was more rapid than expected, and that the movement of this small amount of sand could be followed for about 7 to 24 hr. The irradiated sand was released on the bottom by divers and samples were obtained on a grid at the time intervals of 1/4, 1, 3 1/2, 7 1/2, and 24 hr, and several days later. At the point of introduction the water was 10 ft deep and the surface waves were about 1 1/4 ft high. The waves caused the sand to spread in an elliptical pattern with an elongate onshore-offshore axis. The sampling indicated that the 860 g of irradiated fine sand had been dispersed over an area of approximately three-quarters of a square mile in 24 hr. The sensitivity of detection for this experiment was approximately 1 grain of sand in 100,000. (Sinha-OEIS)

FLUORESCENT TRACER PARTICLE DETERMINATION OF THE SIZE-VELOCITY RELATION FOR FORESHORE SEDIMENT TRANSPORT, SANDY HOOK, NEW JERSEY,
Virginia Polytechnic Inst., Blacksburg. Dept. of Geological Science.
W. E. Yasso.
Journal of Sedimentary Petrology Vol 35, No 4, p 989-993, December 1965. 3 fig, 1 tab, 8 ref. Proj NR 388-057, Nonr 266 (68).

Descriptors: *Sediment transport, *Particle size, Ocean waves, Beaches, *New Jersey, Coasts, *Tracers.
Identifiers: *Sandy Hook (NJ), Size-velocity relations, *Fluorescent tracers, Near shore processes.

Each of four size classes of foreshore sand from Sandy Hook, New Jersey, was color coded with daylight and ultraviolet fluorescent coating material. These tracer particles were introduced at midswash line on the foreshore surface at Kingmill Beach, Sandy Hook, two hours prior to high tide. During the test Atlantic Ocean waves approaching at an angle of approximately 5 degrees to the shoreline caused 5.3-second breakers of 0.73 meter maximum height. In a time-integration procedure samples were obtained by channel sampling on the foreshore along a sampling line, transverse to the foreshore, that was established 30.5 meters downdrift from the point of introduction of tracer particles. Sub-samples of the 18 samples taken during the 49.7 minutes after marked particle introduction were examined for tracer particle content. Recovery data indicate particles in the smallest size class began arriving at sampling line 18.2 plus or minus 0.7 minutes after introduction: equivalent to 2.8 cm/sec average maximum transport velocity. Particles in the next largest size class began arriving 25.8 plus or minus 1.7 minutes after introduction: equivalent to 2.0 cm/sec average maximum transport velocity. However, a maximum number of marked particles in both size classes was found in a sample taken 42.3 minutes after introduction. Only one particle in each of the two larger size classes was recovered. Particle-recovery distribution is assumed to be influenced by sample size and total weight of particles in each size class containing marked particles. Converted particle-recovery distribution is based on weight ratio of marked particles to total particles in each appropriate size class. The data indicate an inverse size-velocity relationship prevails in beach drift transport. (SinhaOEIS)

BEACH CYCLES RELATED TO TIDE AND LOCAL WIND WAVE REGIME,
Scripps Institution of Oceanography, La Jolla, Calif.
D. L. Inman, and J. Filloux.
Journal of Geology, Vol 68, No 2, p 225-231, March 1960. 3 fig, 1 tab, 1 plate, 2 ref.

Descriptors: *Tidal effects, *Sea breezes, *Berms, *Beaches, *Erosion, *Deposition (Sediments), *Waves (Water).
Identifiers: Beach profiles, Wind waves, *Gulf of California.

Along portions of the northwestern coast of the Gulf of California the beaches exhibit a fortnightly cycle of erosion and deposition which is related to the combined effects of the tides and the waves generated by the daily 'sea breeze'. In this area the higher waters of spring tide occur during the early afternoon when the 'sea-breeze' regime is strongest. This coincidence of maximum wave intensity during the times of highest water causes the position of the beach berm to follow the elevation of the envelope of the higher high waters in a fortnightly cycle. A record of the beach cycle is preserved within the beach face by the bands of heavy minerals that are concentrated by wave action at the level of each high water. (Sinha - OEIS)

Descriptors: *Littoral drift, *Coasts, Sand, Ocean waves, *Beaches, *Sedimentation, Surf, Littoral.
Identifiers: Heavy minerals, Near shore processes, Size sorting, *Mineral deposits.

By studying the facies of seacoasts, it was determined that sedimentary rocks provide the main source. The littoral drift of sediments caused by waves represents the general dynamical condition. The waves separate the heavy minerals on beaches, but the conditions of separation often change. The study of recent deposits discloses that they consist, as a rule, of transgressive layers with buried relics of accumulative forms. The latter include fields of heavy minerals. With the redistribution of detritus differentiation of the material by size and weight takes place. The assortment takes place in shallow water at the water's edge where waves are deformed or broken. The so-called surf current runs up the beach and then flows back. The surf current forms the beach layer which represents a combination of a series of transverse layers that slant seaward. The beach layer contains strata of washed-out concentrate of heavy minerals. (Sinha - OEIS)

Identifiers: Nearshore processes, *Presque Isle Peninsula (Penn), Beach stabilization, Artificial beach nourishment.

Presque Isle Peninsula, a sandy spit on the south shore of Lake Erie, has experienced continued erosion of its lakeside shoreline ever since first attempts to stabilize and halt its natural eastward migration. For nearly 150 years numerous structures have been built on the shoreline in attempts to slow down or halt the deterioration and migration of the Peninsula and consequent loss of valuable land. Analysis of the data indicate the test area involving coarse sand fill has undergone minimal material loss and maintained a relatively stable profile. On the basis of this experiment it is judged that definite shore stabilization occurs, with attendant benefits such as substantially reduced nourishment requirements, from the utilization of sand fill that has size characteristics superior to that originally found on an eroding beach. SOIL EROSION--THE UNMENTIONED POLLUTER,
Illinois State Water Survey, Urbana.
W. H. Walker.
Pollution Engineering, Vol 4, No 2, p 56-57, March-April, 1972. 1 fig.

Descriptors: *Soil erosion, *Erosion control, Check structures, Vegetation establishment, *Water pollution control, Soil conservation.
Identifiers: *Soil erosion standards, Zero tillage, *Suspended solids loads.

Soil erosion from rural areas usually remains fairly stable once agricultural land-use practices have been established. This may not be the case in urban areas because of construction. Relatively short-term soil erosion losses from construction sites during land clearing, shaping and stabilization of new surfaces may contribute significant sediment loads (up to 50 to 150 tons per acre) to water sources. Soil erosion standards in the United States generally have been established on the premise that any rate of erosion that does not harm crops or the crop land is permissible. In many states more restrictive standards do already exist but are not rigorously enforced. If these standards were enforced all farming and construction would probably be terminated. Methods of soil conservation to reduce sediment loads in construction and agriculture are discussed. (Campbell-NWWA)

SPECTROPHOTOMETRIC DETERMINATION OF CALCIUM,
Upper Iowa Univ., Fayette.
T. S. Prokopov.
Mikrochimica Acta, No 3, p 429-434, 1973. 3 fig, 2 tab, 5 ref.

Descriptors: *Calcium, *Aqueous solutions, *Colorimetry, Absorption, *Spectrophotometry.
Identifiers: Chemical interference, Sample preparation.

A method was developed for determining calcium by a direct colorimetric method using sodium rhodizonate as a reagent. Standard solutions ranging from 2-200 ppm Ca (II) were prepared using calcium nitrate. The analytical procedure involved placing 1 ml of sample in a test tube, rendering it basic (pH 12) with sodium hydroxide, and adding 3 ml of 25 ppm rhodizonate solution. After shaking, the samples were transferred to cuvets for measurement of absorbance at 570 nm. The procedure is not laborious, eliminates interfering ions, and is convenient to use. (Little-Battelle)

INTERFERENCES IN NICKEL DETERMINATIONS BY ATOMIC ABSORPTION SPECTROMETRY,
California Univ., Los Angeles. Dept. of Chemistry.
L. L. Sundberg.
Analytical Chemistry, Vol 45, No 8, p 1460-1464, July 1973. 4 fig, 2 tab, 21 ref.

Descriptors: *Nickel, *Aqueous solutions, Heavy metals, *Pollutant identification, Water analysis, Absorption.
Identifiers: *Atomic absorption spectrophotometry, *Chemical interference.

This study was undertaken to evaluate interferences from Zn, Fe (III), Cu, Co, Mn (II), and Cr (III) in the atomic absorption spectrometry of nickel. Stock solutions of all but copper were prepared by dissolving the metals in HCl and diluting with water. Copper solutions were prepared by dissolving CuCl2.2H20 in water. Interferences were studied with both oxidizing and reducing air-acetylene flames. Other variables were wavelength and burner elevation. Samples contained transition metal concentrations of 2000 ppm and 20 ppm Ni. The results show that interferences from Fe (III), Cu, Co, Mn (II), and Cr (III) are similar and are greatly influenced by observation height. Consequently, careful adjustment of this parameter can eliminate them. In a reducing flame, the Ni absorbance can be enhanced or depressed by the same concomitant, and the direction of the interferences is further dependent upon the concentration of interfering species. ROLE OF SOLVENT EXTRACTION PARAMETERS IN GOVERNING THE POTENTIAL SELECTIVITY OF LIQUID MEMBRANE ELECTRODES,
Uppsala Univ. (Sweden). Dept. of Analytical Chemistry.
S. Back, and J. Sandblom.
Analytical Chemistry, Vol 45, No 9, p 1680-1684, August 1973. 4 fig, 1 tab, 19 ref.

Descriptors: *Selectivity, *Solvent extractions, *Zeta potential, Hydrogen ion concentration, Acids, Equations, Mathematical studies, Electrical properties, Membranes, *Electrodes.
Identifiers: *Membrane electrodes, Liquid membranes, Extraction coefficients, Organic solvents, Ion selective electrodes.

The relationship between solvent extraction parameters and the potential selectivity of liquid membranes has been examined. An expression for the electrode potential has been derived containing measurable solvent extraction parameters. This expression is used to compare the potential selectivity of a liquid membrane-consisting of tetraalkylammonium salts dissolved in methylene chloride-with the solvent extraction properties of the same system. The potential selectivity constant is related to the extraction constant by a square root dependence which is interpreted in terms of surface diffusion phenomena. The pH-dependence of the electrode potential in the presence of weak acids as well as the role of solvent is also examined. It is concluded that extraction processes determine the potential selectivity of liquid membranes if the extraction constants are sufficiently large and if the solvent favors the counter ions. ENVIRONMENTAL ANALYSIS PROBLEMS CREATED BY UNEXPECTED VOLATILE BERYLLIUM COMPOUNDS IN VARIOUS SAMPLES,
Aerospace Research Labs., Wright-Patterson AFB, Ohio.
M. S. Black, and R. E. Sievers.
Analytical Chemistry, Vol 45, No 9, p 1773-1775, August 1973. 3 tab, 7 ref.

Descriptors: *Beryllium, *Gas chromatography, *Air pollution, Public health, Digestion.
Identifiers: Sample preparation, Chemical recovery, *Orchard leaves, *Volatilization, Recovery, Biological samples, Wet digestion, Accuracy, Beryllium compounds, Ashing, Electron capture gas chromatography, GC-mass spectrometry.

Analysis of orchard leaves samples for beryllium yielded inconsistent results when the samples were prepared by different methods suggesting that volatile beryllium contents may have been present. To investigate this possibility, samples of orchard leaves and air were obtained. The orchard leaves were prepared for analysis by wet digestion in an open container, by wet digestion in a flask with a reflux condenser, and by low temperature ashing in an oxygen plasma. Air samples, which were provided by EPA's Office of Air Programs, have been collected in a sampling train consisting of an EPA sampling probe, two Millipore AA filters backed by Whatman filters in series, two water impingers in series, a dry impingers to catch water condensation, and a cold trap. Samples from each section were analyzed. All analyses were by electron capture gas chromatography. These results were compared with those obtained by GC-mass spectrometry. The results of this study indicate the existence of naturally occurring volatile beryllium compounds. The various digestion and ashing procedures of orchard leaves have shown that beryllium is lost in the vapor phase at relatively low temperatures (less than 200 C). This suggests that a considerable amount (at least 90 percent) of the beryllium in the orchard leaves may be organically bound and that it is lost upon destruction of the organic matrix unless precautions are taken. Analyses of the impinger samples show that beryllium content was much higher in the cold traps than in the water impingers in spite of the fact that the cold traps came last in the flow train. This supports the contention that volatile beryllium compounds do exist and that they are present in the vapor state in facilities where beryllium is machined. (Little-Battelle)

Descriptors: *Water analysis, *Chemical analysis, *Chelation, *Gas chromatography, Chromium, Beryllium, Lead, Flame photometry.
Identifiers: Atomic absorption spectrophotometry, *Metal chelates.

The use of volatile metal chelates for the determination of trace quantities of metals by gas chromatography and electron capture or mass spectrometer detection provides detectability limits as low as 0.01 micrograms per liter for chromium and beryllium. Two chelating agents, 2,2,6,6-tetramethyl-3, 5-heptanedione (piv) and trifluoracetylacetone (tfa) were tested with copper, chromium, nickel, iron, lead and aluminum. Reaction procedures tried were (1) direct aqueous extraction from buffered and unbuffered systems, (2) extraction from heated solutions, (3) extraction from an acid-methanol solution, and (4) sealed tube reactions with both aqueous solutions and crystal forms. Descriptors: *Grants, *Oceanography, *Water pollution control, Water resources development, Environment, Water chemistry.
Identifiers: Sea grants.

The National Sea Grant Program has adopted a program in chemistry as a result of national interest in environmental degradation. Normally, the Sea Grant Program reacts to, and awards grants to Universities in, the general area of pollution control where the project is itself related to another aspect of marine resource development. Sea Grant encompasses pollution programs ranging from estimates of trace metals in estuarine organisms and sediments, to studies of roles of benthic organisms as elements of ecological warning systems, studies of quality of water in bays and estuaries, and estimates of phosphate concentrations in industrial waste waters. The effects of chemical concentration, nutrients, and salinity generally are investigated. (Knapp-USGS)

Descriptors: *Geochemistry, *Organic acids, *Groundwater, *Exploration, *Oil, Oil fields, Oil wells, Natural gas, Phenols, Volatitily, Boiling, Hydrolysis, Water types, Geologic time.
Identifiers: USSR, *Volga Region, Esters.

Genetic water types ranging from low-salinity sodium bicarbonate, sodium sulfate, and magnesium chloride waters to calcium chloride brines were investigated for distribution of simplest organic acids in groundwater of the Lower Volga Region. Butyric, acetic, and formic acids were found in all waters, while propionic acid was lacking in most samples. Total concentration of volatile acids in groundwater circulating in non-oilbearing structures ranges from 0.40 to 5.0 mg/liter. Concentration of simplest organic acids in calcium chloride waters and brines of productive structures ranges from 0.65 to 45.25 mg/liter. There is a definite correlation between concentration of acids and type of hydrocarbon deposit, and a relation is established between phenol and volatile-acid concentrations in the waters. Descriptors: *Geophysics, *Sea water, *Surfaces, *Rain water, *Salts, Carbonates, Sulfates, Chlorine, Evaporation, Equations
Identifiers: USSR

Rainwater collected over the sea contains all the principal salts found in seawater. Average chlorine ratios for Na and Mg in rainwater over the sea are almost identical to those in the surface film of the sea. Good agreement is also observed in the case of boron. Average chlorine ratios for Ca, K, and SO4 in rainwater are, in some instances, higher than those calculated for the surface film. Average chlorine ratios for carbonates in rainwater are much higher than calculated CO3/Cl ratios in the surface film. The chlorine ratio of surface-active components of seawater is, in the first approximation, independent of their physical and chemical properties and depends mainly on their concentration in seawater. Average chlorine ratios in rainwater collected over the sea are related to the ratios at the sea surface. Deviations from this reflect fractionation of salts from the sea in the atmosphere, depending on meteorological, geographisal, and other conditions. (Josefson-USGS)

WATER IN BIOLOGICAL SYSTEMS, VOL 3.

Consultants Bureau: New York, N.Y.; London, England. M. F. Vuks, A. I. Sidorova, editors. 1971. 82 p, Illus.
Identifiers: *Biological systems, Books, Organisms, Rats, *Water properties, Water chemistry, Biochemistry.

This book consists of selected papers presented at the continuing seminar on the structure and role of water in living organisms at the Physics Institute of Leningrad State University. The first section contains papers on the following topics: hydrophobic bonding in dilute aqueous nonelectrolyte solutions; resolution into components of the profiles of IR absorption bands; the structure of water; and coordination-number fluctuations in water. The next section includes papers on the following aspects of water in biological systems: use of graph-theory methods to describe the structure of water; self-diffusion constants of water in protein solutions and latex suspensions; state of water in molecular complexes of hexamethylene tetraamine with inorganic-salt crystal hydrates; and investigation of tissue water metabolism in white rats by IR spectrometry. The final section includes papers on the following: state of water in dispersed materials; optical constants of liquid water; and mechanism of water-structure ordering in solutions of nonpolar molecules. Numerous tables and graphs are included, and each paper ends with a list of literature cited.--Copyright 1973, Biological Abstracts, Inc.

MONROES: A TYPE OF SO-CALLED MUD VOLCANOES IN TIDAL FLATS,
Centre de Recherches Forestiere des Laurentides, Quebec.
J-C. Dionne.
Journal of Sedimentary Petrology, Vol 43, No 3, p 848-856, September 1973. 6 fig, 1 tab, 58 ref.

Descriptors: *Sedimentary structures, Mud, *Mud flats, *Ice, Intertidal areas, Ice breakup, Rivers, Ice loads.
Identifiers: *Mud volcanoes, Monroes, *St Lawrence estuary.

Small mud mounds occur in tidal flats of the St. Lawrence Estuary, Quebec, Canada. They are observed during break-up at Montmagny, 65 km NE of Quebec City, and at a few other localities. They occur generally in groups, and occasionally in isolation in relatively soft mud, have a rounded conical shape with occasionally a nipple at the top, steep slopes (40 to 65 deg), and are 5 to 25 cm in diameter, and 5 to 20 cm high. They develop under the icefoot as a result of load pressures which expel air and possibly also water trapped under surficial soft mud layer and thin ice laminae during icefoot formation, in late fall. They characterize mud tidal flats of cold regions. (Knapp-USGS)

Available from NTIS, Springfield, Va. 22151 as COM-72-11134 Price $3.00, printed copy; $1.45 microfiche. Texas A and M University Sea Grant Program Report TAMU-SG-72-701, June 1972. 12 p, 4 fig, 1 tab, 3 ref. SG2-35213.

Descriptors: *Shrimp, *Brackish-water fish, *Brine shrimp, *Texas, Fish populations, Growth rates, Ponds, Research and development, Methodology, Ecosystems, Environmental effects, Fish, Biology, Aquatic animals, Marshes.
Identifiers: *White shrimp, Brackish ponds, Fish removal.

The effect of fish removal on growth and condition of juvenile white shrimp was studied in two brackish ponds near West Galveston Bay, Texas. After 77 days, shrimp in the pond in which the fish were removed averaged 12.3 mm longer and 4.0 g heavier than those in the pond with fish and seine samples indicated that shrimp abundance had noticeably declined in the pond with fish. It was concluded that fish not only prey on shrimp, thus reducing their numbers, but also compete with them for supplemental and natural feeds, thus depressing their growth rate. (Woodard-USGS)

THE CIRCULATION OF PRINCE WILLIAM SOUND,
Alaska Univ., College. Inst. of Marine Science.
R. D. Muench.
Available from NTIS, Springfield, Va. 22151 as E73-10291 Price $3.00, printed copy; $1.45 microfiche. ERTS-1 Contract project report to NASA, February 20, 1973. 10 p. NAS5-21833.

Descriptors: *Water circulation, *Gulfs, *Sounds, *Aerial photography, *Alaska, Remote sensing, Satellites (Artificial), Sediment discharge, Currents (Water), Coasts, Estuaries, Data collections, Winds, Tides, Streamflow.
Identifiers: *River sediment plumes, *Prince William Sound region (Alaska).

The feasibility was determined for studying surface circulation in coastal waters using surface visible properties observed from ERTS-1 imagery and surface water circulation in the Prince William Sound region (Alaska). Circulation patterns deduced from oceanographic data are correlated

with features seen on the ERTS imagery. Results suggest that sediment-laden plumes of freshwater from rivers may be useful tracers of surface water motion due to their high visibility. The two usable images obtained to date corroborate that westerly flow was occurring in the Gulf of Alaska just south of Prince William Sound, and that an inflow into Prince William Sound was occurring concurrently with flood tides on both occasions. River plumes are useful tracers, but poor weather conditions somewhat limit the use of satellite imagery. (Woodard-USGS)

Available from NTIS, Springfield, Va. 22151 as COM-73-10065 Price $3.00, printed copy; $1.45 microfiche. South Carolina Office of Marine Conservation, Management and Services Educational Report No 1, March 1972. 19 p, 18 fig, 15 ref.

Descriptors: *Oysters, *Estuaries, *South Carolina, History, Spawning, Growth rates, Productivity, Environmental effects, Tidal effects, Salinity, Sedimentation, Water temperature, Water quality, Water pollution effects, Industrial wastes, Sewage effluents, Commercial shellfish, Economic impact.

Within the borders of South Carolina are approximately 2,2000 miles of saltwater creeks, bays, sounds and rivers. Many of these bottoms support oyster beds. Some 7,059 acres of intertidal oyster grounds are either under private lease or included in Public Recreational Shellfish Grounds. The modern oyster industry had its beginnings in the nineteenth century. Commercial production peaked shortly after the beginning of the twentieth century. Current harvesting problems hold annual production to about 250,000 bushels. However, in terms of dollar value the oyster in South Carolina is the second most valuable seafood product. South Carolina oysters have a wide variety of shapes and sizes. This diversity of configuration depends upon the place the set occurs, subtidal or intertidal, and the growing conditions present at the place of set. The most common type of growth produces groups known as the 'cluster oyster'. These oysters grow in the intertidal zone and are formed by successive yearly sets on the older oysters. Steam canneries prefer the larger clusters which can be more economically harvested and processed. Today, the Ashley River produces no oysters commercially. The Ashley River is and has been for some years heavily polluted with sewage and mill waste. This pollution may have been the cause of the decrease in the size of the oysters of today. (Woodard-USGS)

ESTUARINE AND COASTAL WATER DYNAMICS CONTROLLING SEDIMENT MOVEMENT AND PLUME DEVELOPMENT IN LONG ISLAND SOUND,
Geological Survey, Hartford, Conn.
F. H. Ruggles Jr.
Available from NTIS, Springfield, Va. 22151 as E73-10378; Price $3.00, printed copy; $1.45 microfiche. Progress Report to NASA, Goddard Space Flight Center, February 28, 1973. 1 p.

Descriptors: *Mixing, *Estuaries, *Sounds, *Aerial photography, *New York, Inflow, Saline water-freshwater interfaces, Salinity, Movement, Sediment transport, Streamflow, Remote sensing, Satellites (Artificial), Hydrologic data, Salinity, Chemical stratification, Analytical techniques.
Identifiers: *Long Island Sound (NY), *Connecticut River (Conn), Inflow plumes.

As the Connecticut River flows into Long Island Sound, large plumes develop during the mixing of ocean and estuarine waters. Plumes were delineated for July 28, October 8, October 27, and December 2, 1972, by analyzing ERTS-1 imagery with the SRI Electronic Satellite Image Analysis Console (ESIAC). Because the chemical and physical composition of the plume and ocean water were not too different the ESIAC was utilized to expand the scenes and subject the transparencies to varying combinations of viewing techniques to identify and delineate the plumes. Best results were obtained when band 5 transparencies were used. Indications are, when the scene being analyzed is predominantly in the first two steps of the gray scale, it is best to use the negative transparencies. When the analysis is being done above the first two steps of the gray scale, it is best to use the positive transparencies. (Woodard-USGS)

FORECAST OF THE 1972 PINK SALMON RUNS, SOUTHEASTERN ALASKA,
Alaska Dept. of Fish and Game, Juneau. Div. of Commercial Fisheries.
K. E. Durley, and M. C. Seibel.
Available from NTIS, Springfield, Va. 22151 as COM-72-11432 Price $3.00, printed copy; $1.45 microfiche. Informational Leaflet No 158, July 1972. 39 p, 6 fig, 6 tab, 6 ref.

Descriptors: *Pink Salmon, *Anadromous fish, *Fish migration, *Fish harvest, *Alaska, Forecasting, Analytical techniques, Fish populations, Pacific Ocean, Estuaries, Environmental effects.
Identifiers: *Pink Salmon runs forecasting (Alaska), Fish tagging.

Results of the 1971 preemergent fry sampling indicate a return in 1972 of 13.7 million pink salmon to southern Southeastern Alaska and a return of 12.9 million to northern Southeastern Alaska for a total return of 26.6 million pinks. Although the total magnitude of the run appears relatively strong, the forecast by district and timing segments indicates that returns to certain areas will be very weak. The harvest in southern and northern Southeastern Alaska is expected to be approximately 7.7 million and 8.9 million respectively. Tagging studies have indicated that upon entering the offshore waters of Southeastern Alaska pink salmon separate into two groups, the northern group entering via Icy Strait and the lower Chatham Strait and the southern group entering via Sumner Strait and Dixon Entrance. (Woodard-USGS)
W73-14591

RESTORATION OF ALABAMA'S SUPPLY OF SEED OYSTERS,
Alabama Dept. of Conservation and Natural Resources, Montgomery.
J. H. Crance.
Available from NTIS, Springfield, Va. 22151 as COM-72-11199 Price $3.00, printed copy; $1.45 microfiche. Completion Report to NOAA, National Marine Fisheries Service, August 1969. 2 p.

Descriptors: *Oysters, *Fisheries, Fish populations, *Fish management, *Alabama, Estuaries, Ecosystems, Ecology, Aquiculture, Shellfish, Growth rates, Fish reproduction, Water pollution effects, Mortality.
Identifiers: *Oyster planting, Cedar Point reefs (Alabama).

A shell planting program was begun during 1968 in an effort to restore the supply of seed oysters at Cedar Point reefs in Alabama. A total of 143,127 barrels of shells were planted. Spat set on shells planted in the three areas during 1968 averaged 1.6 spat per shell in Area 3, 4.8 spat per shell in Area 2 and 5.8 spat per shell in Area 1, one month following planting. OCEANOGRAPHY (OKEANOGRAFIYA).
Far Eastern Hydrometeorological Research Inst., Vladivostok (USSR).

Dal,nevostochnyy Nauchno-Issledovatel'skiy Gidrometeorologicheskiy Institut Trudy, No 37. Leningrad, G. G. Chalenko, editor, 1972. 107 p

Descriptors: *Oceanography, *Pacific Ocean, *Subarctic, Sea water, Sea level, Tides, Thermal stratification, Convection, Temperature, Thermal conductivity, Water structure, Dissolved oxygen, Hydrogen ion concentration, Straits, Meteorology, Synoptic analysis, Stations, Forecasting, Measurement, Winter.
Identifiers: USSR, *Soviet Far East, Kurile Islands, Sea of Okhotsk, Heat exchange.

Dynamics and structure of waters in the subarctic zone of the Pacific Ocean were investigated in this collection of 9 papers prepared by the Far Eastern Hydrometeorological Scientific Research Institute in Vladivostok. Studies are made of dissolved oxygen and pH in Kurile Islands straits in winter and of surface-water temperatures and thermal conductivity in the Sea of Okhotsk, and methods are developed for forecasting average monthly air temperature anomalies for December-April for 25 coastal hydrometeorological stations in the Soviet Far East. (Josefson-USGS)

STUDENT PROJECTS ON COASTAL ZONE AND OFFSHORE RESOURCES MANAGEMENT,
Massachusetts Inst. of Tech., Cambridge.
S. Resnick, J. Nichols, R. Chertow, and R. Dwyer.
Available from the National Technical Information Service as COM-73-10262. Report No. MITSG 72-13 and Index No. 72-313-Nd1, June 30, 1972, 146 p, 1 fig, 4 tab, 11 and 8 ref. NOAA Sg 2-35150.

Descriptors: *Coasts, Water resources, *Water pollution effects, *Waste disposal, Natural resources, *Thermal pollution, Economics, Management, *Cost-benefit analysis, *Electric power industry, *Biomass, Outfalls, Massachusetts.
Identifiers: Woods Hole (Mass), Ocean outfall, Electric utilities, Narragansett Bay (R.I.), Species diversity.

Two student projects on coastal zone and offshore resources management are presented. The first, 'Environmental Cost-benefit Analysis, Regulatory Administration, and the Financial Administration of Electric Utilities', represents an effort to apply marginal techniques and a limited knowledge of technology to establish a framework of approach to a complex set of problems which our society faces today. In the second, 'Some Experiments Relating to the Woods Hole Outfall', it was concluded that the observable effects of the outfall appear to be limited to a radius of less than 10 meters about the outfall. Within this radius, there are changes in the summer and fall community, with respect to dominant species diversity and biomass. In the winter, there was almost no significant difference. (Sinha-OEIS)

A REVIEW OF THE CHARACTERISTICS, BEHAVIOR AND DESIGN REQUIREMENTS OF TEXAS GULF COAST TIDAL INLETS,
Texas A and M Univ., College Station. Dept. of Civil Engineering.
E. J. Schmeltz, and R. M. Sorensen.
Avialable from the National Technical Information Service as COM-73-10695. Texas A and M University, Sea Grant Program. Report No C.O.E. 156 and TAMU-SG-73-202, April 1973. 88 p, 21 fig, 4 tab, 65 ref. NOAA-04-3-158-18.

Descriptors: *Coasts, *Inlets (Waterways), Tidal waters, Hydraulics, *Design criteria, Stabiliza-

tion, Fresh water, Littoral drift, *Sediment transport, *Texas.
Identifiers: *Tidal inlets, Tidal waves, Inlet design, Artificial inlets.

Characteristics, behavior and design requirements of Texas Coast tidal inlets are reviewed. The characteristics of natural inlets are summarized under the following heading: inlet formation, shoal areas, offshore bar, spit formation and channel migration, secondary channels, sediment size distribution, regional peculiarities, and selected Texas Inlets. Tidal wave propagation is discussed. Pertinent factors influencing inlet stability and configuration, are littoral drift, wave action, current velocities in inlets, geometry, bottom shear, sediment load, and fresh water input. Inlet hydraulics, stability criteria, artificial stabilization and available design procedures are discussed. Hydraulic equations generally used to describe the flow in a tidal inlet are presented along with an explanation of the simplifying assumptions normally made. (Sinha - OEIS)
W73-14618

A NUMERICAL MODEL OF A FJORD ESTUARY. I. BASIC CONSIDERATIONS AND PROPOSED FINITE DIFFERENCE SCHEMES,
Alaska Univ., College. Inst. of Marine Science.
J. B. Matthews.
Report No. R72-15, October 1972. 71 p, 2 fig, 3 tab, 32 ref, 1 append. ONR-N00014-67-A-0317-0002.

Descriptors: *Estuaries, *Weather forecasting, Circulation, Diffusion, *Fjords, Equations, *Numerical analysis, *Mathematical models, *Alaska.
Identifiers: Coordinate systems, *Finite difference equations, Heat diffusion, Eddy diffusion, Boundary conditions.

Physical and numerical considerations necessary to construct a full oceanographic numerical model of a fjord estuary are set forth. A discussion of a coastal model is included and details of choice of grid and the handling of boundary conditions are given. Consideration of techniques used in numerical weather forecast models is included because some can be applied in coastal models. The grid arrangement, finite difference equations and suggested methods for tackling boundary considerations are given for a three dimensional model with time. It is proposed that a vertical two dimensional model be used as the starting point for a fjord model experiment. It is suggested that this model would give a good approximation of the circulation patterns while having an order of magnitude improvement on computer time over the 3D model. The 2D model should allow the importance of different parameters, such as eddy diffusion of heat and momentum, to be experimented with on a simple model for many cases before the 3D models are attempted. The review of previous modeling work indicates that physical boundaries and the manner in which they are treated are likely to be major new problems to be solved in coastal models. Also proposed is a three dimensional ten layer model and a set of finite difference equations. A simplification to a vertical-longitudinal fjord model is made and the set of equations is included. COPEPOD INDICATORS OF SURFACE WATER MOVEMENTS OFF THE OREGON COAST,
Oregon State Univ., Corvallis. Dept. of Oceanography.
F. A. Cross, and L. F. Small.
Limnology and Oceanography, Vol 12, No 1, p 60-72, January 1967. 6 fig, 1 tab, 25 ref.

Descriptors: *Copepods, *Bioindicators, *Upwelling, Rainfall, Runoff, River flow, Water properties, Coasts, Oregon, *Columbia River, *Currents (Water), Movement, Water circulation.
Identifiers: Davidson current, Acartia danae, Centropages mcmurrichi, Near shore processes, TSP diagrams, River plumes.

Two small copepods, Acartia danae and Centropages mcmurrichi, were used as reciprocal indicators of seasonal surface current changes off the Oregon coast in 1961 and 1962. A. danae was found inshore and offshore in winter, indicating the northward flow (with an onshore component) of the Davidson Current. C. mcmurrichi was found inshore in early summer and farther offshore by late summer, indicating a southerly flow (with an offshore component). In the spring and fall, these species occurred together inshore, indicating a transitional state. Temperature-salinity-plankton (TSP) diagrams were used to examine the relationships between distributions of the copepods and local processes affecting near-surface water properties (upwelling, rainfall and runoff, and the Columbia River plume). These diagrams emphasized that the major effect on copepod distribution was the seasonal shift of surface currents, with rainfall and runoff possibly affecting the inshore distribution of A. danae in winter. Upwelling had no apparent effect on the distribution of either species. Columbia River discharge, which flows southerly in summer, probably overwhelmed the general offshore (westerly) movement of surface currents, and hence the offshore movement of C. mcmurrichi, near the mouth of the river. The effect of the Columbia River plume farther out to sea was not shown conclusively to have an effect on the distribution of either species in summer. (Sinha-OEIS)

FLUME STUDIES OF THE TRANSPORT OF SEDIMENT IN ESTUARIAL SHOALING PROCESSES,
California Univ., Berkeley. Hydraulic Engineering Lab.
R. B. Krone.
Final Report prepared for Army Engineer District, San Franciso, June 1962. 110 p, 35 fig, 3 tab, 23 ref, 2 appen. DA-04-203 CIVENG-59-2.

Descriptors: Estuaries, *Bays, *Sediment transport, Deposition (Sediments), Coastal engineering, Sedimentation, Hydraulics, Flocculation, Viscosity, Particle size, Clay minerals, Shear strength, Flumes.
Identifiers: *San Francisco Bay, *Shoaling processes, Gravity flow, Fluid mud, Bed shear, Bed structure.

The object was to obtain qualitative knowledge of the transport and deposition processes of San Francisco Bay sediments and to relate these processes to properties of the sediment materials and to the flow of the suspending medium. Measurements of deposition and scour from flowing water were made in a hydraulic flume. Some samples required laboratory analyses, others such as measurements of sediment properties were made under bench-top conditions. Studies made were: particle size distribution, clay mineral analysis, non-crystalline components, flocculation, shear strength of flocs, settling and consolidation, viscosoty of sediment suspensions, and deposition from flowing salt water. Applications of laboratory findings to bay sediment transport encompassed study of shoaling processes. The following statements concluded the study. (1) Cohesive sediment is transported long distances in suspension as flocs. (2) Suspended sediment can be deposited only at bed shears less than a critical value; deposition occurs more rapidly at lower shears. (3) The deposition rate is sensitive to the flocculation rate. Flocculation is enhanced by the suspended sediment concentration, by the sizes and size distribution of flocs, and by internal shearing rates. (4) Sediment in the 'fluid mud' state can flow from rapid deposition areas into adjacent areas by gravity. (5) Above a given bed shear, sediment can be resuspended by bed failure or erosion, depending on bed structure. (Sinha-OEIS)

THE TWO-DIMENSIONAL FLOW OSCILLATIONS OF A FLUID IN A SPINDLE-SHAPED BASIN: APPLICATION TO PORT KEMBLA OUTER HARBOUR, N.S.W., AUSTRALIA,
Wollongong Univ. Coll. (Australia). Dept. of Mathamatics.
D. J. Clarke, and N. D. Thomas.
Australian Journal of Marine and Freshwater Research Vol 23, No 1, p 1-9, June 1972. 4 fig, 5 tab, 7 ref.

Descriptors: *Harbors, *Storms, *Mathematical models, *Ocean waves, Resonance, Synthetic hydrology, Flow characteristics.
Identifiers: Long waves, Progressive waves, *Australia coast (N.S.W.).

Port Kembla Outer Harbour has a history of severe ranging during storm activity, and hence a knowledge of its resonant behavior is a necessary requirement towards understanding the cause of the range action. The Harbour has been shown to be suitably approximated by a spindle shape, which is the name given by Hidaka (1931) to a basin whose surface perimeter is defined as the intersection of two confocal parabolae. Hidaka's results are enlarged; more basic harmonics being found. These are then applied to the Outer Harbour which is assumed to be excited by a fully formed clapotis with an antinode at the entrance. The two particular harmonics which are most likely to be excited are found to have the same period of 153 sec. Experimental evidence has given long wave periods in the Harbour as 150 and 160 sec. The resonant mode corresponding to a period of 54 sec is found to have a large amplification factor at the entrance to the Inner Harbour, and this may be compared with model study results where at 56-58 sec the range action is greatest. TIME SENSING AND ANALYSIS OF COASTAL WATERS,
Virginia Inst. of Marine Science, Gloucester Point.
M. Nichols, and M. Kelly.
In: Remote Sensing of the Environmental, Proc of 8th International Symposium held at Willow Run Laboratories, Ann Arbor, Michigan, October 1972. p 969-981, 1972, 10 fig, 9 ref. ONR N00014-72C-0268.

Descriptors: Photography, *Sediment transport, Plankton, *Estuaries, *Remote sensing, *Satellites (Artificial), *Aerial photography, *Coasts.
Identifiers: Tonal patterns, Densitometry.

Sequential photographs from aircraft and satellites provide a source of data for studying dynamic features of coastal waters. Procedures for detecting

features follow several approaches; (1) application of sequential signatures, (2) inferences from hydraulic flow patterns, (3) simple comparative analysis. To quantitatively detect tonal changes, images in two or more frames must have proper registration and comparable tones, i.e. tones free of photographic difference and changes of solar illumination. Tonal difference is removed by normalizing successive time frames. Control points with stable reflectance are selected, their densities are measured in successive frames, differences determined and the resulting linear correction is applied to the density distribution of transient tonal areas of water. Once tones are brought to a common density reference, differences of image density in the same geographic area are determined between frames taken from time to time, areas of equal change are delineated and further related to causal processes or impacts. Normalizing and numerical differencing is best accomplished by employing a digital or computerized microdensitometer and by analyzing one spectral band at a time. Application of the procedures is demonstrated by analyses of tonal patterns representing suspended sediment and plankton in an estuary. (Sinha-OEIS)

TURBIDITY, TRANSPARENCY AND COLOR OF WATER IN THE ESTUARY AREA (MUTNOST', PROZRACHNOST' I TSVET VOD VZMOR'YA),
I. A. Ray, and K. Bondar.
Available from the National Technical Information Service as AD-651-798 , $3.00 in paper copy, $1.45 in microfiche. Naval Oceanographic Office, Washington, D.C. Report No Trans-258, 1967. Trans. from Gidrologiya ust'yevoy Oblasti Dunaya, Chapter 12, p. 326-332, 1963. 13 p, 7 fig, 2 tab.

Descriptors: *Estuaries, *Deltas, Coasts, Shallow water, Optical properties, Wind, Rivers, Sedimentation, *Turbidity, Storms, *Color.
Identifiers: *Danube River, *Transparency, Wind-driven currents, USSR, Romania.

On the basis of observations conducted by various organization of USSR and Rumania the distribution of turbidity, transparency and color of water in the Danube estuary area was determined. It appears that the degree of turbidity depends upon the nearness to the distributaries of the Danube delta, the force and direction of wind, the quantity of discharged water per unit time and the velocity and mass of fluvial currents. The greatest degree of turbidity is observed during the flood period in the Danube (maximum in June). In the coastal portion of the estuary the variation of turbidity is determined not so much by the discharge of the river as by the action of wind-driven currents. Therefore the maximum values of turbidity in shallow areas are observed during strong storms. The numerical values of transparency dependent upon these factors are briefly summarized, compared and charted, so as to present the spatial pattern of the distribution of transparency and color of water, as well as their variations with time and climatic conditions. A CASE STUDY OF LITTORAL DRIFT BASED ON LONG-TERM PATTERNS OF EROSION AND DEPOSITION,
Johns Hopkins Univ., Baltimore, Md. Cheaspeake Bay Inst.
J. R. Schubel, H. H. Carter, E. W. Schiemer, and R. C. Whaley.
Chesapeake Science Vol 13, No 2, p 80-86, June 1972. 8 fig, 3 ref NOAA PL 89-304, Proj AFC-4-1

Descriptors: *Littoral drift, *Coasts, *Sediment transport, Erosion, Sedimentation, Sands, *Estuaries, *Deposition (Sediments), *Chesapeake Bay
Identifiers: Near shore processes, Longshore drift, Sand transport.

A knowledge of the routes and rates of littoral drift is a prerequisite to predicting the probable effects of proposed nearshore structures on the maintenance of a stretch of coast. The prevailing patterns of littoral drift can, at least in some cases, be more reliably established by inference from the long-term patterns of erosion and deposition than through short-term field studies of sediment transport. For an 8-mile stretch of Chesapeake Bay coast, a case study was designed to delimit the long-term patterns of erosion and accretion in order to establish the prevailing littoral drift. The routes of nearshore sediment transport inferred from the sediment budget data indicate that there is a prevailing longshore drift from north of Long Beach to just south of the cape at Flag Ponds where an eddy interrupts the sand movement. The longshore transport is reestablished south of the Flag Ponds and extends to Cove Point. (Sinha - OEIS)

WAVE AGITATION IN BAYS AND HARBORS - METHODS OF MEASUREMENT AND ANALYSIS,
Tokai Univ., Tokyo (Japan). Coll. of Marine Science and Technology.
T. Sakou.
In: Proceedings Tenth Conference on Coastal Engineering, TOKYO, September 1966. Chapter 45, Vol 2, p 97-107, 1966. 5 fig, 9 ref.

Descriptors: *Bays, *Harbors, Coastal engineering, Surges, Coasts, *Waves (Water), Hawaii.
Identifiers: Honolulu, *Wave action, *Near shore processes.

Practical and effective methods for the measurement of and the determination of the type and the mode of wave action in a semi-enclosed basin are investigated. Pressure gages and flow meters are considered as instruments abailable for such measurement. The combination and arrangement of these instruments as well as the use of power spectral and cross spectral analyses as the basic means of data reduction are discussed. Special attention is given to the problem of estimating the contributions from the progressive and from the standing modes of oscillation separately. Significance of such estimation on engineering planning is briefly discussed and examples are given. (Sinha - OEIS)

SHALLOW-WATER WAVES,
Shell Development Co, Houston, Tex. Exploration and Production Research Div.
J. E. Chappelear.
Journal of Geophysical Research Vol 67, No 12, p 4693-4704, November 1962. 4 fig, 1 tab, 11 ref.

Descriptors: *Shallow water, Ocean waves, *Waves (Water), *Coasts.
Identifiers: *Solitary waves, Wave properties.

The physical problem is to calculate the profile and velocity components of a wave, subject to the conditions that the effects of viscosity and surface tension can be neglected. The flow is required to be steady, irrotational, and two dimensional, and the depth of the water is assumed to be small and constant. The shallow-water approximation, first proposed by Friedrichs, is employed, and two additional orders of approximation, beyond the three calculated by Keller, are obtained. The formulas describing the solitary wave are obtained as a special case, and the velocity of the solitary wave so obtained is found to agree almost exactly with the Boussinesq-Rayleigh formula c = the square root of gd (1 + H/d), where c is the wave velocity d is the depth, and H is the wave height. This velocity differs by no more than 2 per cent from the experimental values of Stephan and Dailey. (Sinha - OEIS)
W73-14644

SALT-WATER INTRUSION IN PRINCE EDWARD ISLAND,
Department of Energy, Mines and Resources, Ottawa (Ontario). Inland Waters Branch
P. A. Carr.
Canadian Journal of Earth Sciences Vol 6, No 1, p 63-74, February 1969. 9 fig, 3 tab, 15 ref.

Descriptors: *Estuaries, *Tides, *Saline water intrusion, Aquifers, Density, *Canada diffusion.
Identifiers: *Prince Edward Island.

The numerous saline estuaries situated throughout Prince Edward Island permit high tides to carry salt water a long way inland and to penetrate the bedrock aquifer. Very little groundwater consumption occurs around the banks of the Eliot River estuary, yet salt water has moved into the bedrock to a depth of 185 ft. Beneath this salty water is fresh groundwater, which extends down to about 600 ft where it is underlain by salty water. The salty water in the upper 185 ft of the aquifer is not separated from the fresh groundwater by a confining stratum, but is kept in this position by the higher head of the fresh groundwater. This head maintains a dynamic equilibrium with the heavier salty water. The effect of density in maintaining the position of a fresh and salt water front is not as important as has been previously thought. (Sinha - OEIS)
W73-14645

LATERAL DIFFUSION IN A TIDAL ESTUARY,
Baghdad Univ. (Iraq). Coll. of Engineering.
A. M. Alsaffar.
Journal of Geophysical Research, Vol 71, No 24, p 5837-5841, December 15, 1966. 4 fig, 1 tab, 9 ref.

Descriptors: *Estuaries, Turbulence, Diffusion, Mixing, Waste disposal, Tidal effects, *Energy dissipation, *California, Coasts, Tides, Path of pollutants.
Identifiers: San Francisco Bay, Lateral diffusion, *Tidal estuaries, *San Joaquin River estuary.

Experimental data on the lateral diffusion in a tidal estuary of the San Joaquin River, near San Francisco Bay, were obtained and analyzed. The data were obtained by photographing floating particles. Richardson's 'four-thirds law' is verified by using the neighbor distribution hypothesis. The diffusion coefficient is a function of the mean separation distance and the velocity of flow. The mean separation distance and the variable diffusion coefficient are particularly discussed in relation to the rate of energy dissipation. (Sinha - OEIS)

EDIMENTS OF THE JAMES RIVER ESTUA-Y, VIRGINIA,
'irginia Inst. of Marine Science, Gloucester Point.
I. M. Nichols.
Geological Society of America Memoir 133, p 169-12, 1972. 28 fig, 1 tab, 36 ref.

Descriptors: *Estuaries, *Sediment transport, Bottom sediments, Organic matter, *Deposition Sediments), Sedimentation, *Bathymetry, Partile size, Salinity, *Virginia.
Identifiers: *James River Estuary (Va), Tidal currents, Sea level variations.

The James River estuary of the Chesapeake Bay egion follows the course of a former river valley rowned within the last 9,000 years by the most ecent rise of sea level. The floor is shaped into a entral channel bordered by submerged shoals. Observations show suspended sediment is transported mainly by alternating tidal currents and econdarily by the net nontidal estuarine circulaion. Transport results in a sequence of grain size istributions reflecting the mixing of two textural nd members, clay and sand. Silty clay is eposited in the river and upper estuary, whereas and occurs near the mouth. Transitional types, layey sand and sand-silt-clay, predominate in the niddle estuary. Additionally, biogenic materials, yster shells and fecal pellets, and small amounts f residual components eroded from older leposits are mixed into the sediments by currents, vaves, and organisms. Bottom sediment types ary widely according to local relief, to varying inensity of environmental processes, and to changng rates of supply from different sources. Deposiion is greatest in the middle estuary where salinity anges from 5 to 14 parts per thousand. An elongate zone of relatively high deposition in the lower stuary corresponds to the intersection of the level f no-net-motion with the bottom. Despite subtantial infilling, it is believed the estuary is mainained by the continued rise of sea level and by urrents that flush part of the river-borne load hrough the estuary. (Sinha - OEIS)

OCEANOGRAPHIC SURVEYS OF TRAITORS COVE REVILLAGIGEDO ISLAND, ALASKA,
Bureau of Commercial Fisheries, Washington, D.C.
D. R. McLain.
Special Scientific Report - Fisheries No 576, December 1968. 17 p, 15 fig, 2 tab, 12 ref.

Descriptors: *Estuaries, *Turbulence, *Stratification, *Coasts, *Circulation, Water properties, *Fiords, Estuarine environments, Salinity, Dissolved oxygen, Tidal effects, *Alaska.
Identifiers: *Tidal falls, Reversing tidal falls.

Traitors Cove is a small fiordlike estuary in southeastern Alaska. It is divided into two basins by a narrow constriction, where a reversing tidal falls forms. Four oceanographic surveys of the estuary between 1963 and 1965 showed that this tidal falls creates a region of strong turbulence and destroys the stratification of the water near it. Surface currents in the estuary are predominantly seaward on ebb tide and toward the head of the estuary on flood tide. (Sinha - OEIS)

CIRCULATION, SALINITY AND RIVER DISCHARGE IN THE MERSEY ESTUARY,
Liverpool Univ. (England). Dept. of Oceanography.
K. F. Bowden, and S. H. Sharaf El Din.
Geophysical Journal. Royal Astronomical Society, Vol 10, No 4, p 383-399, Jan. 1966. 7 fig, 8 tab, 6 ref.

Descriptors: *Estuaries, *Mixing, *Salinity, River flow, *Circulation, Tides, Diffusion.
Identifiers: *Mersey Estuary (U.K.), Vertical eddy diffusion, *River discharge.

Observations of currents and salinity in the Narrows of the Mersey estuary have been analyzed in terms of the mixing processes and the dynamics of the flow. At each of 3 stations in a section across the estuary there was a downstream flow in the upper layer and an upstream flow near the bottom, relative to the depth-mean current. Computed values of the coefficient of vertical eddy diffusion, Kz, reached a maximum of 28 sq cm/s at mid-depth at the central station. From observations of salinity in 2 sections at opposite ends of the Narrows, repeated at approximately monthly intervals throughout a year, a high correlation was found between the properties of the salinity distribution and the river discharge into the estuary. While the salinity at the 2 sections decreased with increasing discharge, the horizontal and vertical gradients of salinity both increased. The probable change in the circulation, associated with these salinity changes, is discussed. Variations in the tidal range had a comparatively small effect on the salinity distribution. (Sinha - OEIS)

SALINITY VARIATIONS IN THE CONNECTICUT RIVER,
Geological Survey, Woods Hole, Mass.
R. H. Meade.
Water Resources Research Vol 2, No 3, p 567-579, 1966. 12 fig, 7 ref.

Descriptors: *Estuaries, *Salinity, *Tides, Winds, Rivers, Fresh water, Salt water, *Connecticut river, Mixing, Winds, Chlorides.
Identifiers: *Salt-wedges, River discharge, *Tidal flushing.

Salinity distributions in the lower Connecticut River, measured during the years 1934 through 1939, show the influence of at least three factors: river discharge, tide, and wind. Salinity near the mouth is rather sensitive to changes in upland discharge; discharge events recorded at a gage 101 km upstream are followed a day or two later by markedly equivalent changes in salinity at the mouth. During average or greater-than-average discharge conditions the lower river has the characteristics of a 'salt-wedge' estuary: the water on the bottom of the river may contain 15 parts of chloride per thousand at high tide, whereas the water in the same section of the river at low tide may be almost completely fresh. The effects of winds on salinity are uncertain, but such effects can be either local or related to regional effects of winds on the tides at the river mouth. (Sinha - OEIS)

REFRACTION OF WATER WAVES,
Technische Hogeschool, Delft (Netherlands). Dept. of Civil Engineering.
J. A. Battjes.
Journal of the Waterways and Harbors Division, American Society of Civil Engineers, Vol 94, No WW4, Proceedings paper 6206, p 437-451, November 1968. 3 fig, 15 ref, append.

Descriptors: *Refraction (Water waves), Hydrodynamics, *Ocean waves, *Gravity waves, *Waves (Water), Coasts.
Identifiers: *Gravity surface waves, Wave amplitudes, Wave propagation, Shoaling, Diffraction.

An investigation is presented of the propagation of 3-dimensional, harmonic waves of small amplitude through water of constant depth or gradually varying depth. Within the framework of linear theory for potential flow, the results are exact for propagation over horizontal bottoms, e.g., diffraction, and approximate for propagation over sloping bottoms, e.g., refraction combined with diffraction. An expression is given for the velocity potential of 3-dimensional waves, harmonic in time. The velocity potential must fulfill the classical hydrodynamical conditions. An analysis of the resulting relationships shows that the magnitudes of phase speed and energy flux are affected by amplitude variations. The time-averaged energy flux is directed along wave rays, regardless of amplitude gradients along the wave crests. The expressions for phase speed and energy flux do not involve wave rays; they provide the basis of a computational scheme in which the wave characteristics are com puted in grid points which have a predetermined location. The method may be an alternative for existing methods which utilize wave rays. (Sinha - OEIS)

SOME ASPECTS OF THE OCEANOGRAPHY OF LITTLE PORT WALTER ESTUARY, BARANOF ISLAND, ALASKA,
Michigan Univ., Ann Arbor. Great Lakes Research Div.
C. F. Powers.
Fishery Bulletin, (U. S. Fish and Wildlife Service), Vol 63, No 1, p 143-164, 1963. 27 fig, 3 tab, 10 ref.

Descriptors: *Estuaries, Fish management, Salmon, *Circulation, *Salinity, *Temperature, Optical properties, Estuarine environment, Dissolved oxygen, Estuarine fisheries, *Alaska, *Oceanography.
Identifiers: Flushing, *Little Port Walter (Alas), Oncorhynchus gorbuscha.

Oceanographic studies made in the spring and summer of 1959 in the estuary of Little Port Walter, Alaska are reported. These were made as part of a series of investigations on the biology of pink salmon, Oncorhynchus gorbuscha. Information is given on the distribution of salinity, temperature, transparency, and dissolved oxygen; circulation and flushing of the estuary and the relation of these factors to the discharge of Sashin Creek; and total water transport into and out of the estuary. The methods of studying these processes and parameters are explained. A bathymetric chart of the estuary and meteorological data are included. (Sinha-OEIS)

03. WATER SUPPLY AUGMENTATION AND CONSERVATION

3A. Saline Water Conversion

APPLICATION OF FLUIDIZED BED FOR CONTROLLING THE CONCENTRATION POLARIZATION BOUNDARY LAYER IN REVERSE OSMOSIS DESALINATION SYSTEMS,
National Instrument Labs., Inc., Fredericksburg, Va.
H. Lolachi.
Available from the National Technical Information Service as PB-219 136, $1.45 in microfiche. Office of Saline Water Research and Development Progress Report No 843, March 1973. 57 p, 8 tab, 22 fig, 8 ref. OSW Contract 14-30-2909.

Descriptors: *Desalination, *Reverse osmosis, *Boundary layers, *Permeability, Reynolds number, Cellulose, *Membranes.
Identifiers: Salt rejection, Fluidized bed, Glass microbeads, Surface fouling, Water flux, Tubular reverse osmosis, *Polarization, Cellulose acetate.

The following results have been achieved towards concentration polarization and fouling reduction control. Fluidized beds were compatible with reverse osmosis membranes and did not damage the active membrane surface. Application of a fluidized bed diminishes the concentration polarization to such extent that at low Reynolds number, i.e. 50 to 250, potable water better in quality than some systems operating with turbulent flow was obtained. High water receoveries were obtained, for example, from a 5 ft. long tube with 3/4 in. outer diameter, 30 to 50 per cent product water recoveries were obtained at pressures ranging between 600 to 1500 psi. (OSW)

THE EFFECTS OF POROUS AND SOLID FILLERS ON THE PERMEABILITY OF CELLULOSE ACETATE MEMBRANES,
Cornell Univ., Ithaca, N.Y. School of Chemical Engineering.
P. Harriott, J. Wu, and F. Klunker.
Available from the National Technical Information Service as PB-221 315, $1.45 in microfiche. Office of Saline Water Research and Development Progress Report No. 846, April 1973. 28 p, 21 fig, 2 tab, 15 ref. OSW Contract 14-01-0001-2155.

Descriptors: *Desalination, *Reverse osmosis, Cellulose, Silica, Gels, Sands, *Thermal conductivity, *Membranes, Porous media, Permeability, Diffusivity, Moisture content.
Identifiers: Salt permeability, Salt diffusivity, Compaction resistance, *Fillers, Water flux, Distribution coefficients, Cellulose acetate.

Several types of filled cellulose acetate membranes were prepared to determine the effect of filler properties and polymer properties on permeability of the composite materials. Casting procedures were chosen to give a dense cellulose acetate phase and a uniform distribution of filler throughout the membrane. The composite membranes were evaluated in a reverse osmosis cell and in extraction or desorption tests at ambient conditions. Salt and water permeabilities were measured on filled and unfilled membranes of varying acetyl content. (OSW)

PREPARATION OF HOLLOW FIBERS AND THE EVALUATION OF THEIR PROPERTIES,
Akron Univ., Ohio. Inst. of Polymer Science.
E. A. Meinecke, D. V. Mehta, and S. Crume.
Available from the National Technical Information Service as PB-219 395, $1.45 in microfiche. Office of Saline Water Research and Development Progress Report No. 845, March 1973. 213 p, 102 fig, 14 tab, 63 ref. OSW Contract 14-01-0001-1456.

Descriptors: *Desalination, Membranes, Cellulose, *Membrane processes, *Permeability, Mechanical properties, Creep, Stress.
Identifiers: *Hollow fibers, Salt rejection, Water flux, Fiber failure mechanisms, Cellulose acetate, Melt extruder, Birefringence.

A small melt extruder was designed and constructed for the production of low flux hollow fibers from Eastern E-400-25 cellulose acetate. The screw driven extruder, equipped with special stretching and take up mechanisms, was used to produce fibers having diameters ranging from .003 to .05 inches, with a variable wall thickness to diameter ratio. Hollow fiber bundles were prepared by casting fiber ends in epoxy blocks for insertion into high pressure test cells. Hollow fibers were also produced by solution extrusion. However, solvent evaporation difficulties limited the wall thickness/diameter ratio to values too small to withstand the high pressures encountered in reverse osmosis processes. Desalination characteristics of unstretched and stretched membranes were studied as a function of membrane thickness. Fick's law of transport was applicable not only to the flux characteristics of unstretched membranes, as expected, but also to those of stretched membranes. The applicability of time-temperature superposition to the ultimate elongation of cellulose acetate was also established in these studies. Model studies were also made to determine the influence of fiber geometry to the various mechanisms of fiber failure. (OSW)

RESEARCH AND DEVELOPMENT OF COMPOSITE MEMBRANE TECHNOLOGY,
Gulf Environmental Systems Co., San Diego, Calif.
R. L. Riley, C. E. Milstead, W. J. Wrasidlo, R. L. Grabowsky, and G. R. Hightower.
Available from the National Technical Information Service as PB-220 218, $1.45 in microfiche. Office of Saline Water Research and Development Progress Report No. 851, May 1973. 188 p, 32 fig, 57 tab. OSW contract 14-30-3016.

Descriptors: *Desalination, *Membranes, *Reverse osmosis, Semipermeable membranes, Permselective Membranes, *Permeability, Thin films, Sea water, Saline water, Salinity, Ocean water, Potable water, Polymers
Identifiers: *Composite membranes, Ultra-thin films, Barrier materials, Polyelectrolyte membrane systems, Ultrafiltration membranes, Block polymers, Thin-film composites

Recent advances in the continuing development of the composite membrane have made it possible to produce potable water from seawater in a single stage system at water recoveries in excess of 50%. Stable long-term water fluxes of 25 gal/ft2 day and sodium chloride rejections of greater than 99.5% have been attained with seawater at an applied pressure of 1500 psi, water fluxes at 15 gal/ft2-day have been attained at 1000 psi applied pressure with greater than 99% sodium chloride rejection. Large-scale continuous production of composite membrane has been attained on the prototype casting machine. This achievement, combined with the excellent seawater performance of composite spiral-wound modules, demonstrates a significant advance toward the practical application of the thin film composite membrane. Block copolymers and terpolymers of completely and permanently charged cationic and anionic sequences containing various block combinations have been prepared by block polymerization of 2-vinyl-pyridine (2VP), trimethylsilylemethacrylate (TSM) and styrene (St) monomers, followed by complete quaternization of 2VP sequences, complete hydrolysis of the TSM sequence, and dehydrohalogenation. Desalination studies of dynamically formed membranes of these block copolymers are reported. The results obtained using matrix polymerization as a preparative method have shown that polyelectrolyte complex membranes are effective in the separation of low molecular weight polymeric substrates in ultrafiltration. vailable from the National Technical Informa-
ion Service as PB-220 219, $1.45 in microfiche. Office of Saline Water Research and Development Progress Report No. 847, April 1973. 119 p, 21 fig, 8 tab. OSW contract 14-30-2609.

Descriptors: *Reverse Osmosis, *Membranes, Semipermeable membranes, *Desalination, Separation techniques, Saline water, Membrane processes, Permselective membranes.
Identifiers: *Composite membranes, *Ultrathin membranes, Spiral wound module, Compaction, Wet-dry stability, Polyacrylic polysulfone membranes.

Four principal areas of research and development were investigated. The primary effort was directed toward an investigation of the cause of aging of the cellulose nitrate-cellulose acetate (CN-CA) support and possible solutions for the effect of this aging on the physical and transport properties of the thin-film composite membrane. The second area of investigation involved the development of the composite membrane spiral-wound module. The wet-dry stability of the composite membrane modules was studied in an effort to develop a module capable of undergoing repeated wet and dry cycles without a loss in water flux or an increase in salt permeability. Cross-linking of the porous support prior to application of the thin film was also examined in an effort to reduce the flux decline after pressurization and subsequent drying at elevated temperatures. The third area of research dealt with the long-term behavior of asymmetric CA membranes, including a rheological analysis of the effect of annealing and compaction on water transport and an evaluation of the effect of pressure acting to compress the intermediate layers of the membrane. The fourth area of research consisted of further characterization of composite polyacrylic acid-polysulfone (PAA-PS) membrane performance in mixed salt systems, as well as with various inorganic and organic solutes. HUMIDIFICATION-DEHUMIDIFICATION PROCESS (SOLAR DISTILLATION),
Yugoslav Academy of Sciences and Arts, Dubrovnik. Inst. for Marine Corrosion and Desalination.
H. Ivekovic, S. Lendic, and S. Lasic.
Available from National Technical Information Service as PB-219 256, $1.45 in microfiche. Office of Saline Water Research and Development Progress Report No. 841, March 1973. 28 p, 16 tab, 7 fig. OSW contract 14-01-0001-1427.

Descriptors: *Desalination, Solar stills, *Solar distillation, *Distillation, *Evaporators, Humidity, Saline water.
Identifiers: *Dehumidification.

An evaporator was constructed in which warm saline water flowed downward in the capillaries of hydrophilic gauze sheets. Countercurrent to the saline water flow, warm air flowed along the evaporator through spaces between the gauze sheets thereby saturating it with water vapor. The influence of the flow rate and temperature of both the saline water and air on the amount of water obtained was studied. Eighty experiments were carried out. The highest production of distilled water was obtained with a warm saline water flow rate of 11.7 l/h and a temperature of 75C, when combined with air flow rate of 16 m3/h at 110C. (OSW)

ANTITRANSPIRANTS: A POSSIBLE ALTERNATIVE TO THE ERADICATION OF SALTCEDAR THICKETS,
Arizona Univ., Tucson. Dept. of Watershed Management.
R. S. Cunningham, and D. B. Thorud.
In: Proceedings, 16th Annual Water Conference, Las Cruces, New Mexico Water Resources Research Institute, March 25-26, 1971. p 101-109, 2 fig, 1 tab, 14 ref. OWRR A-018-ARIZ (4). 14-31-0001-3203.

Descriptors: *Phreatophytes, *Transpiration control, Soil-water-plant relationships, Water conservation.

Controversy concerning the eradication of saltcedar for water salvage and flood control indicates that a management alternative may be desirable. The application of antitranspirants to saltcedar may provide such an alternative. The antitranspirants 8-HQS (0.01M) and MDSA (350 ppm) were sprayed on the foliage of potted saltcedar in a greenhouse at Tucson. The transpiration rates were 29 to 47% below control for 5 to 13 days after single applications, and following a retreatment, 27 to 35% less than control for an additonal 15 to 31 days. Consequently, plants receiving two treatments transpired less than control for a minimum of three weeks. These are considered important treatment effects. Conceivably, rainfall could diminish treatment effectiveness. Simulated rain was sprayed on plants in the greenhouse on the first, second or fourth day after treatment with antitranspirants. These studies were inconclusive. Generally, rain did not change the magnitude of transpiration reduction following treatment with antitranspirants. Likewise, rain did not cause important changes in the duration of transpiration reduction in two tests. In another test, however, plants receiving rain transpired less than control for three days, while plants receiving no rain transpired less than control for 15 to 31 days. A rain-no rain difference of this magnitude could be important in an operational treatment program. The growth, color and form of plants treated with one and two applications of 8-HQS and MDSA were not noticeably different from control during or after the experiments. (See also W73-14224)

SNOW AMOUNT IN RELATION TO STREAMFLOW AND HERBAGE PRODUCTION IN WESTERN COLORADO,
Forest Service (USDA), Fort Collins, Colo. Rocky Mountain Forest and Range Experiment Station.
E. C. Frank.
Journal of Range Management, Vol 26, No 1, p 32-34. Jan. 1973. 3 fig, 1 tab, 3 ref.

Descriptors: *Snowpacks, *Streamflow, *Vegetation effects, *Productivity, *Cloud seeding, Grasses, Grazing, *Colorado, Precipitation (Atmospheric), Snow cover, Runoff, Snow surveys.
Identifiers: Black Mesa Experimental Range (Colo).

Black Mesa Experimental Range, located west of Gunnison, Colorado, was used to determine the influence of augmenting the mountain snowpack by cloud seeding. Data were analyzed statistically to define quantitatively the relationship of peak snowpack to hydrologic characteristics and herbage production. Results indicated that increasing the snow precipitation input by 10 percent would lengthen the duration of snow cover less than 2 days; therefore it would have little, if any, im-

mediate effect on the productivity and use of grasslands. (BahrenArizona)

Commonwealth Scientific and Industrial Research Organization, St. Lucia (Australia). Cunningham Lab.
C. T. Gates.
Australian Journal of Botany, Vol 20, No 3, p 261-272, Dec. 1972. 6 fig, 4 tab, 20 ref.

Descriptors: *Moisture stress, *Transpiration, *Leaves, *Australia, Saline soils, Saline water, Wilting.
Identifiers: *Acacia, *Saltbush.

Described are water relations in response to salinity of the legume Acacia harpophylla (brigalow) and of chenopod Atriplex nummularia (old man saltbush), as well as the response of the latter to associated water stress caused by climatic-geographic locations. Both species tolerated salinities up to and beyond sea water concentration under high insolation stress. The effects of leaf area and leaf number for the two species were different, but both benefited from high salinity in the conservation of their water supply with water content of their tissues being higher, especially that of the laminae. Both showed a reduction in the transpiration per unit of leaf area. A. nummularia plants subjected to water shortage in saline substrates had higher lamina water levels, along with a lesser degree of tissue injury both during wilting and upon recovery. Potassium increased tissue hydration more than sodium in A. harpophylla. (Bahre-Arizona)

THE EFFECT OF GRADUAL LEACHING ON THE GROWTH AND YIELD OF SUGAR CANE IN SALINE SOILS,
M. H. El-Gibaly, and M. Goumah.
United Arab Republic Journal of Soil Science, Vol 11, No 1, p 27-37. 1971. 8 fig, 10 ref.

Descriptors: *Sugarcane, *Saline soils, *Irrigation effects, Crop response, *Leaching, Salinity, *Crop production.
Identifiers: *United Arab Republic.

Sugarcane is the main crop of the southernmost part of the UAR, where aridity and salinity are manifest in many areas. Observations were made on the tolerance of sugarcane when planted in soils of different salt levels and nature. Irrigation every other 10 days dilutes the soil solution and lessens the concentration of salts around the buds and plant roots. A drum culture technique experiment was used to study the effect of integrated leaching on growth and yield of 2 main varieties of sugarcane: CO.310 and CO.413. Tap water was used for irrigation during growth, with the amount of irrigation water slightly above water saturation percentage of the soil to allow relatively little salt leaching from the root zone. This permitted a gradual slow improvement of salinity. Results show that both varieties can grow successfully in saline soil of 0.14 percent salinity providing the gradual leaching of salts. A yield of about 50 to 60 percent and 30-40 percent of the non-saline condition can be obtained from both varieties if the initial soil salinity is 1 percent. CO.413 is more tolerant to initial shocks of salinity than CO.310. Slight salinity increases the sucrose percentage in sugarcane. (Bahre-Arizona)
W73-14473

EFFECT OF SODIUM CHLORIDE SALINITY ON THE WATER BALANCE OF ATRIPLEX HALIMUS,
Hebrew Univ., Jerusalem (Israel). Dept. of Botany.
A. Kaplan, and J. Gale.
Australian Journal of Biological Sciences, Vol 25, No 5, p 895-903, Oct. 1972. 5 fig, 3 tab, 20 ref.

Descriptors: *Water balance, *Salinity, *Sodium chloride, Salt tolerance, Plant physiology, Transpiration, Water loss, Leaves, Turgidity, Hydraulic conductivity, Transpiration control, Halophytes, Evaporation, Photosynthesis, Plant growth, *Australia.
Identifiers: *Saltbush.

Sodium chloride was found to improve the water balance of A. halimus plants under conditions of high evaporative demand. Plants grown in salinized culture solutions improved, with higher values of turgor pressure and percentage saturation value compared with plants grown in the control solutions. A constant water potential gradient was maintained between culture solution and the leaf of plants grown in saline culture solutions whose osmotic potential did not exceed -5 bars. Hydraulic conductivity of the root system appeared to have been impaired by salinity. Improved water balance of plants exposed to salinity could be ascribed to a reduction of transpiration. Improving plant water balance by reducing water loss from leaves so as to only slightly reduce photosynthesis per unit leaf area can be accomplished by increasing leaf turgor which leads in turn to a larger leaf area. The mesophyll resistance factor to the measured transpiration-photosynthesis ratio is discussed. (Bahre-Arizona)

SKETCH REGIONAL WATER AND SEWER PLAN.
Neuse River Regional Planning and Development Council, New Bern, N.C.

Available from the National Technical Information Service as PB-214 015; $10.00 in paper copy, $1.45 in microfiche. June 1972. 157 p, 20 maps. NCP-146 NM-7.

Descriptors: *Planning, *Water supply, *Sewerage, Coordination, Financing, Regional development, Urbanization, Water demands, *North Carolina, Census, *Regional analysis.
Identifiers: Utility systems extension, *Neuse River (NC).

Basically a planning prospectus for water supply and wastewater disposal systems in the nine county Region P in eastern North Carolina, this report gives a general description of the region including population and economic analyses, outlines the basic water resources needs, presents a county-by-county inventory of existing and proposed water and sewer systems, and offers general recommendations for future planning. The focus of many of the recommendations is on a 'regional planning concept' in which several small systems would be consolidated or interconnected and county authorities would be created to coordinate water and sewer system planning and implementation. On the other hand, since much of the region is quite rural, recommendations also include the use of Farmer's Home Administration grants for small water supply systems and use of better practices in controlling and locating septic tanks. Municipal and county authority for financing and constructing water and sewer facilities is discussed. (Elfers-North Carolina)

STUDY DESIGN FOR A REGIONAL SEWER AND WATER PLAN.
Cuyahoga County Regional Planning Commission, Cleveland, Ohio.

August 1971. 35 p, 2 fig. HUD Ohio P-258-20.

Descriptors: *Planning, Coordination, Water distribution (Applied), Waste water disposal, Storm drains, *Ohio, *Regional analysis, Social participation, Water supply.
Identifiers: *Citizen participation, Capital improvements program, Utility extension, *Cuyahoga County (Ohio), Advisory committees.

The role of the Cuyahoga County Regional Planning Commission in developing plans for water distribution and waste water collection is outlined. Emphasis is on the relationship of Commission activities to those of several other agencies responsible for utility construction and planning. Goals and objectives for the County, sewerage planning, water supply planning, and storm drainage planning are discussed. Key sections of the report are those covering the implementation of the plans, including a capital improvements program, the integration of plans from several agencies, and citizen participation in the planning process, particularly via advisory committees and public meetings. Preliminary estimates for staging and cost breakdown and a tentative time schedule are provided. (Elfers-North Carolina)

REALITIES OF URBAN WATER RESOURCES OPERATING PERSPECTIVE,
Washington Suburban Sanitary Commission, Hyattsville, Md.
R. J. McLeod.
Paper presented at American Society of Civil Engineers, Annual Water Resources Meeting, Washington, D.C., January 29-Feb. 2, 1973. 8 p.

Descriptors: Water resources development, *Water supply development, *Water policy, *Water distribution (Applied), Water delivery, Water management (Applied), Planning, Forecasting, Water allocation (Policy), *Political aspects.

Many of the problems of water supply utilities are the result of political planning and policy decisions. In carrying out the political decisions, problems arise, and the complaints of the public are directed toward the utility, not the politicians. One problem is that planning and policy processes are not totally accurate. Planning for an expected growth of a given population with a certain distribution may prove to be inadequate, causing either shortages, or an excess capacity. With the change in selected officials can come changes in the goals of local government and, hence, a change in policy for the utility to follow. Another problem

can be the lack of cooperation of different levels of government. While some water resource projects may require only local support, other projects may require regional, state, or federal cooperation. Slow action on the part of a governmental unit can bring many problems to the local utility. Lack of financial support can cause further problems. Money is sometimes promised, but not supplied. Wastewater treatment facilities suffer similar problems. Additional problems exist in knowing what levels of water quality will be required in the future, and how municipal wastewater treatment will fit in with other forms of pollution--such as erosion, urban runoff, and agricultural runoff. (Poertner)

WATER RESOURCES IN SANTA CLARA COUNTY: A PLAN FOR CONSERVATION,
M. Johnson.
Prepared for Santa Clara County Association of Resource Conservation Districts and South Santa Clara Valley Water Conservation District, 1973. 59 p, 9 fig, 13 tab, 53 ref.

Descriptors: *Water management, *Conservation, Coordination, Water resources development, Administration, Water supply, Sewerage, Water quality, Recreation, Urbanization, *Planning, *California.
Identifiers: *Santa Clara County (Calif), Countywide planning, Public participation.

Santa Clara County is an area of 1300 square miles, 60% of which is in hills and mountains, containing 1.1 million people and the fourth largest city in California. Since water resources management is a total system approach, the county should take the initiative in providing integrated, countywide water resources development and conservation. Such integrated management is seen to include (1) water supply, distribution, and use, (2) sewage collection, treatment, and disposal, (3) storm and flood waters, (4) water storage, including groundwater storage, (5) water quality, (6) the reclamation and reuse of wastewater, (7) relationships to other planning sectors such as land use, health and safety, recreation, and open space, and (8) institutions and intergovernmental relations. Each of these topics is discussed with the emphasis often on agencies involved, planning interrelationships, public attitudes and goals, or socioeconomic aspects. A very detailed outline is presented of proposed goals and policies for management of water resources in the county. Policies include such topics as future growth, consolidation of governmental authority, wetlands, water supply sources, water quality, and public participation. (Elfers-North Carolina)
W73-14675

RIVERFRONT DEVELOPMENT PLAN, CONNECTICUT RIVER, SPRINGFIELD, MASSACHUSETTS.
Springfield Planning Dept., Mass.

January, 1973. 16 p, 6 fig, append.

Descriptors: *Recreation, *Connecticut River, *Massachusetts, *Planning, Parks, Aesthetics, Urban renewal, Water quality, Environmental effects, Land use, Access routes.
Identifiers: *Waterfront planning, Esplanade, *Springfield (Mass).

The City of Springfield has historically depended on the Connecticut River for transportation and commerce, but at present much of the urban waterfront is either unused or deteriorating. However, with the new interest in water quality and environmental quality there is a great opportunity to make the river a significant asset to the metropolitan area again. Intended to establish a general framework for planning and development of the waterfront, this study consists of basic goals and policies and more specific proposals for development in six different waterfront areas. The goals include the achievement of a 'B' water quality classification for the entire stretch of the river within the metropolitan area, the improvement of public access to the waterfront, the acquisition and provision of recreation facilities all along the waterfront, and the enhancement of the scenic quality of the waterfront. One key concept to achieve these goals is the proposal of an esplanade, or a broad walkway, to follow the river and connect various public and recreational areas. Each of six planning areas are described in more detail, outlining specific recreation projects and land use locations. (Elfers-North Carolina)
W73-14676

RIVERBANKS IMPROVEMENT PROGRAM, (BROOME AND TIOGA COUNTIES, N.Y.).
Broome County Planning Dept., Binghamton, N.Y.; and Southern Tier East Regional Planning Board, Binghamton, N.Y.

February, 1972. 20 p, 6 fig, 3 append.

Descriptors: *Planning, *Recreation, *Flood plains, *Parks, Environmental effects, Water quality, Rivers, Urbanization, Coordination, *New York.
Identifiers: *Riverbanks, Open spaces, Susquehanna River, *Binghamton (N.Y.).

A summary is presented of the Riverbanks Program being carried out by the counties of Broome and Tioga covering approximately 120 miles of riverbank areas. The main river involved is the Susquehanna but four other streams, the Chenango, Delaware, Otselic, and Tioughnioga, also flow through the two-county region. The riverbanks and valleys are significant recreational and aesthetic resources in the region and are threatened by rapid urbanization, especially in the Binghamton metropolitan area. Problems include loss of open space, development on floodplains, deteriorating water quality, and changing groundwater levels. The Riverbanks Program is based on abundant data including Army Corps of Engineers reports, state and federal funding, and strong local support. Some of the policies included in the Program are: (1) key feature of the regional open space plan should be water and riverbank recreation; (2) the county governments should take the lead in developing the recreation potential; (3) large areas of riverbanks should be placed in public ownership; (4) land use standards and controls should be adopted for floodway areas; and (5) ecological balance of riverbank areas should be considered. In the first action under the Program, Broome County designated an acquisiton zone along the Susquehanna River and began purchasing land. (Elfers-North Carolina)

HOWARD COUNTY, INDIANA: COMPREHENSIVE WATER AND SEWER PLAN.
Hamilton (Ernest R.) Associates, Inc., Indianapolis, Ind.

Prepared for Howard County Plan Commission, Kokomo, Indiana, April, 1970. 71 p, 13 fig, 30 tab.

Descriptors: *Planning, *Water supply, *Sewerage, Soil types, Septic tanks, Urbanization, Regulation, *Indiana.
Identifiers: *Howard County (Ind.), Data inventories, Comprehensive development plan, Subdivision regulations.

This study was sponsored by the Farmers Home Administration and covers all of Howard County except the city of Kokomo. The report is divided into two parts: the first is a presentation of data and maps on the natural resources of the county, its population, economy, land use, community facilities, and utilities; the second part outlines a general planning strategy for providing water and sewer facilities to the county. The two key factors on which the study was based are the significant urbanization taking place in the county and the ability of various soils to support private septic tanks and wells. It is recommended that the county adopt subdivision regulations dealing with septic tanks and surface drainage, that the areas of Russiaville, West Middleton, and Greentown begin to develop public water and sewer systems, and that a comprehensive development plan be formulated to help guide urbanization in the rest of the county away from poor soils. THE URBAN RIVER: A STAFF PROPOSAL FOR WATERFRONT DEVELOPMENT IN THE DISTRICT OF COLUMBIA.
National Capital Planning Commission, Washington, D.C.

For sale by the Superintendent of Documents, U. S. Government Printing Office, Washington, D.C. 20402 - Price $2.50. December 1972. 49 p, 29 fig, photos, 2 append.

Descriptors: *Land use, *Aesthetics, *Recreation, *City planning, Planning, Scenery, Parks, Landscaping, Rivers, Potomac River, Anacostia River, *District of Columbia.
Identifiers: *Waterfront planning.

Although there has been a growing concern for problems of water quality, sedimentation, and flooding of our rivers there has been much less interest in the quality of urban riverfront areas. Focusing on the waterfront areas of the Potomac and Anacostia Rivers within the District of Columbia, this study includes an analysis of historical development and present conditions in the waterfront areas and suggests numerous general policies and specific objectives for the development and redevelopment of these areas. Some of the policies include the preservation of the historical character of much of the waterfront, the encouragement of a variety of land uses, the increasing use of open areas outside the District of Columbia for recreation, and an effort to make the rivers and riverfronts more accessible to city residents and visitors. Detailed studies of specific waterfront areas are proposed and it is recommended that the Georgetown and Anacostia waterfronts be acted on first. The impact of the improvement policies on specific features of the waterfront such as Buzzard Point, National Airport, George Washington

Memorial Parkway, Rock Creek, and Key Bridge is discussed. (Elfers-North Carolina)

STRESS METABOLISM. II: CHANGES IN PROLINE CONCENTRATION IN EXCISED PLANT TISSUES,
Waite Agricultural Research Inst., Glen Osmond (Australia). Dept. of Plant Physiology.
T. N. Singh, D. Aspinall, L. G. Paleg, and S. F. Boggess.
Australian Journal of Biological Sciences, Vol 26, No 1, p 57-63, Feb 1973. 4 fig, 12 ref.

Descriptors: *Amino acids, *Metabolism, *Moisture stress, *Barley, *Plant tissues, Plant growth regulators, Stress analysis, Water supply, Biochemistry, Plant physiology, Plant growth, Planting management, Hydrolosis.

This paper, second in a series on stress metabolism, explores the capacity of the various barley plant organs to accumulate free proline when isolated from the rest of the plant and subjected to a water stress under aerobic conditions. Shoot apices and excised root systems, and sections of the lamina and leaf sheath of the first leaf of 10-day barley plants were incubated on aerated polyethylene glycol solution or distilled water. The imino acid proline accumulated rapidly in the leaf lamina sections subjected to osmotic stress and less rapidly, after a delay of 16 hours, in those floated on water. Leaf sheath sections apices showed on increase in free proline content on either medium. Albino leaf sections accumulated no proline when floated on water or in the solution unless supplied with precursors for proline biosnythesis. Green tissue, however, accumulated a high concentration of proline on the solution alone. Neither chlorophyll nor functional chloroplasts are essential, therefore, for proline accumulation during water stress. (See W73-14004, W73-14504 and W73-14505) (Bahre-Arizona)
W73-14503

STRESS METABOLISM. IV: THE INFLUENCE OF (2-CHLOROETHYL) TRIMETHYLAMMONIUM CHLORIDE AND GIBBERELLIC ACID ON THE GROWTH AND PROLINE ACCUMULATION OF WHEAT PLANTS DURING WATER STRESS,
Waite Agricultural Research Inst., Glen Osmond (Australia). Dept. of Plant Physiology.
T. N. Singh, D. Aspinall, and L. G. Paleg.
Australian Journal of Biological Sciences, Vol 26, No 1, p 77-86, Feb 1973. 4 fig, 2 tab, 22 ref.

Descriptors: *Amino acids, *Metabolism, *Moisture stress, *Wheat, *Plant growth substances, Osmotic pressure, Varieties, Hydrolysis, Proteins, Agricultural chemicals, Growth rates.

Rate and extent of proline accumulation under comparable water stress conditions varies, the potential appearing to vary directly with the ability of the genotype to yield under drought conditions in the field, and to recover after severe osmotically-induced stress. Wheat plants (cv. Gabo) were grown in nutrient solution, with results indicating that neither CCC nor GA3 influenced leaf water potential, which fell rapidly following exposure to elevated osmotic pressure in the rooting medium. CCC reduced plant dry weight, apex elongation, and shoot elongation, but had no effect on primordium formation on the apex. Water stress inhibited growth at the apex and shoot elongation; but these effects were undiminished by previous growth-retardant treatment. GA3, however, promoted both growth attributes even where growth had been completely inhibited previously by water stress and leaf water potential was falling rapidly. Free proline accumulation was promoted by previous CCC application in all plant organs, when subjected to water stress, but a reduction relieved accumulated proline as did application of GA3. Neither CCC nor GA3 varied the concentration of free proline in leaves of plants not subjected to water stress. (See also W73-14503) (Bahre-Arizona)
W73-14505

STRESS METABOLISM. III: VARIATIONS IN RESPONSE TO WATER DEFICIT IN THE BARLEY PLANT,
Waite Agricultural Research Inst., Glen Osmond (Australia). Dept. of Plant Physiology.
T. N. Singh, L. G. Palag, and D. Aspinall.
Australian Journal of Biological Sciences, Vol 26, No 1, p 65-76, Feb 1973. 5 fig, 5 tab, 29 ref.

Descriptors: *Amino acids, *Metabolism, *Moisture stress, *Barley, *Chlorophyll, Leaves, Plant growth regulators, Soil-water-plant relationships, Hydrolysis, Growth rate, Environmental control.

Barley plants (cv. Prior) grown in a controlled environment were subjected to 1, 2, or 3 cycles of water stress interspersed with periods of adequate supply. Stress-induced fall in leaf water potential was unaffected by previous drought history. After each deficit period, leaf water potential recovered rapidly to the level of plants not stressed. Chlorophyll content declined during stress, but recovered between stress periods. Previous exposure to stress lowered this decline. In contrast, free proline increased during stress and declined in the intervals. Here, previous exposure to stress increased the potential for proline accumulation in tissue. Responses of 14 different barley varieties to water stress were assessed. There were substantial varietal differences in proline accumulation related to leaf survival during stress and plant growth rate following stress. Varieties accumulating larger concentrations tended to have leaves

that survived extreme water stress more readily and grew more rapidly following stress relief. (See also W73-14503) (Bahre-Arizona)

EFFECT OF TEMPERATURE AND HUMIDITY STRESS DURING FLOWERING ON SAFFLOWER (CARTHAMUS TINCTORIOUS L.),
Agricultural Research Service, Tucson, Ariz. Plant Science Research Div.
L. H. Zimmerman.
Crop Sci. Vol 12, No 5, p 637-640. 1972.
Identifiers: Carthamus-tinctorius, Flowering, Genotype, *Humidity, *Safflower, Stress, *Temperature.

Sensitivity of safflower during flowering to temperature and humidity stress and genetic variation for such sensitivity has been in question. Cultivars were grown in the greenhouse under similar conditions except for a 24-hr period during anthesis when they were exposed to temperature and humidity differentials in controlled environment chambers. Plants were exposed to these differentials on the day the second sequentially developing head began blooming, thus enabling measurement of sensitivity to temperature and humidity stress during pre-, post-, and anthesis stages of head development. Heads in anthesis and pre-anthesis were the most sensitive to temperature and humidity stresses. Cultivars responded differently to the stresses for seed number, weight, and yield. Results of the experiment suggest that screening safflower genotypes for tolerance to temperature and humidity stress using controlled environment chambers is practical and 24-hr exposure during anthesis is sufficient to differentiate genotypes.--Copyright 1973, Biological Abstracts, Inc.

WHAT INVESTIGATIONS ARE REQUIRED TO OBTAIN INTENSIVE AND HEAVY-YIELD VARIETIES OF WINTER WHEAT,
Polish Academy of Sciences, Warsaw. Inst. on Agricultural and Forestry Economics.
T. Ruebenbauer.
Postepy Nauk Roln. Vol 18, No 4, p 5-14. 1971. Illus.
Identifiers: Breeding, *Drought resistance, *Wheat varieties, *Crop yield, Winter-hardiness.

Short-strawed varieties of wheat are susceptible to drought and lack winterhardiness. They should be bred for a greater water potential. Attempts should be made to break the correlation between short-strawed varieties and nonresistance to drought. Winterhardiness of short-strawed varieties needs to be improved. With 5 genes conditioning this trait, it is possible to produce hybrids excelling the parts.--Copyright 1973, Biological Abstracts, Inc

K. Kasiviswanathan, M. N. Sitarama Iyengar, and S. Krishnaswami.
Indian J Seric, Vol 10, No 1, p 90-95, 1971.
Identifiers: Density, Dry farming, *India, Moisture, *Mulberry leaf, *Mulch, Mysore, *Soil temperature, Weed, Yield.

In Mysore, India, where more than 4/5 of the mulberry area is grown under scanty rainfall conditions as a dry crop, leaf production is meager in Dec.-April due to inadequate soil moisture. The plastic cover was efficient in retaining moisture. Mulberry production increased by as much as 43% and leaf quality improved.--Copyright 1973, Biological Abstracts, Inc.

04. WATER QUANTITY MANAGEMENT AND CONTROL

4A. Control of Water on the Surface

PROCEEDINGS - SIXTEENTH ANNUAL WATER CONFERENCE.
New Mexico State Univ., University Park. Water Resources Research Inst.

Available from the National Technical Information Service as PB-223 379, $5.25 in paper copy, $1.45 in microfiche. Proceedings held at Las Cruces, New Mexico, March 25-26, 1971, 197 p. OWRR A-999-NMEX (6).

Descriptors: *Water resource development, Engineering, *Planning, *Management, *Water law, Sewage disposal, *Irrigation, Systems analysis, Sediment, Herbicides, Corn, New Mexico, Texas, Arizona, Antitranspirants, Tamarisk.
Identifiers: Cochiti Dam, Navajos, Rio Grande.

Water is the most limiting resource in New Mexico and the water that we have is the State's greatest asset. Surface and subsurface water is used to supply growing municipal and industrial demands and to irrigate the land. According to the Senate Select Committee Report of 1961 and the Water Resources Council Report of 1968, a major part of the State is facing the most critical shortage of water in relation to projected demands of any other area of the Nation. In addition to papers discussing New Mexico's specific water problems, other papers dealt with renovating sewage effluent, systems analysis in water resource management, irrigation of corn, Arizona's water problems, antitranspirants, sediment, herbicides, irrigation, consumptive requirements, water and the Navajos, and water law.

FLOOD PLAIN INFORMATION, CLARKSVILLE, TENNESSEE.
Army Engineer District, Nashville, Tenn.

Prepared for the City of Clarksville, Tenn. 1964. 26 p, 12 plates, 4 tab, 11 ref, glossary.

Descriptors: *Flood control, *Flood data, Flood plains, Flood damage, Flood protection, Urbanization, *Tennessee.
Identifiers: *Flood plain management, Cumberland River, Clarksville (Tenn), Army Corps of Engineers, Red River (Tenn).

Flood losses in Clarksville from the Cumberland River and the Red River have been relatively small in the past. This is largely due to the existence of three Corps of Engineers reservoirs in the headwaters of the Rivers and the few number of residences located in the flood plain areas of the City. As urban growth and renewal continues, strong pressures are emerging to build on the flood plain. Past floods in the area and areas of potential flood hazard are described. There are numerous maps, cross section diagrams, and charts illustrating past flooding problems and photographs indicating levels of potential floods in relation to existing development. Non-structural flood control measures such as existing flood protection measures including flood warning and emergency evacuation plans and guidelines for reducing future flood damages with emphasis on flood plain management are briefly discussed. Recommendation is made for careful study to determine the relative economy of restricting and, in some cases prohibiting, construction which would be subject to flooding. Other considerations must also be studied before objective flood plain management can be initiated to balance the economic and aesthetic needs of a community with the natural demands of two active rivers. A GENERAL SPATIAL MODEL: I. APPLICATION OF EFFICIENT LAND USE,
Ministry of Works, Wellington (New Zealand). Water and Soil Div.
B. St Clair-Corcoran.
J Hydrol (Dunedin), Vol 10, No 2, p 127-132, 1971.
Identifiers: *Land use, Model studies, *Spatial models, *Negentropy.

A new energy form is postulated from which a general model is synthesized. This general model uses the idea of hydrological efficiency constants to consider the question of efficient land use practice. The negentropy of water (the empirical measure of the efficiency of distribution of the usable energy of water) is referred to as a hydrological efficiency constant, and it is noted that the negentropy of water is a sensitive indicator of the stability of a given society in real terms.--Copyright 1973, Biological Abstracts, Inc.

A MATHEMATICAL MODEL OF WATER ADVANCE AND FLOW IN SMALL EARTH CHANNELS,
Washington State Univ., Pullman. Dept. of Agricultural Engineering.
D. L. Bassett, and D. K. McCool.
Available from the National Technical Information Service as PB-223 433, $2.75 in paper copy, $1.45 in microfiche. Project Completion Report, July 12, 1973. 22 p, 2 fig, 6 ref. OWRR A-053-WASH (1). 14-31-0001-3848.

Descriptors: *Mathematical models, *Furrow irrigation, *Computer programs, *Open channel flow, Flow, Equations, Boundaries (Surfaces).

The objective was the development of a mathematical model of unsteady, spatially varied open channel flow in small earth channels. Furrow irrigation, a notable example of such flow, was used to illustrate the development. During this first year the mathematical basis of the model was prepared. This involved the complete partial differential equations of continuity and momentum written for small earth channels where infiltration into the channel bed depletes the flowing stream. Since the equations cannot be solved in closed form a procedure was prepared for obtaining approximate solutions by numerical methods. This procedure uses the method of characteristics on a fixed rectangular grid. Description was prepared for the five sets of boundary conditions that can occur in furrow irrigation. A preliminary description of water movement into the channel bed and walls was developed. These and other provisions have been assembled into a model and associated digital computer program which describes the complete furrow irrigation process. Provision is included to describe the disposal of water within and from the channel that will result from given flow conditions. The model is operational and is now being tested and revised as needed.

THEORY OF A RECTANGULAR GRAVEL ENVELOPE IN DRAINAGE DESIGN,
Iowa State Univ., Ames. Dept. of Agronomy.
D. Kirkham, and M. S. Selim.
Soil Science Society of America Proceedings, Vol 37, No 4, p 517-521, July-August 1973. 5 fig, 5 tab, 8 ref. NSF Grant GK-31137.

Descriptors: *Subsurface drains, *Subsurface drainage, Soil water movement, Equations.
Identifiers: Gravel-packed drain tubes.

A theory was developed to determine the radius of a circular drain which is equivalent to a square drain. A square drain is encountered in practice when a gravel envelope of square cross section is placed around a subsurface circular drain. The resistance of the gravel to flow was neglected. The square drain tube was analyzed for two cases: (1) when an impermeable barrier was at great depth below the square drain tube center, and (2) when the bottom edge of the square drain tube lay on a plane impermeable barrier. In both cases it was assumed that the length of the edge of the square drain tube was small compared with the distance from the drain's center to a water table over the drain, and that the drain ran full. For case 1 an equivalent circular drain tube of radius 1.1772 times the half-width of the square drain tube may be used to replace the square drain tubes. If the square drains lie on the impervious layer, as in case 2, the radius of the equivalent circular drain is 1.1037. (Knapp-USGS)

SOME FACTORS INFLUENCING TOLERANCE TO MOISTURE STRESS OF THREE RANGE GRASSES,
Idaho Univ., Moscow. Forest, Wildlife and Range Experiment Station.
E. F. Schlatterer, and M. Hironaka.
Journal of Range Management, Vol 25, No 5, p 364-367, Sept. 1972. 3 tab, 5 ref.

Descriptors: *Moisture stress, *Range grasses, *Drought tolerance, *Soil-water-plant relationships, Seeds, Planting management, Nutrients, Plant growth, Temperature control, Growth rates, Nitrogen.

Pre-conditioning of bluebunch wheatgrass, squirreltail, and Thurber stipa plants by exposure to different temperatures and watering schedules, as well as soil types, affected their tolerance to moisture stress. Vigor of seedlings in mound soil was greater than for intermound soil during the first 11 weeks as suggested by plant height and weight. This was attributed to higher nutrient availability, particularly nitrogen. Reversal in growth response occurred during the 5-week moisture stress period. Plants on less fertile intermound soil produced more regrowth than those on mound soil. Conditioning of plants to stress eas affected by soil. Within limits, growing conditions less than optimum tend to produce plants able to tolerate greater moisture stress. Pre-conditioning of plants to resist or withstand moisture stress should be considered where availability of moisture is a major concern. (Bahre-Arizona)

FLOOD CONTROL REPORT, CASA GRANDE, ARIZONA, 1973.
Henningson, Durham and Richardson, Inc., Phoenix, Ariz.

June 25, 1973. 47 p, 5 tab, 10 plates. HUD-701. CPA-AZ-09-16-1008.

Descriptors: *Flood control, *Drainage engineering, *Lateral conveyance structures, *Urban drainage, *Project planning, *Arizona, Arid climates, Design flood, Surface runoff, Flood routing, Cost analysis.
Identifiers: *Casa Grande (Ariz).

Situated in the south-central portion of Arizona in the Sonoran Desert, the city of Casa Grande lies at an elevation of 1500 feet with a slope down to approximately 1200, and is drained by many arroyos and washes, with alluvial fill characterizing the surrounding areas. The climate is typical of the arid desert region, with high summer temperatures, and both winter and summer precipitation, the latter tending to be of high intensity. In attempting a flood control plan, it was necessary to consider the surrounding terrain, and to try to predict the nature of planned community development. Since much of the growth of the City is expected to take place in exactly those areas subject to serious flooding without proper planning, drainage design criteria were paramount in the recommendations. A 50-year storm frequency was selected as a base for the master plan consisting primarily of a combination of roadways, roadways with center channels, open channels, and retention lakes. Because of excessive costs involved, only limited use of underground drainage was projected. A grade ordinance plat was developed for the entire study areas to pemit housing construction at elevations above flood levels. The entire plan is projected for implementation in 4 phases at a total cost of fifteen million dollars, and details of work to be undertaken in each are given in a series of plates. (Paylore-Arizona)
W73-14476

WESTERN WHEATGRASS GERMINATION AS RELATED TO TEMPERATURE, LIGHT, AND MOISTURE STRESS,
Forest Service (USDA), Albuquerque, N. Mex. Rocky Mountain Forest and Range Experiment Station.
O. D. Knipe.
Journal of Range Management, Vol 26, No 1, p 68-69, January 1973. 1 fig, 1 tab, 1 ref.

Descriptors: *Wheatgrasses, *Light, *Temperature, *Germination, *Moisture stress, Soil stabilization, Rhizomes, Seeds, *New Mexico, Plant growth, Semiarid climates, Alkaline soils.
Identifiers: *Rio Puerco watershed (N Mex).

Western wheatgrass (Agropyron smithii Rydb.) was chosen for study to determine whether it could aid in soil stabilization in the badly depleted Rio Puerco watershed of west central New Mexico. Its qualities that make it suitable are that it is a rhizomatous long-lived perennial with high soil-stabilizing potential, it is adapted to alkaline soils, and its seedlings are vigorous and develop rapidly. Germination of western wheatgrass was best when seeds were held for 16 hr at temperatures between 55 and 75 degrees Fahrenheit, and 8 hr at temperatures between 75 and 90 degrees F daily. Germination was independent of light, but was severely reduced by moisture stresses above 1.0 atm. The detrimental effect of moisture stress was increasingly severe with increasing temperature above optimum. (Bahre-Arizona)

CHEMICAL COMPOSITION OF SIX SOUTHERN GREAT PLAINS GRASSES AS RELATED TO SEASON AND PRECIPITATION,
Texas Tech Univ., Lubbock. Dept. of Range and Wildlife Management.
E. E. Willard, and J. L. Schuster.
Journal of Range Management, Vol 26, No 1, p 37-38, Jan. 1973. 1 fig, 5 ref.

Descriptors: *Range grasses, *Chemical properties, *Seasonal, *Great Plains, *Precipitation (Atmospheric), Proteins, Ethers, Evaporation, Environmental effects, Plant growth substances, Moisture availability, Semiarid climates, Southwest U S, *Texas.
Identifiers: *Llano Estacado (Tex).

Grass samples collected from the Llano Estacado of Texas were analyzed to ascertain whether erratic rainfall affects the percentage of chemical fractions. The climate is typified by dry winters and by spring and late summer rainfall. High winds and high temperatures during the growing season result in high evaporation rates which reduce moisture available to plants. Seasonal influences caused variations in crude protein, ether extract, ash, crude fiber, and water. Nitrogen-free extract did not show a seasonal trend. Crude protein, crude fiber, and water content were directly influenced by the rainfall pattern during the growing season, but rainfall did not appear to significantly affect the other chemical components. (Bahre-Arizona)

OBION AND FORKED DEER RIVERS AND TRIBUTARIES, TENNESSEE AND KENTUCKY, INTERIM REPORT: HARRIS FORK CREEK.
Army Engineer District, Memphis, Tenn.

June, 1971. 38 p, 4 plates, 7 tab, photos, 6 append.

Descriptors: *Flood control, *Cost-benefit analysis, *Channel improvement, Flood protection, *Tennessee, *Kentucky, Flood plains, Flood damage, Cost-benefit ratio.
Identifiers: *Flood plain management, Harris Fork Creek (Tenn.), South Fulton Branch (Tenn.), Fulton (Tenn.), South Fulton (Tenn.), Obion River (Tenn.), Forked Deer River (Tenn.).

The District Engineer recommends that the West Tennessee Tributaries Project adopted by the Flood Control Act of 30 June 1948 be modified to include a project for flood control along Harris Fork Creek and its tributary, South Fulton Branch, at an estimated Federal cost of $2,813,000, to consist of channel pavement and enlargement. The study describes the authority under which investigations were made, prior reports completed, the natural characteristics of the study area, the area's flooding characteristics and problems, and existing flood control improvements of the Corps and other federal and nonfederal agencies. Based on this, alternative improvement plans are formulated with cost estimates and an economic analysis of each, noting benefits from flood damages prevented, increased utilization of lands, advanced bridge replacement, use of local unemployed labor, and others, to provide an estimate of average annual benefits. The selected plan is analyzed in greater depth in cost-benefit terms. Extensive appendices give technical data. (Edwards-North Carolina)

Agricultural Research Service, Burlington, Vt. Water Conservation Research Div.
J. Bornstein, and C. L. Fife.
Journal of Soil and Water Conservation, Vol 18, No 2, p 76-79, 1973. 2 fig, 5 tab, 4 ref.

Descriptors: *Drainage practices, *Investment, *Return (Monetary), *Alfalfa, Diversion, Subsurface drainage, Vermont, Crop production, Forages, Installation costs, United States, Canada.
Identifiers: Cabot silt loam.

Effective drainage is an essential factor in the profitability of farming in the northeastern United States and eastern Canada. Alfalfa survival, hay yield, and composition data for seven years of record were employed to indicate response to three surface-subsurface drain treatments of four plots each. The plots were on Cabot silt loam which is a poorly drained, sloping fragipan soil. Although hay yields were not dramatically affected by drainage differences, alfalfa yields increased significantly as drainage intensity increased. Most dramatic was the effect of improved drainage on winterkill. Alfalfa survived severe winterkill conditions at rates of 31, 15, and 3% on subsurface drain spacings of 100- and 200-feet and no subdrains, respectively. Considering only yields and alfalfa quality the 200-foot subsurface system was more profitable. However, the 100-foot subdrain resulted in a much higher alfalfa survival during the 1966 winterkill. Thus, cost savings associated with reseeding should be compared with higher installation cost of the 100-foot subdrain and future prices predicted in order to determine the optimal long-term investment. ORIGINS AND ECOLOGY OF THE SIERRAN ALPINE FLORA AND VEGETATION,
New Hampshire Univ., Durham. Dept. of Botany.
Brian F. Chabot, and W. D. Billings.
Ecol. Monogr. 42 (2): 163-199. Illus. 1972.
Identifiers: *Alpine flora, Artemisia-Tridentata, *California, Chloroplasts, Ecology, Ephedra-Nevadensis, Light, Moisture, Pinus-spp., Reproduction, Respiration, Seasons, Sierran, Soils, Starch, Temperature, Tetradymia-Spinosa, Translocation, *Vegetation.

The primary study area was a transect from the desert near Bishop, California, (1400 m), to Piute Pass in the Sierra Nevada (3540 m). Upward along the transect the vegetational gradient is Ephedra nevadensis-Tetradymia spinosa desert shrub, Pinus monophylla-Artemisiatridentata open woodland, Pinus jeffreyi open forest, Pinus murrayana forest, Pinus albicaulis-sub-alpine herbaceous vegetation, and scattered alpine communities. Only 19% of the alpine species at Piute Pass occur in the Arctic, whereas 38% are held in common with the Rocky Mountains. Species endemic to the Sierra (17%) are in general predominantly from the Californian or Great Basin floras of lower elevations. A number of species have populations in the desert and also at high elevations near the alpine zone. Most of the alpine flora consists of perennials, but several annual species are also present. Annuals are rare in other arctic and alpine floras. Strong vegetation patterning occurs along drainageways from snowbanks or perrenial streams. Solar, sky, and net radiation at 1 m above the soil are greater for alpine than for desert areas. Air and plant-tissue temperatures near the surface of the alpine soil are higher than those in most other alpine areas. Germination of seeds from alpine plants occurred maximally between 20 and 30C. The low winter temperatures of the alpine zone appear to operate as an exogenous dormancy control. Temperatures of the upper photosynthetic compensation point and maximum net photosynthesis are lower in plants of alpine species. Acclimation of dark respiration appear related to changes in the rate of mitochondrial oxidation. Translocation of starch from chloroplasts at low temperatures was impaired in a desert species, but was maintained in a alpine species. There is no indication that any single process, or adaptation to temperature alone, is responsible for the evolution and success of an alpine species. Efficient utiliza-

tion of a short, cold growing season may be the most important selective characteristic in the origin of an alpine flora.--Copyright 1973, Biological Abstracts, Inc.

REPORT OF THE RIVER MASTER OF THE DELAWARE RIVER FOR THE PERIOD DECEMBER 1, 1971-NOVEMBER 30, 1972,
Geological Survey, Washington, D.C.
J. V. B. Wells, and R. E. Fish.
June 1973. 82 p, 3 fig, 1 plate, 19 tab.

Descriptors: *Delaware River, *Hydrologic data, *Hydrologic budget, *Streamflow, *Water quality, Precipitation (Atmospheric), Runoff, Water yield, Floods, Reservoirs, Estuaries, Chemical analysis, Basic data collections, Hydrology, Water supply, Flow rates, Water temperature, Water utilization, Watershed management, Reservoir operation.

The River Master daily operation records were prepared by the Milford office of the Delaware River Master from basic data collected principally on a day-to-day basis by several agencies. The 1972 report year, December 1, 1971 to November 30, 1972, was a year of excessive precipitation and much above average runoff in the Delaware River basin. Severe floods associated with Tropical Storm Agnes occurred in the lower portion of the basin during June. The annual flow of Delaware River at Montague adjusted for change in reservoir storage and diversions was about 60% above median and the highest for the period of record beginning 1940. Pepacton, Cannonsville, and Neversink Reservoirs of the city of New York spilled during the spring and early summer. Diversions and releases from the reservoirs of the city of New York were made within the terms of the Amended Decree. Diversions by New Jersey through the Delaware and Raritan Canal were within prescribed limits of the Amended Decree. Precipitation on the basin above Montague for the 1972 report year was excessive, totaling 52.06 inches, which was the second highest for a report year in the period of record beginning December, 1940. Identifiers: Ice breakup, *Zhdanov Port (USSR), *Ice forecasting, Ice thickness.

The hydrological regime in the northwestern part of Tanganrogskiy zaliv, where the Zhdanov Port with its channel system is located, is discussed from the point of view of navigation. Therefore the wind, waves, and ice phenomena in the area are analyzed, taking into consideration systematic observations carried out by hydrological and hydrometeorological stations in the area from 1945 to 1954, as well as by special expeditions organized in the area during the mentioned decade. On the basis of observation data special equations are composed, with the aid of which it is possible to calculate and forecast the average length of the navigational period, and the dates of various ice phases such as the first appearance of ice, freeze-up, breakup, and disappearance of ice, including variations in ice thickness, by months and by years. Also the occurrence of severe and mild winters and the effects of weather conditions in the region, as well as the peculiar coastal contours in the Zhdanov Port area and the influence of river discharges are analyzed in detail. OPTIMAL POLICY FOR RESERVOIR MANAGEMENT,
McGill Univ., Montreal (Quebec).
M. A. Muspratt.
Nordic Hydrology, Vol 4, No 2, p 57-76, 1973. 5 fig, 15 ref, 2 append.

Descriptors: *Reservoir operation, *Management, *Optimization, *Profit, Stochastic processes, Algorithms, Constraints, Economics, Water supply, Hydrologic cycle, Water users, Reservoir releases, Water loss, Seepage, Evaporation, Damsites, Mathematical models, Systems analysis, *Optimum development plans.
Identifiers: *Nonlinear programming, *Stochastic optimization.

The development of a rational management philosophy for existing reservoirs is being stimulated by the rapid exploitation throughout the world of dam sites which are economically and ecologically viable. A nonlinear, stochastic mathematical programming algorithm is used to maximize profit from the operation of a hypothetical reservoir over a finite time period. The problem is to manage the water released from the reservoir for domestic, industrial, irrigation, and low-flow augmentation uses so as to maximize the profit over the given period of time. Water may also be used for power generation, and losses are experienced due to seepage and evaporation. A transient hydrologic cycle is considered for the reservoir and its initial stored-water volume. The approach used to solve the problem is the sequential, unconstrained minimization technique (S.U.M.T.). S.U.M.T. is a stable and rapidly convergent method for optimization of nonlinear systems in which both the objective and the constraints are continuously twice differentiable (analytically or numerically). Further extensions to the proposed stochastic optimization procedure are described in Appendix A. (Bell-Cornell)

THE NATURAL VEGETATION OF THE SOUTHEAST SPANISH DRY AREA,
Goettingen Univ. (West Germany). Systematisch-Geobotanisches Institut.
H. Freitag.
Bot Jahrb Syst Pflanzengesch Pflanzengeogr, Vol 91, No 2/3, p 147-308, 1971, Illus, Map.
Identifiers: Climates, Cutting, Dry areas, Grazing, Mining, Succession, *Vegetation, *Spain.

A coastal belt about 300 km in length and 20-40 km in width, located in the provinces of Alicante, Murcia and Almeria was studied. Except in the mountain ranges the annual mean precipitation is less than 400 mm, in large tracts less than 300 mm, and drops down to 128 mm at Cabo de Gata. The vegetation has been heavily influenced by man. Mining (Ag) which resulted in a high demand for fuel for smelting processes; grazing; cutting of timber, fire- and brush-wood; and exploitation of fiber plants (Stipa tenacissima) led to extensive destruction of the natural vegetation and to the 'steppic' character of the area. Five plant communities with zonal distribution were recognized as the essential components of the natural vegetation: Quercetum rotundifoliae; Rhamno-Quercetum cocciferae; Querco-Lentiscetum; Asparago-Rhamnetum; Gymnosporio-Periplocetum. Detailed descriptions of the structure and floristic composition of these plant communities are given.--Copyright 1972, Biological Abstracts, Inc.

Identifiers: *Flood plain management, Impervious land cover, Impervious surfaces, Chicago River, *Lake County (Ill).

A synopsis of two reports on a hydrologic simulation model for the watershed of the North Branch of the Chicago River by Hydrocomp International is presented. The simulation model is used to help correct for urban development in a hydrologic data series to be used in statistical analyses. Various physical processes such as runoff, snow melting, and infiltration plus parameters including the amount of impervious land cover are incorporated into the model. The simulation model in conjunction with statistical analysis can then predict flood stages and be used in flood mapping programs under various given levels of urbanization. The basic conclusion is that urban development can continue upstream without significantly increasing downstream flood stages if flood plain storage is preserved upstream. If flood plain storage is reduced upstream, the hydrologic regime will be entirely altered and the peak discharge for a 100-year flood could double or triple. Thus, upstream land use planning and control of flood plain areas is the key to flood control. However, detention basins and levees are also useful, particularly to protect existing urban development in flood prone areas. (Elfers-North Carolina)

WATER SUPPLY PROJECTS IN DEVELOPING COUNTRIES,
Parsons (Ralph M.) Co., Los Angeles, Calif.
G. E. Arnold.
Journal of the American Water Works Association, Vol 62, No 12, p. 750-753, December, 1970.

Descriptors: *Water supply, Water treatment, Water users, Water rates, Economics, Labor supply, Income, Design, Equipment, Technology, *Training.
Identifiers: *International development agencies, Population growth, Improved living conditions, *Developing countries.

The best and most important way to improve living conditions in developing countries is to provide safe water supplies. Certain adjustments must be made by a western engineer when planning and building in a developing country. The stage of development, funds available, and local conditions must be considered. Two basic principles that must be followed are simplicity and economy. It is cheaper and more dependable in most cases, due to the unskilled manpower available, to employ more people rather than install automatic equipment. The engineering design work on these projects should be done in the project country, using local personnel wherever possible. In most cases AWWA standards will be acceptable. In setting water rates it is imperative that treated water be made available at an affordable price or the use of untreated water will continue; therefore, in many cases a reverse payment scale, charging large users more per unit than small users is a common practive. The training of operators is one of the most important phases of development and is usually part of the consulting engineer's contract. Operating and maintenance personnel are trained on site starting during the construction phase. Supervisory and management personnel are schooled at various locations such as the Public Health College of the University of North Carolina. Case studies of several recent projects are presented. MATHEMATICAL MANAGEMENT MODEL OF PARTS OF THE OGALLALA AQUIFER, TEXAS,
High Plains Underground Water Conservation District No. 1, Lubbock, Tex.
F. A. Rayner, D. M. Wells, B. J. Claborn, D. D. Smith, and A. J. Sechrist.
Available from the National Technical Information Service as PB-223 557, $4.50 in paper copy, $1.45 in microfiche. Final Report, July 1973. 111 p, 27 fig, 9 tab, 12 plates, 52 ref. OWRR C-2101 (H3363) (2).

Descriptors: *Aquifer characteristics, Computers, *Permeability, *Storage coefficient, *Optimization, *Texas, Groundwater, Mathematical models.
Identifiers: *Ogallala Aquifer, Slaton channel (Tex), Parmer County (Tex), Steepest descent.

A digital computer procedure was developed for predicting to ultimate depletion a water table aquifer in which the configuration of the base of the aquifer becomes a controlling parameter. A portion of the 'Slaton Channel', a buried valley in the Ogallala Aquifer near Slaton, Texas, was selected for modeling. A rectangular system of nodes, with a small node spacing, was found to be most advantageous from the standpoints of ease of programming, use of CPU time, and computer core storage requirements. The large number of nodes resulting from the small node spacing made the Gauss-Seidel iteration method of solving systems of quadratic equations impractical. A parameter adjustment procedure was developed using the steepest descent optimization procedure for minimizing errors in simulated water levels. This procedure treated permeability and storage coefficients, as well as net withdrawals, as variables for purposes of determining simulated water levels. The model developed in Phase I of the project was applied to Parmer County, Texas, after the completion of a very comprehensive investigation and report on groundwater conditions in August, 1971. The results of this application indicate that the model is applicable to any area for which accurate net withdrawal rates in the future can be established. (Wells-Texas)

RIVERSIDE'S GROUND WATER PUMPING SYSTEM.
FMC Corp., Los Angeles, Calif. Peerless Pump Div.

Water and Sewage Works, Vol 120, No 4, p 100-101, May 1973.

Descriptors: *Pumped storage, *Groundwater availability, *Water wells, *Pumping, Water supply development, Water table, *California, Reservoir storage, Colorado River Compact, Metropolitan Water Dist. of So. Cal., municipal water, Subsurface waters, Water conveyance, Water distribution (Applied), River basins.
Identifiers: Santa Ana River basin (Calif), *Riverside (Calif).

Riverside, California, located in the Santa Ana River basin, obtains practically its entire water supply from local wells. This underground river carries a steady flow of water from the San Bernardino Mountains to the Pacific Ocean. The water table varies from year to year, depending on an average rainfall range of 5-15 inches, with an actual rise in the water table caused by heavy floods that inundated the area 2 years ago. Water is pumped from an average depth of 100 feet, aided enroute by booster pumps, to the City's 32-million gallon storage reservoir. These booster pump stations, located around the City, maintain adequate pressure to provide a steady flow of water at all times of the year, especially at higher elevations. Two percent of the water in the City's system comes from a connection with the Colorado River water distribution system and the Metropolitan Water District. Planning projections for the future indicate that Riverside's underground water resources will provide at least two-thirds of its needs. (Bahre-Arizona)

TEMPERATURE PROSPECTING FOR SHALLOW GLACIAL AND ALLUVIAL AQUIFERS IN ILLINOIS,
Illinois State Geological Survey, Urbana.
K. Cartwright.
Circular No. 433, 1968. 41 p, 27 fig, 4 tab, 42 ref.

Descriptors: *Exploration, Prospecting, Geophysics, On-site investigations, Remote sensing, *Subsurface investigations, Water sources, Equations, Electronic equipment, Research equipment, *Aquifer characteristics, Thermal properties, *Specific heat, *Illinois.
Identifiers: Heat sink, Temperature anomaly, Electronic thermometer, Glacial Alluvial deposits, *Groundwater exploration.

Most geophysical techniques used in the exploration for ground water measure some property of the rocks, rather than properties of water. However, the presence of water in the rocks affects the results somewhat in electrical earth resistivity and seismic methods, the most commonly used exploration techniques. A property that may be exploited in ground-water exploration is the high specific heat of water or its resistance to changes in temperature. Theoretical considerations of glacial and alluvial deposits suggest that a saturated aquifer may disturb the geothermal gradient by acting as a heat sink (absorbing heat) (Lovering and Goode, 1963) or heat source. This disturbance may influence the surface soil temperature. If surface soil temperature variations resulting from disturbance of the geothermal gradient by a shallow aquifer can be measured, the presence of the aquifer might be detected. (Smith-NWWA)

FIBERGLASS PLASTIC CASING OVERCOMES CORROSION PROBLEM IN WATER WELLS IN WEST PAKISTAN,
Tepton and Kalmbach, Inc., Denver, Colo.
D. K. Smith.
Society of Mining Engineers, AIME, Transactions, Vol 244, No 1, p 24-28, March, 1969.

Descriptors: *Corrosion control, *Bacteria, *Water quality control, Water analysis, Materials, *Water wells, Bactericides, *Irrigation systems.
Identifiers: *Well rehabilitation, *Sulfate-reducing bacteria, Chlorine shock treatment, Incrustation, *Fiberglass plastic pipe, *Pakistan.

The Reclamation Program for the Northern Zone of the Indus Plains in West Pakistan involves the construction of 30,000 irrigation wells to serve 20 million acres with an annual pumpage of nearly 40 million acre-ft. Detailed hydrologic studies indicated that mild steel would be satisfactory for casing; however, within two years after construction, about 10% of the wells began to fail due to encrustation and corrosion of the casing. A search to find a noncorrosive substitute for the steel casing disclosed that only fiberglass-reinforced plastic pipe satisfied all requirements. The results of initial use of fiberglass have been highly satisfactory and have resulted in a lower over-all well cost. Advances in technology promise further reduction in prices and improvement in performance. (Smith-NWWA)

4D. Watershed Protection

RUNOFF, EROSION, AND TILLAGE EFFICIENCY ON GRADED-FURROW AND TERRACED WATERSHEDS,
Agricultural Research Service, Temple, Tex. Blackland Conservation Research Center.
C. W. Richardson.
Journal of Soil and Water Conservation, Vol 28, No 4, p 162-164, July-August 1973. 3 fig, 2 tab, 5 ref.

Descriptors: *Erosion control, *Terracing, *Water control, Rainfall-runoff relationships, Soil conservation, Contour furrows, Contour farming, Contours.
Identifiers: *Graded furrows.

Runoff, soil loss, and farm tillage efficiencies of a graded-furrow system were compared with those of a terrace system. Runoff was significantly less from the graded-furrow area than from the terraced area, and erosion from the two areas was essentially equal. Tillage rates were about 21 percent faster on the graded-furrow area than on the terraced area. The graded-furrow system functioned well during an intense storm that caused terrace failure on many adjacent areas. (Knapp-USGS)

WATER YIELD AND EROSION RESPONSE TO LAND MANAGEMENT,
Agricultural Research Service, Council Bluffs, Iowa. North Central Watershed Research Center.
R. G. Spomer, K. E. Saxton, and H. G. Heinemann.
Journal of Soil and Water Conservation, Vol 28, No 4, p 168-171, July-August 1973. 3 fig, 3 tab, 7 ref.

Descriptors: *Water yield, *Sediment yield, *Erosion control, *Terracing, *Contour farming, Contours, Loess, Land management, Contour furrows, Iowa, Topography, Rainfall-runoff relationships.

Nearly equal water yields on level-terraced corn and contoured-corn watersheds were found in 8 years' observation of five research watersheds. Water yield from a grassed watershed was 37 percent less. Surface runoff was 10 percent of water yield from the terraced watershed and 65 percent of water yield from the contoured watersheds. Peak runoff rates from terraced-corn and grassed watersheds were 10 percent of those from contoured-corn watersheds. Sheet erosion averaged 24 tons per acre per year on the contoured-corn watersheds and less than 1 ton per acre per year from the terraced-corn watersheds. Gully erosion averaged 450 tons per year from the contoured-corn watershed, but was negligible on the terraced and grassed watersheds. (Knapp-USGS)

INFILTRATION, HYDRAULIC CONDUCTIVITY, AND RESISTANCE TO WATER-DROP IMPACT OF CLOD BEDS AS AFFECTED BY CHEMICAL TREATMENT,
Iowa State Univ., Ames. Dept. of Soil Science.
D. M. Gabriels, W. C. Moldenhauer, and D. Kirkham.
Soil Science Society of America Proceedings, Vol 37, No 4, p 634-637, July-August 1973. 4 tab, 15 ref.

Descriptors: *Infiltration, *Soil erosion, *Impact (Rainfall), *Erosion control, *Soil treatment, Soil structure, Soil sealants, Soil stability, Water proofing, Wetting, Wettability.
Identifiers: Soil conditioners.

To test the effectiveness of surface treatments in preventing erosion during rainfall, chemicals and bitumen were sprayed on large dry surface clods (8 to 20 mm) and small surface clods (2 to 8 mm) of a Clarion loam. The small clods were initially wetted with 15% water on a soil weight basis and mixed with bitumen emulsions. The large and small clods were subjected to a 6.35-cm-per-hour simulated rainfall. Simultaneously with the measurements of infiltration rate, determinations were made of the starting time for initial runoff, energy needed to initiate runoff, runoff rate, total soil loss, and final

soil loss rate. Most of the soil conditioners on large clods kept the infiltration rate high and prevented runoff on a 9% slope. Polyvinyl alcohol and polyacrylamide prevented any soil loss during 90 min. Surface applications with bitumen emulsions were also highly effective in preventing erosion of large clods but were less effective for small clods. When the bitumen emulsions were mixed with the small clods, the saturated hydraulic conductivity was very high. The infiltration rate was low because water would not enter the clod bed and stable clods were carried in the runoff water. (Knapp-USGS)
W73-14413

MIDDLETOWN STREAMBELT REPORT.
Soil Conservation Service, Washington, D.C.

Prepared for the Town of Middletown, Connecticut, published by Eastern Connecticut Resource Conservation and Development Project, March 1973. 25 p, 2 tab, 1 map, append.

Descriptors: *Streambeds, *Conservation streams, Banks, Connecticut.
Identifiers: *Streambelts, *Middletown (Conn), Mattabesset River (Conn), *Connecticut River basin.

The city of Middletown is divided into twenty-three watershed areas. Within the watersheds, streambelts are identified, along with major potential water development sites and other significant features. A streambelt is a corridor which includes a watercourse, floodplains, lakes and ponds associated with the stream, potential water development sites of public significance, areas in proximity to streams where certain potential land uses would have probable adverse environmental effects, and contiguous lands with special beneficial and environmental values. The study is one phase of inventorying natural resources of the city. It is the result of field reconnaissance and map studies. There is evidence of streambelt encroachment by development. Eleven conditions are identified in which streambelt protection serves the public interest. Among these are protection of areas of vital importance in the preservation of significant ecological systems; retention of potential impoundment sites for beneficial water uses such as flood control, water supply, wildlife habitat, and recreation; protection of water quality and high yielding ground water areas that are important to water supply; maintaining a framework of environmental corridors of high quality with close proximity to neighborhood and population centers. 5A. Identification of Pollutants

SELECTED PESTICIDES IN AQUATIC FUNGI IN THE THREE RIVERS AREA,
Michigan State Univ., East Lansing. Dept. of Botany.
E. S. Beneke, and K. L. O'Donnell.
Available from the National Technical Information Service as PB-223 372, $3.00 in paper copy, $1.45 in microfiche. Institute of Water Research, Michigan State University, Project Completion Report, August 1973. 16 p, 10 fig, 3 tab, 16 ref. OWRR A-057-MICH (1). 14-31-0001-3522.

Descriptors: *DDT, Dieldrin, Ambient light, *Aquatic fungi, Metabolism, *Pesticide residues, *Michigan, Protozoa, Monitoring, Pollutant identification.
Identifiers: *Saprolegniaceous fungi, Ciliated protozoan, Fungal inocula, Protozoan inocula, DDT monitors, *Gas-liquid chromatography, Metabolites, Red Cedar River (Mich), Au Sable River (Mich).

This study involved the collection and identification of saprolegniaceous fungi in the Red Cedar and Au Sable Rivers. The most common species were studied in the laboratory and in the Red Cedar River to determine their ability to uptake and metabolize DDT. The value of these aquatic fungi as pesticide monitors was also investigated. In addition, the transfer of DDT from aquatic fungi to a ciliated protozoan was studied. No discernible correlation exists between pollution aspects of the habitat and species occurrence of the saprolegniaceous fungi in the Red Cedar and Au Sable Rivers. However, the use of special baits and extensive sampling may yield a technique of greater sensitivity. Dictyuchus monosporus was the most abundant saprolegniaceous species collected during the sampling periods in the Red Cedar and Au Sable Rivers. The use of twigs, leaves, and bottom sediment appears to be a more effective method for the isolation of these aquatic fungi than the aluminum tea ball method. The four species of aquatic fungi studied, Dictyuchus monosporus, Saprolegnia parasitica, Achlya americana, Aphanomyces sp., were able to concentrate DDT at levels much higher (37.5 to 135 fold within the first 24 hours) than the ambient concentrations in the nutrient media. In addition, Saprolegnia parasitica was able to concentrate DDT by 6.75 fold in soil amended with this pesticide. Tetrahymena pyriformis was able to concentrate this pesiticide by 12 fold over the ambient concentration in the nutrient medium.

AN ASSESSMENT OF AUTOMATIC SEWER FLOW SAMPLERS,
Hydrospace-Challenger, Inc., Rockville, Md.
P. E. Shelley, and G. A. Kirkpatrick.
Copy available from GPO Sup Doc as EP1.23/2:73-261, $2.60; microfiche from NTIS as PB-223 355, $1.45. Environmental Protection Agency Technology Series Report EPA-R2-73-261, June 1973. 233 p, 23 fig, 4 tab, 29 ref. EPA Contract 68-03-0155.

Descriptors: Automatic control, Pollutants, Hydraulics, *Sampling, Antomation, *Flow measurement, Instrumentation, Sewers, *Storm drains, Storm runoff, Measurement, Water sampling, Design flow, *Reviews.
Identifiers: *Combined sewer flows, *Automatic samplers.

A brief review of the characteristics of storm and combined sewer flows is followed by a general discussion of the purposes for and requirements of a sampling program. The desirable characteristics of automatic sampling equipment are set forth and problem areas are outlined. A compendium of over 60 models of commercially available and custom designed automatic samplers is given with descriptions and characterizations of each unit presented along with an evaluation of its suitability for a storm and/or combined sewer application. A review of field experience with automatic sampling equipment covering problems encountered and lessons learned. A technical assessment of the state-of-the-art in automatic sampler technology, and design guides for development of a new, improved automatic sampler for use in storm and combined sewers are presented. (EPA)
W73-14221

ATOMIC ABSORPTION ANALYSIS OF PHOSPHATES IN WATER,
Wisconsin Univ., Milwaukee. Dept. of Chemistry.
C. O. Huber.
Available from the National Technical Information Service as PB-223 338, $4.50 in paper copy, $1.45 in microfiche. Environmental Protection Agency Report EPA-670/2-73-079, October 1973. 35 p, 3 fig, 7 tab, 7 ref. EPA Project 16020 DHD

Descriptors: Absorption, *Phosphates, Water analysis, *Sulfates, *Silicates, *Pollutant identification.
Identifiers: *Inhibition titration, *Atomic absorption analysis.

The project investigated utilization of phosphate, silicate, and sulfate chemical inhibition effects in magnesium atomic absorption spectrometry for the purpose of determination of these anions. The variables found to be of greatest significance in the inhibition processes were flame temperature and solution stoichiometry. The procedure termed 'atomic absorption inhibition titration' (AAIT) was developed. It provides useful, new determination methods for single anions and also for simultaneous determination of phosphate, silicate, and sulfate in a single sample. The methods have been evaluated and applied to water and waste water samples. (Booth-EPA)
W73-14223

APPLICATION OF OXINE IN THE POLAROGRAPHIC ANALYSIS OF ORGANOMETALLIC COMPOUNDS. MICRODETERMINATION OF CADMIUM, MAGNESIUM, ZINC, MANGANESE, AND COBALT,
Institut National des Sciences et Techniques Nucleaires, Saclay (France).
S. W. Bishara.
Mikrochimica Acta, No 1, p 25-32, 1973. 1 fig, 1 tab, 12 ref.

Descriptors: *Cadmium, *Magnesium, *Zinc, *Manganese, *Cobalt, *Polarographic analysis, Heavy metals, Chemical analysis, Alkaline earth metals, Hydrogen ion concentration, Chemical reactions, Chemical precipitation.
Identifiers: *Organometallics, Oxine, Accuracy, Errors.

A procedure for the microdetermination of Cd, Mg, Zn, Mn, and Co in organometallic compounds is presented. After closed-flask combustion, the metal-oxine complex is precipitated from an ammonia-ammonium chloride buffered medium of pH 10. At this pH value oxine gives a well-defined polarographic wave. The wave height of an excessive volume of oxine is measured before and after it has been used to precipitate a known weight of the organometallic compound. The method is simple and rapid; one determination consumes 25 minutes. The average percent error amounts to plus or minus 0.53. (Holoman-Battelle)
W73-14244

SEPARATION OF MOLYBDENUM FROM TUNGSTEN, VANADIUM, IRON, URANIUM AND SEVERAL OTHER INTERFERING ELEMENTS BY EXTRACTION OF ITS THIOSULPHATO COMPLEX,
Kurukshetra Univ. (India). Dept. of Chemistry.
V. Yatirajam, and J. Ram.
Mikrochimica Acta, No 1, p 77-86, 1973. 5 tab, 10 ref.

ICRO AND SEMIMICRO DETERMINATION ARSENATE USING ION-SELECTIVE ELEC-RODES,
lifornia Univ., Livermore. Lawrence Liver-re Lab.
Selig.
krochimica Acta, No 3, p 349-359, 1973. 3 fig, 4 , 25 ref.

escriptors: *Methodology, *Pollutant identifica-n, Analytical techniques.
entifiers: *Ion selective electrodes, *Arsenates, tentiometric titration, Fluoride electrodes, Lead ectrodes.

n indirect method for the microestimation of 0.75 15 ppm (0.01-0.2 mM) of As (V) has been scribed: Arsenate is precipitated with nthanum nitrate at a pH of 8.65. The excess of nthanum is titrated with standard fluoride, using fluoride ion-selective electrode. Equivalence ints are located on volume-corrected Gran's ot paper. This method can also be used to esti-ate the sum of arsenate and phosphate. For rger amounts of arsenate and for increased preci-on and accuracy, potentiometric titration with ad perchlorate, using a lead ion-selective elec-ode, is recommended. Other possibilities for termining arsenate and a method for estimating ngstate are suggested. (Holoman-Battelle)

ON THE VARIABILITY OF STEPHANODISCUS HANTZSCHII GRUN., (UBER DIE VARIABILITAT VON STEPHANODISCUS HANTZSCHII GRUN),
Rostock Univ. (East Germany). Institut fuer Hygiene.
L. Kalbe.
Hydrobiologia, Vol 42, No 1, p 21-29, July 6, 1973. 5 fig, 19 ref.

Descriptors: *Systematics, *Diatoms, *Ecology, Benthic flora, Phytoplankton.
Identifiers: *Stephanodiscus hantzschii var. pusillus, *Stephanodiscus hantzschii var. striatior, Warmow River, Malchiner Peene River, Neukalener Peene River, Lake Kummerow, *Germany.

A new variety, striatior, of the diatom Stephanodiscus hantzschii GRUN. (S. h.) with denser striae was described (Kalbe 1971). The validity of S.h. var. pusillus is confirmed by specimens from freshwaters of the north of Mecklenburg. The species S.h. probably consists in this region of several races with different peaks of valve diameter variation. The planktonic mass changing of S.h. and its forms in the three rivers Warnow, Malchiner Peene and Neukalener Peene and in the Lake Kummerow is represented. The differences of the average valve sizes in these waters are remarkable. Var. pusillus GRUN. appears to be a benthic mass form, too. High cell numbers and high cell volume sums are not developing ever simultaneously. Var. pusillus is not a suitable form for evaluating the saprobiological status, for it is adaptable to different ecological conditions. The species S.h. itself is a beta- to alphamesosaprobic organism, being able to produce high cell numbers within this range of saprobity. (Little-Battelle)

THE EPIPHYTIC DIATOM FLORA OF THE BENTHIC MACROPHYTE COMMUNITIES ON ROCKY SHORES IN THE SOUTHWESTERN ARCHIPELAGO OF FINLAND, SEILI ISLANDS,
Turku Univ. (Finland). Dept. of Botany.
H. Rautiainen, and O. Ravanko.
Nova Hedwigia, Vol 23, No 4, p 827-842, 1972. 8 fig, 15 ref.

Descriptors: *Diatoms, *Marine algae, *Biological communities, Marine plants, Speciation, Systematics, Pondweeds, Chlorophyta, Chrysophyta, Phaeophyta, Rhodophyta, Intertidal areas, Benthic flora, Cyanophyta, Epiphytology, Water sampling, Classification, Statistical methods, Kelps.
Identifiers: *Epiphytes, *Macrophytes, Sample preparation, Finland, Seili Islands, Gyrosigma, Licmophora, Rhizosolenia, Surirella gemma, Surirella ovata, Surirella striatula, Potamogeton spp, Cladophora glomerata, Fucus vesiculosus, Pilayella littoralis, Ceramium tenuicorne, Calothrix scopulorum, Achnanthes spp.

An analysis of the epiphytic diatom flora was carried out in connection with a study of the benthic macrophyte communities in the SW archipelago of Finland, Seili Islands (Ravanko, 1972). Samples were taken from macrophytes collected from quadrats (1 sq m) on 13 lines. Preparations were made by pulverizing and homogenizing the macrophyte material to which was then added strong hydrogen peroxide. This mixture was allowed to stand 2-3 days at room temperature or 2 days at 40-50C to allow the digestion of organic matter. Test tubes containing the mixture were then centrifuged and the material transferred to a cover glass, dried, and mounted in Clearax for microscopic observations. The diatoms were determined and counted; results relating to the same macrophyte belt were combined. The percentages of each diatom species in the different belts were calculated. The occurrence in the macrophyte belts of diatoms with percentages of five or more is presented in diagrams. No clear zonation of diatoms was distinguished corresponding to the macrophyte belts, but statistical analysis showed that on most lines the macrophyte belts differed from each other in regard to their epiphytic diatom flora. The species composition of the epiphytic diatom flora is discussed and compared with that of other areas. (Holoman-Battelle)

VERSATILE COMBUSTION-AMALGAMATION TECHNIQUE FOR THE PHOTOMETRIC DETERMINATION OF MERCURY IN FISH AND ENVIRONMENTAL SAMPLES,
National Marine Fisheries Service, Ann Arbor, Mich. Great Lakes Fishery Lab.
W. A. Willford, R. J. Hesselberg, and H. L. Bergman.
Journal of the Association of Official Analytical Chemists, Vol 56, No 4, p 1008-1014, July 1973. 3 fig, 3 tab, 16 ref.

Descriptors: *Mercury, *Chemical analysis, Fish, *Methodology, *Pollutant identification, Plant tissues, Sediments, Photometry, Water analysis, Soil analysis, Lake sediments, Heavy metals, Coho salmon, Lake Michigan, Coals, Aquatic plants.
Identifiers: *Environmental samples, *Biological samples, Chemical interference, Detection limits, Precision, Sensitivity, Accuracy, Sample size, Sample preparation, Chemical recovery, Amalgamation, Animal tissues, Reproducibility, Chara, Muscle.

Total mercury in a variety of substances is determined rapidly and precisely by direct sample combustion, collection of released mercury by amalgamation, and photometric measurement of mercury volatilized from the heated amalgam. Up to 0.2 g fish tissue is heated in a stream of 02 (1.2 1/min) for 3.5 min in 1 tube of a 2-tube induction furnace. The released mercury vapor and combustion products are carried by the stream of 02 through a series of traps (6 percent NaOH scrubber, water condenser, and Mg (C104)2 drying tube) and the mercury is collected in a 10 mm diameter column of 24 gauge gold wire (8 g) cut into 3 mm lengths. The resulting amalgam is heated in the second tube of the induction furnace and the volatilized mercury is measured with a mercury vapor meter equipped with a recorder-integrator. Total analysis time is approximately 8 min/sample. The detection limit is less than 0.002 microgram and the system is easily converted for use with other biological materials, water, and sediments. Major advantages of the method include: simplicity of operation; speed of complete analysis; high sensitivity, precision, and accuracy; small sample size required; freedom from rigorous and sometimes hazardous acid-digestion procedures; freedom from reagent and glassware contamination; and comparatively low cost of equipment. Disadvantages of the method include: somewhat limited usable range of sensitivity (0.02-5.0 ppm); a general inability to analyze highly contaminated samples (greater than 5.0 ppm) without the use of a gas stream splitter or an extremely small sample; necessity for frequent changes in attenuation of mercury vapor meter, unless previous knowledge permits grouping of samples within ranges having less than a 5-fold difference inconcentration; and increased emphasis on the need for well homogenized representative samples. Minor changes in the system or substitution of a less sensitive mercury vapor meter would overcome many of these disadvantages when they are restrictive for a particular use. (Holoman-Battelle)

RETENTION OF MERCURY WHEN FREEZE-DRYING BIOLOGICAL MATERIALS,
National Bureau of Standards, Washington, D.C. Analytical Chemistry Div.
P. D. LaFleur.
Analytical Chemistry, Vol 45, No 8, p 1534-1536, July 1973. 5 tab, 6 ref.

Descriptors: *Mercury, *Radioactivity techniques, Aqueous solutions, Heavy metals
Identifiers: *Biological samples, *Freeze drying, *Feces, Methylmercuric chloride, Sample preparation, Phenylmercuric acetate, Chemical recovery, Precision, Tissue, Muscle, Blood, Liver, Brain, Kidneys, Heart, Organomercury compounds, Methylmercury, Lyophilization.

Guinea pigs and rats were fed foods containing Hg-203 labelled phenylmercuric acetate, methylmercury chloride, or inorganic mercury for use in tests to determine whether mercury losses occur during lyophilization (freeze drying) of biological samples. Upon sacrifice, the animals were dissected, and the liver, kidney, heart, brain, muscle, spleen and samples of blood taken for study. Feces were also collected during the feeding regimen. The samples were weighed, the relative mercury content determined radiometrically, and frozen. The samples were then lyophilized and the mercury content was again determined radiometrically. Net loss of mercury was calculated after making appropriate decay corrections. Of a total of over 30 tissue samples from animals fed methylmercury chloride, the mean mercury loss was less than 3 percent. Of the 10 organ samples from animals fed inorganic mercury and 11 tissue samples from those fed phenylmercuric acetate, the mean loss was less than 2 percent. Loss from blood was negligible, loss from feces was approximately 10 percent. Additional tests to determine the effects of pretreatment by freezing and time of lyophilization showed that neither affected loss of mercury. Freeze drying of aqueous solutions resulted in losses up to 90 percent for the organomercurials and 10 percent for inorganic mercury. (Little-Battelle)

COLLABORATIVE STUDY OF THE RECOVERY AND GAS CHROMATOGRAPHIC QUANTITATION OF POLYCHLORINATED BIPHENYLS IN CHICKEN FAT AND POLYCHLORINATED BIPHENYL-DDT COMBINATIONS IN FISH,
Food and Drug Administration, Minneapolis, Minn.
L. D. Sawyer.
Journal of the Association of Official Analytical Chemists, Vol 56, No 4, p 1015-1023, July 1973. 6 tab, 13 ref.

Descriptors: *Polychlorinated biphenyls, *Poultry, *Fish, *DDT, *Chemical analysis, Chlorinated hydrocarbon pesticides, Methodology, DDE, DDD, Pesticide residues.
Identifiers: Animal tissues, *Electron capture gas chromatography, Chemical recovery, *Fat tissue, Quantitative analysis, Interlaboratory studies, Isomers, Aroclor 1260, Aroclor 1254, Aroclor 1242, Gas liquid chromatography, Collaboratove studies, Precision, Animal fat, Sample preparation, p p' DDE, p p' TDE, p p' DDT, o p' DDT, Biological samples.

Nine laboratories collaborated on the analyses of PCBs in chicken fat and DDT-PCB combinations in fish. Existing AOAC multipesticide methodology with GLC quantitation was employed. One solution containing a mixture of Aroclors 1254 and 1260 was analyzed by GLC only. The fish samples were subjected to a published silicic acid procedure for separating the DDT-PCB mixtures. The DDT analogs were quantitated before and after the separation. The PCB content was quantitated by total peak height and total area comparisons against appropriate Aroclor (s) , using electron capture GLC, and additionally in 6 laboratories by total area comparisons, using halogen-specific detection. The electron capture GLC data demonstrated better accuracy and precision. The following PCB recoveries were obtained by using total peak height comparisons: 5 ppm mixed Aroclor solution, 100 plus or minus 4 percent; 8 ppm Aroclor 1242-fortified chicken fat, 101 plus 13 percent; 7.5 ppm Aroclor 1248-fortified chicken fat, 96 plus or minus 9 percent, incurred Aroclor 1242 chicken fat, 9.2 ppm plus or minus 8 percent; 6 ppm Aroclor 1254-fortified fish, 75 plus or minus 14 percent; 6 ppm Aroclor 1260-fortified fish, 75 plus or minus 15 percent; and an environmentally incurred residue in fish, 4.5 ppm plus or minus 20 percent. The 2 Aroclor-fortified fish samples were concurrently spiked with the p,p'-isomers of DDE, TDE, and DDT at levels of 4, 1, and 3 ppm, respectively. After silicic acid separation the combined recoveries for these 2 samples were DDE, 86 plus or minus 13 percent; TDE, 89 plus or minus 20 percent; and DDT 84 plus or minus 17 percent. Environmentally incurred-DDT residues were recovered at 4.1 ppm plus or minus 14 percent for p, p'DDE, 0.7 ppm plus or minus 24 percent for o, p'-DDT and 2.7 ppm plus or minus 17 percent for p p'-DDT. The DDT values calculated before the silicic acid separation compared favorably with those summarized. The multiresidue method for chlorinated pesticides, 29.001-29.027,, has been adopted official first action to include polychlorinated biphenyls in poultry fat and fish. (Holoman-Battelle)

LIQUID CHROMATOGRAPHY-MASS SPECTROMETRY. COUPLING OF A LIQUID CHROMATOGRAPH TO A MASS SPECTROMETER,
Georgia Univ., Athens. Dept. of Biochemistry.
R. E. Lovins, S. R. Ellis, G. D. Tolbert, and C. R. McKinney.
Analytical Chemistry, Vol 45, No 8, p 1553-1556, July 1973. 8 fig, 7 ref.

Descriptors: *Chlorinated hydrocarbon pesticides, *Laboratory equipment, *Pollutant identification, DDT, DDD, Dieldrin, *Chromatography, *Mass spectrometry, Instrumentation, Design.
Identifiers: Liquid chromatography, LC-mass spectrometry, Sulfathiazole, Sulfanilamide, Sulfamethazine, Anthraceine, Pyrene, Chrysene, Naphthalene, Chromatograms.

Because of the increasing utility of liquid chromatography in analytical and bio-analytical problems, the need for a reliable method of analyzing and identifying the effluent peaks generated by the liquid chromatograph has become apparent. For this purpose a system was designed to couple the liquid chromatograph to a mass spectrometer. The interface consisted of a motor driven probe to accept the effluent peaks from a liquid chromatograph, separate the solute from the solvent by flash evaporation in the probe tip, and automatically insert the isolated material into the ion source of the mass spectrometer for analysis. Results are given for the analysis of dieldrin, DDT, DDD, sulfathiazole, sulfanilamide, sulfamethazine, anthracene, pyrene, chrysene, and naphthalene. (Little-Battelle)

ASBESTOS FIBERS IN BEVERAGES, DRINKING WATER, AND TISSUES: THEIR PASSAGE THROUGH THE INTESTINAL WALL AND MOVEMENT THROUGH THE BODY,
Department of National Health and Welfare, Ottawa (Ontario). Food and Drug Research Lab.
H. M. Cunningham, and R. D. Pontefract.
Journal of the Association of Official Analytical Chemists, Vol 56, No 4, p 976-981, July 1973. 4 fig, 4 tab, 11 ref.

Descriptors: *Asbestos, *Electron microscopy, *Foods, *Rain, *Potable water, Rivers, Neutron activation analysis, Separation techniques, Water

pollution effects, Water pollution sources, Air, Air pollution, Water analysis, Snow, Path of pollutants, Distribution, Canada.
Identifiers: *Biological samples, Tissue, Blood, Spleen, Liver, Kidney, Omentum, Muscle, Lung, Brain, Soft drinks, Beer, Wine, Ottawa River, Sample preparation.

Methods were developed using an electron microscope to isolate and count asbestos fibers in liquids and tissues, Fibers were detected in beer, sherry, port, vermouth, soft drinks, and city drinking water at levels generally ranging from 1 to 11 million per liter. River water was higher in asbestos fibers than water passed through a city filtration system, and melted snow was considerably higher than river water. Asbestos fibers were also detected in parenteral solutions. Distribution studies on asbestos fibers administered to rats were performed with the electron microscope and were supplemented with studies using both tritiated and neutron-activated asbestos. Crysotile fibers were injected into the stomachs of rats and 2-4 days later fibers were isolated from the blood spleen, liver, kidney, omentum, muscle, lung, and brain. Highest levels of orally administered fibers were found in the omentum; intravenously injected fibers resulted in highest levels in the liver and the lung. (Little-Battelle)

QUANTITATIVE PERCHLORINATION OF POLYCHLORINATED BIPHENYLS AS A METHOD FOR CONFIRMATORY RESIDUE MEASUREMENT AND IDENTIFICATION.
Food and Drug Administration, Washington, D.C. Div. of Chemical Technology.
J. A. Armour.
Journal of the Association of Official Analytical Chemists, Vol 56, No 4, p 987-993, July 1973. 3 fig, 4 tab, 10 ref.

Descriptors: *Polychlorinated biphenyls, *Pollutant identification, *Chemical analysis, Methodology, Chemical reactions, Poultry, *Gas chromatography.
Identifiers: *Perchlorination method, Electron capture gas chromatography, Derivatives, Mixtures, *Quantitative analysis, Sample preparation, Decachlorobiphenyl, Chemical recovery, Aroclor 1242, Aroclor 1016, Aroclor 1248, Aroclor 1254, Aroclor 1260, Aroclor 1262, Chubs, Sturgeon, Animal tissues, Eggs, Fat, Sensitivity, Gas liquid chromatography.

The perchlorination procedure for derivatization of PCBs described by Berg, Diosady, and Rees has been modified to achieve a micro-scale quantitative conversion (greater than 90 percent) of commercial PCB preparations (Aroclors) to decachlorobiphenyl. Cleaned up sample extracts containing PCB residues (1-20 micrograms) are allowed to react with antimony pentachloride in the presence of chloroform to form decachlorobiphenyl. This procedure converts a multicomponent mixture to a single derivative detectable by electron capture GLC, thus providing an easy method for quantitating and identifying PCB residues and at the same time increasing the sensitivity of detection. The usefulness of the perchlorination procedure is demonstrated by comparing results for environmentally contaminated samples quantitated by 2 methods: by measuring the total area of the electron capture response for the residue against the Aroclor it most closely resembles, and by measuring the single peak of the decachlorobiphenyl derivative and expressing the results in terms of the particular Aroclor. (Homoman-Battelle)

POLYCHLORINATED TERPHENYLS AS POTENTIAL CONTAMINANTS OF ANIMAL PRODUCTS,
Agricultural Research Service, Beltsville, Md. Agricultural Environmental Quality Inst.
G. F. Fries, and G. S. Marrow.
Journal of the Association of Official Analytical Chemists, Vol 56, No 4, p 1002-1007, July 1973. 5 fig, 9 ref.

Descriptors: *Milk, *Silage, *Pollutant identification, *Chemical analysis, Sealants, Pollutants, Solvent extractions, *Gas chromatography.
Identifiers: *Polychlorinated terphenyls, Electron capture gas chromatography, Aroclor 5460, Sample preparation, Chemical recovery, Tetradecachloroterphenyls, Chemical interference, Gas liquid chromatography, Cleanup, Derivatives.

Evidence is presented of the presence of polychlorinated terphenyl (PCT) residues in samples of wall scrapings, silage and milk from farms where the PCT, Aroclor 5460 has been used in a sealant for concrete stave silos. Milk end silage samples were extracted and cleanup up using FDA multipesticide residue methodology; wall scrapings and the sealant sample were extracted and diluted, respectively, with hexane and examined by electron capture GLC without further cleanup. The cleaned up samples were chlorinated with SbC15 to form the 3 tetradecachloroterphenyl derivatives which facilitates identification of PCT residues by electron capture GLC. This work demonstrates that milk produced on farms with contaminated silos will contain PCT residues. Since the PCB and PCT residues are from the same source, correction of the PCB problem will also eliminate the PCT residues. The silo situation does provide good opportunity to study the comparative behavior of the 2 classes of compounds under environmental conditions. If the behavior is similar, it may be possible to predict the distribution and levels of PCT residues from information available on PCBs. (Holoman-Battelle)

COBALT INTERFERENCE IN THE NON--STEADY STATE CLEAN WATER TEST,
Camp, Dresser and McKee, Boston, Mass.
A. A. Kalinske, L. D. Lash, and G. L. Shell.
Water and Sewage Works, Vol 120, No 7, p 54-59, July 1973. 11 fig, 4 ref.

Descriptors: *Cobalt, *Dissolved oxygen, *Chemical analysis, *Water analysis, Heavy metals, Aeration, Methodology, Water quality, Water pollution, Cations, Laboratory tests.
Identifiers: *Ionic interference, *Chemical interference, *Winkler method, Error sources, Non-steady state reoxygenation test, Oxygen diffusion coefficient, Errors.

The purpose of this study was to evaluate the non-steady state method for determining oxygen transfer by aeration. It was observed that when sodium sulfite was used to deoxygenate the test water more than 0.05 mg/l cobalt ion concentration caused a chemical interference in the Winkler dissolved oxygen determination. This chemical interference varied with the cobalt ion concentration, the number of sulfite additions, the aeration period between tests and C sub s (saturation value for oxygen under test conditions). Values of oxygen input efficiency reported for aerators tested with cobalt ion concentrations greater than 0.05 mg/l can be high by as much as 10 to 50 percent. The degree of error will depend on the amount of cobalt ion used and the number of sulfite additions. If higher cobalt ion concentration is used, then the dissolved oxygen must be measured using a fast response dissolved oxygen probe. A meter which achieves 99 percent of the true value in 15 seconds (after swinging full scale) should be satisfactory. Cobalt interference in the determination of dissolved oxygen (Winkler method) in the non-steady state reoxygenation method may be reduced to insignificant levels by use of no higher than 0.05 mg/l cobalt ion. (Holoman-Battelle)
W73-14281

A RAPID, SENSITIVE METHOD FOR THE DETERMINATION OF THE CHEMICAL OXYGEN DEMAND OF POLLUTED WATERS,
Oak Ridge National Lab., Tenn.
W. W. Pitt, S. Katz, and L. H. Thacker.
In: Water-1972, AIChE Symposium Series, No 129, Vol 69, p 1-5, 1973. 2 tab, 8 ref, append.

Descriptors: *Chemical oxygen demand, *Water pollution, *Methodology, *Water analysis, *Chemical analysis, Waste water (Pollution), Organic compounds, Industrial wastes, Sewage effluents, Treatment facilities, Oxidation, Linear alkylate sulfonates, Natural streams.
Identifiers: *Cerate oxidation method, Acetic acid, Acetone, Benzene, Glucose, Ethanol, Glycine, Pyridine, Sodium lauryl sulfate.

A rapid, sensitive cerate oxidation method for measuring the chemical oxygen demand (COD) of waters is described. The pollutants are oxidized with perchloratocerate reagent, and the resulting cerium (III) is determined fluorometrically. Analysis requires only a few minutes for determinations at levels as low as 100 micrograms oxygen demand per liter. Results of tests on solutions of known organic compounds, an industrial waste stream, a domestic sewage plant effluent, and a natural stream show that the method compares favorably with the dichromate reflux procedure recommended by APHA. However, the new method is considerably faster and easier to use, and is a hundred times more sensitive. An analytical system which is suitable for use as either a continuous COD monitor or as an analyzer for multiple samples in series is also described. (Holoman-Battelle)

THERMAL REMOTE SENSING ON THE MISSISSIPPI RIVER IN IOWA,
Geological Survey, Iowa City, Iowa.
S. J. Tuthill, J. V. Taranik, and B. E. Hoyer.
In: Water-1972, AIChE Symposium Series No 129, Vol 69, p 391-400 1973. 10 fig, 2 tab, 1 ref.

Descriptors: *Water temperature, *Remote sensing, *Mississippi River, River systems, Surface waters, Automation, *Thermal pollution, Telemetry, Aerial photography, Water pollution effects, Air temperature, Isotherms, Humidity, Wind velocity, Distribution, Data collections, Calibrations, Density, *Iowa.
Identifiers: *Thermal mapping, *Thermal infrared imagery, Accuracy, Isothermal maps, Isodensitracing, Thermal line scanner, Radiometers, Wind direction, Radiant energy, Ground truth data, Thermal imaging.

On 4 June, 1971, the Iowa Conservation Commission, Commonwealth Edison, and the Iowa Geological Survey studied the surface temperature distribution of the Mississippi River bordering Iowa. Airborne thermal mapping data were collected along a 180-mile length of river concurrent with surface measurements at 13 preselected areas. Density slicing the thermal imagery provided a method for generating an isothermal map. Results indicate further refinement of thermal mapping techniques could rapidly produce accurate thermal maps for complete river systems. (Holoman-Battelle)

ATOMIC ABSORPTION ANALYSIS OF STRONG HEAVY METAL CHELATING AGENTS IN WATER AND WASTE WATER,
Missouri Univ., Columbia. Dept. of Chemistry.
R. Kunkel, and S. E. Manahan.
Analytical Chemistry, Vol 45, No 8, p 1465-1468, July 1973. 4 fig, 2 tab, 6 ref.

Descriptors: *Heavy metals, Waste water (Pollution), *Pollutant identification, *Chemical analysis, *Methodology, Water analysis, Nitrilotriacetic acid, Water pollution, Chelation, Water pollution effects, Pollutants, Sewage effluents, Copper, Potable water, Activated sludge, Brines.
Identifiers: *Chelating agents, *Atomic absorption spectrophotometry, Natural waters, Chemical recovery, EDTA, Metal chelates, Ionic interference, Pollutant effects, Solubilization, Metal complexes, Chemical interference, Ammonium.

A method for the analysis of total strong heavy metal chelating agents in water is described. The method is based upon the solubilization of copper by the chelating agents at pH 10 followed by filtration and atomic absorption analysis of soluble copper in the filtrate. The analysis gives total levels of strong chelating agents, a significant parameter insofar as the properties of natural waters and waste waters are concerned. The method is simple, sensitive, and relatively free of interferences. It can be applied to the analysis of individual chelating agents after separation. (Holoman-Battelle)

Identifiers: Data interpretation, Metals industry, Grease, Volatile solids, Tin, Lubricating oils, Sulfuric acid, Hydrochloric acid, Iron Sulfate, Iron chloride, Cyanides.

Estimating industrial water pollution requires information on present levels of pollution and behavioral factors likely to bring about changes in the future. A model covering 26 pollution parameters was calibrated from readily available data for 2,026 plants in the New York region. The simulations produced a microspatial scale view of industrial pollution potential. Attempts to improve the model by collecting regional industrial surveys and questionnaires proved unrewarding because data remained incomplete and inconsistent with respect to location and timing of samples. The potential impact of federal regulations and technological changes on industrial effluent generation will be influenced largely by the organizational structures governing the abatement program. THE MAYFLY (EPHEMEROPTERA) IN TROUT STREAMS OF THE BESKIDS. II. PRODUCTION, DIE EINTAGSFLIEGEN (EPHEMEROPTA) IN FORELLENBACHEN DER BESKIDEN. II. PRODUKTION),
Brno Univ. (Czechoslovakia). Zoological Inst.
M. Zelinka.
Hydrobiologia, Vol 42, No 1, p 13-19, July 6, 1973. 5 tab, 6 ref.

Descriptors: *Mayflies, *Secondary productivity, *Water quality, *Biomass, *Animal populations, Streams, Water temperature, Hydrogen ion concentration, Acidity, Alkalinity, Hardness (Water), Calcium, Magnesium, Dissolved oxygen, Ammonia, Nitrates, Nitrites, Phosphates.
Identifiers: Baetis rhodani, Rhithrogena semicolorata, Ecdyonurus, *Czechoslovakia.

The first part of this study (1969) dealt with the abundance and biomass of mayflies (Ephemeroptera). On the basis of the measurement of length of all mayflies and of the determination of the respective weight (according to the curve expressing the relation length weight) the production for each month was calculated. The annual average for Baetis rhodani amounted to 5.317 g/sq m, for Rhithrogena semicolorata 12.478 and for the species belonging to the genus Ecdyonurus 8.47 g/sq m. The relation between the annual production and average annual biomass was nearly the same in all three species equal to 1:8.37. These three taxa formed 76 percent of the biomass. After addition of the remaining taxa of mayflies the production of Ephemeroptera in the two brooks under investigation totalled 27, 152 g/sq m equal to 271,52 kg/ha per year. Water quality characteristics are tabulated for the streams. (Little-Battelle)

RAPID, SELECTIVE METHOD FOR LEAD BY FORCED-FLOW LIQUID CHROMATOGRAPHY,
Ames Lab., Iowa.
M. D. Seymour, and J. S. Fritz.
Analytical Chemistry, Vol 45, No 9, p 1632-1636, August 1973. 6 fig, 1 tab, 10 ref.

Descriptors: *Lead, *Separation techniques, *Aqueous solutions, *Pollutant identification, Heavy metals, *Anion exchange, Chemical analysis, Methodology, Selectivity, Ions, Nitrates, Molybdenum, *Chromatography.
Identifiers: Forced-flow liquid chromatography, Environmental samples, Accuracy, Precision, Chemical interference, Ionic interference, Rhodium, Antimony, Sample preparation, Rare earth elements.

A forced-flow ion exchange method for the separation of lead from metal ions has been described. Lead is measured in a manner similar to that described previously for iron. Lead (II) is retained on a small anion exchange column from 0.5 M hydrochloric acid and separated from many other metal ions. Then it is eluted with 8 M hydrochloric acid and the elution curve is recorded at 270 nm. The amount of lead is obtained from a plot of elution peak height vs. micrograms of lead. The entire separation sequence required only 8 min. There are two kinds of interference common to this type of analysis. Column overloading can cause alteration of peak shape and retention time and, hence, a dependency of peak height on matrix composition. The other type of interference is due to ions that are retained in 0.5 M HCl, stripped in 8.0 M HCl and absorbed at 270 nm. Of the cations tested, only three were found to interfere. Rhodium (III), antimony (V), and molybdenum (VI) were found to cause a 1 percent error in the analysis with metal/lead ratios of 0.009, 0.181, and 5.30, respectively. Nitrate ion can also cause error and should be driven off by taking the sample to dryness in concentrated hydrochloric acid prior to analysis. Several standard samples have been successfully analyzed for lead. (Holoman-Battelle)

DIRECT DETERMINATION OF PHOSPHORUS BY ATOMIC ABSORPTION FLAME SPECTROMETRY,
Imperial Coll. of Science and Technology, London (England). Dept. of Chemistry.
G. F. Kirkbright, and M. Marshall.
Analytical Chemistry, Vol 45, No 9, p 1610-1613, August 1973. 1 fig, 3 tab, 13 ref.

Descriptors: *Phosphorus, *Pollutant identification, *Aqueous solutions, *Chemical analysis, Methodology, Nutrients.

Identifiers: *Atomic absorption spectrophotometry, Detection limits, Chemical interference, Yeast extract, Sensitivity, Accuracy, Molybdenum blue method, Beef extract, Biological samples, Milk products.

The direct determination of phosphorus by atomic absorption spectrometry at its 177.5-, 178.3-, and 178.8-nm resonance lines using a nitrogen-separated nitrous oxide-acetylene flame and a microwave-excited phosphorus electrodeless discharge lamp source is described. Phosphorus may be determined in aqueous solution as o-phosphate with a sensitivity of 4.8 and 5.4 micrograms/ml (for 1 percent absorption) at the 177.5- and 178.3-nm lines; the corresponding detection limits obtained at these wavelengths were 29 and 21 micrograms/ml, respectively. The high temperature and relatively transparent nature of the fuel-rich flame make it a convenient atom cell for the atomization of phosphorus; no significant chemical or physical interferences have been observed at the levels investigated. The results of a preliminary investigation of the application of the method to the direct determination of phosphorus in milk powder and yeast and beef extracts are described. (Holoman-Battelle)

DETERMINATION OF AMMONIA IN AQUARIA AND IN SEA WATER USING THE AMMONIA ELECTRODE,
New England Aquarium, Boston, Mass.
T. R. Gilbert, and A. M. Clay.
Analytical Chemistry, Vol 45, No 9, p 1757-1759, August 1973. 1 fig, 3 tab, 7 ref.

Descriptors: *Ammonia, *Water analysis, *Sea water, *Aquaria, *Pollutant identification, Chemical analysis, Aqueous solutions, Pollutants, On-site tests, On-site investigations, Water quality, Water pollution, *Electrodes.
Identifiers: Ammonia electrodes, Ion selective electrodes, Precision, Reproducibility, Accuracy.

An ammonia electrode that has been fabricated for the analysis of ammonia in aqueous solutions consists of a hydrophobic gas-permeable membrane which separates the alkaline test solution from an internal solution 0.1 M in ammonium chloride. When the electrode is immersed in an alkaline test solution, ammonia can diffuse across the membrane, alter the NH3 concentration in the filling solution, and so cause a pH change which is monitored by the glass electrode. Electrode reproducibility was evaluated using samples from different marine life display tanks at the New England Aquarium with varying ammonia levels. The results indicate that the relative precision of these analyses was fairly constant over a wide concentration range. To test the accuracy of the method and to evaluate the electrode/portable unit as a tool for on-site analysis, a series of 1-liter samples of Boston Harbor water was collected. A Dorchester Bay sample was analyzed on site using the standard procedure described above with a battery powered magnetic stirring motor. With the meter in a horizontal position to minimize needle oscillation due to rocking of the boat, six analyses of the sample gave a mean value of 92 ppb NH3-N with a standard deviation of 3 ppb. Other samples were acidified to pH 3-4 with 6 M HCl to stabilize the ammonia and analyzed the same day in the laboratory by the electrode and also by the phenol-hypochlorite method. The data indicate that the electrode provides an accurate means of analyzing ammonia in sea water and that it is usually more precise than the spectrophotometric method. Furthermore, the performance of the electrode in the field is comparable to that observed in the laboratory, showing the technique to be well suited for field analysis. (Holoman-Battelle)

1-EPHEDRINE IN CHLOROFORM AS A SOLVENT FOR SILVER DIETHYLDITHIOCARBAMATE IN THE DETERMINATION OF ARSENIC,
National Environmental Research Center, Cincinnati, Ohio.
J. F. Kopp.
Analytical Chemistry, Vol 45, No 9, p 1786-1787, August 1973. 1 fig, 2 tab, 2 ref.

Descriptors: *Colorimetry, *Solvents, *Water analysis, Rivers, Sewage effluents, Waste water (Pollution), Odor, Absorption, Spectrophotometry.
Identifiers: *Arsenic, Sample preparation, Chemical interference, Accuracy, Acid digestion, Organic solvents.

1-EPHEDRINE IN CHLOROFORM WAS SUBSTITUTED FOR PYRIDINE AS A SOLVENT FOR SILVER DIETHYLDITHIOCARBAMATE IN THE COLORIMETRIC DETERMINATION OF ARSENIC IN WATER. This eliminates the objectionable odor associated with pyridine. Samples of river water, sewage effluent, and distilled water were analyzed by both procedures and the results compared. 1-ephedrine in chloroform gave an accuracy within the acceptable range. Cr, Co, Cu, Hg, Ni, Pt, and Sb may interfere with the method. However, levels normally encountered do not cause significant interference. As with the pyridine method, organically bound arsenic cannot be determined without an acid digestion step. (Little-Battelle)

ULTRAPURIFICATION OF WATER FOR ELECTROCHEMICAL AND SURFACE CHEMICAL WORK BY CATALYTIC PYRODISTILLATION,
Ottawa Univ. (Ontario). Dept. of Chemistry.
B. E. Conway, H. Angerstein-Kozlowska, W. B. A. Sharp, and E. E. Criddle.
Analytical Chemistry, Vol 45, No 8, p 1331-1336, July 1973. 7 fig, 27 ref.

Descriptors: *Water purification, Organic matter, Optical properties, Water, Water analysis, *Electrochemistry.
Identifiers: *Ultrapure water, *Catalytic Pyrodistillation, Ion selective electrodes.

Recently, domestic and industrial water supplies have become contaminated by organic impurities that cannot be removed by ordinary or oxidative distillation because of steam volatility of the impurities of their derivatives. The results of using a pyrocatalytic distillation system for preparation of ultrapure water for electrochemical and surface chemical work are described. Exacting electrochemical and optical criteria are defined for judging and characterizing the purity of water, with respect to organic impurities, especially with regard to their effects at Pt and Hg electrodes. K. Bhatia.
Analytical Chemistry, Vol 45, No 8, p 1344-1347, July 1973. 3 fig, 1 tab, 8 ref.

Descriptors: *Phenols, *Pollutant identification, Waste water (Pollution), Water analysis, *Aqueous solutions, Industrial wastes, Solvents, *Chromatography.
Identifiers: *Liquid chromatography, *Chemical interference, Detection limits, Phenolic terphenyls, Beta-naphthol, Alpha-naphthol, Sensitivity, Aromatic hydrocarbons, Organic solvents, Benzene, Bromobenzene, Pyridine, Aniline, Bromophenols, Chlorinated hydrocarbons, Chlorphenols, Catchol, Resorcinol, Hydroquinone, Quinone, Trihydroxybenzenes, Aminophenols, Biphenyls, Phenylphenol, Indoles.

Liquid chromatographic methods capable of use both for identification of trace quantities of phenols in aqueous solution and for the quantitative analysis of mixtures whose components are known are described. An optical detector utilizing the 254-nm mercury resonance line was used. Phenol in the aqueous phase can be accurately determined down to 0.00001 M (less than mg/l). Further improvement in the sensitivity of the method for quantitative analysis of phenol can be achieved by using larger samples and a detector operating at about 270 nm. The presence of di- and trihydroxybenzenes, most other substituted phenols, naphthols, and phenolic bi- and terphenyls in the solutions does not interfere in the determination of phenol. The application of aqueous liquid chromatography to the determination of phenols in industrial waste waters is demonstrated. The methods can be easily extended to the determination of individual substituted phenols down to at least 0.00001 M. (Little-Battelle)
W73-14303

CORRELATION OF ENHANCEMENT OF ATOMIC ABSORPTION SENSITIVITY FOR SELECTED METAL IONS WITH PHYSICAL PROPERTIES OF ORGANIC SOLVENTS,
Murray State Univ., Ky. Dept. of Chemistry.
A. J. Lemonds, and B. E. McClellan.
Analytical Chemistry, Vol 45, No 8, p 1455-1460, July 1973. 6 fig, 3 tab, 20 ref.

Descriptors: *Heavy metals, Cadmium, Nickel, Cobalt, Zinc, Solvents, Aqueous solutions, *Spectrophotometry, Alcohols.
Identifiers: *Atomic absorption spectrophotometry, *Organic solvents, Signal enhancement, Esters, Silver, Sensitivity, Ketones.

Various alcohols, ketones, esters, and other organic compounds, as solvents for Ag, Cd, Co, Ni, and Zn ions, were studied to determine the enhancement of atomic absorption values for each metal-solvent system and to correlate the enhancement values with the physical properties of the solvents. Optimum instrumental conditions were determined for each metal-solvent system employing two different burner-aspirator systems. Absorbance values for the metal-organic solvent systems were measured and compared with the absorbance values for the aqueous system of the same concentration in order to calculate an enhancement value. Plots of enhancement vs. log viscosity and enhancement vs. log boiling point for

each ion resulted in lines with negative slopes. Various plots involving density and surface tension showed little or no dependence of enhancement on either of the constants. However, a linear relationship existed between log (viscosity X boiling point) and enhancement. (Little-Battelle)

Descriptors: *Sampling, *Mathematical studies, Water pollution, Equations, Biological communities, Computer programs, Bioindicators, Water quality, Statistical methods, *Louisiana.
Identifiers: *Data interpretation, Artificial substrates, Species diversity, Anacoco Bayou, *Sabine River, Biological indexes, Rock baskets, Multiplate samplers.

Aquatic organisms were collected from the area surrounding the confluence of Anacoco Bayou and the Sabine River, Louisiana, in an attempt to develop a single biological index useful in evaluating water quality. A secondary objective was to compare artificial substrate samplers: rock-filled baskets and multiplate samplers. Samplers were retrieved after 4 weeks, and the organisms harvested by scrubbing, identified, and counted. An equation based on information theory was developed to process the data. Computer programs were written to do the calculations as well as the analysis of variance. It is concluded that the method can objectively reduce several biological indexes to a single meaningful value. Resulting sets of standardized distance values can be compared subjectively or can be subjected to statistical evaluation and probability levels of differences assessed. There was no indication of differences between samplers or interaction between samplers and site. (Little-Battelle)

PROTEINS IN WASTEWATER AND WASTEWATER SLUDGES,
Indian Inst. of Science, Bangalore. Dept. of Biochemistry.
M. K. C. Sridhar, and S. C. Pillai.
Journal Water Pollution Control Federation, Vol 45, No 7, p 1595-1600, July 1973. 1 fig, 2 tab, 32 ref.

Descriptors: Waste water (Pollution), *Activated sludge, Septic tanks, *Proteins, *Sewage bacteria, *Sewage sludge, *Protozoa, *Pollutant identification, Solubility, Nitrogen, Amino acids, Solvent extractions, Biomass, Water, Sodium chloride.
Identifiers: Organic solvents, Inorganic solvents, Epistylis articulata, Albumins, Globulins, Glutelins, Prolamins, Ciliates, Bacterial populations, Sodium hydroxide, Acetic acid, Ethanol.

The proteins found in raw wastewater, septic tank sludge, activated sludge, the mixed bacteria from activated sludge, the dominant protozoan Epistylis articulata in activated sludge, and the bacteria associated with the protozoan were identified on the basis of their solubilities in several solvents. On an equal dry-weight basis, these materials contained about 11, 17, 43, 73, 60, and 78 percent total proteins, respectively. Qualitatively, there were striking similarities between raw wastewater and septic tank sludge, between activated sludge and the protozoan, and between the two bacterial preparations in the distribution of the different protein fractions (albumins, globulins, glutelins, and prolamins). These observations seem to be of considerable significance in the study of the microbiology of wastewater and sludges and their protein contents. (Holoman-Battelle)

echniques are discussed for the measurement of rganic wastewater parameters including BOD, otal carbon, total organic carbon, total oxygen deand, and COD. The analytical instruments are (1) ontinuous monitoring and (2) intermittent samling instruments which include automated GLC, mass spectrometer, digital computer prorammed gas chromatograph-mass spectrometers, nd infrared spectrometry. Only a limited number f organic parameters, however, can be measured n a continuous basis. Also only a few instruments re available for monitoring the organic content of vater, and these give measurements only of total rganic carbon content. The drawback for control urposes would seem to be an inability to specify rganic constitutents and demonstrate a toxicity ffect of a wastewater. (Holoman-Battelle)

PRACTICAL EXPERIENCE OF THE WATER RESOURCES DIVISION IN THE USE OF MULTIPARAMETER ELECTRONIC RECORDERS AND AUTOMATED TECHNIQUES FOR MONITORING WATER QUALITY IN STREAMS,
Geological Survey, Washington, D.C. Water Resources Div.
R. J. Pickering.
In: Water-1972, AIChE Symposium Series No. 129, Vol 69, p 603-606. 1973. 3 ref.

Descriptors: *Monitoring, *Water quality, *Automation, *Electronic equipment, Water analysis, Data transmission, Methodology, Data collections, Water properties, Water temperature, Specific conductivity, Dissolved oxygen, Hydrogen ion concentration, Turbidity, Ammonia, Nitrates, Nitrites, Phosphates, Streams, Flow rates, Telemetry, Maintenance, Streamflow, Pumps.
Identifiers: *Recorders.

The stream monitoring practices of the U. S. Geological Survey are reported along with the difficulties experienced in using field monitoring equipment. The parameters measured are: specific conductance, temperature, dissolved oxygen, pH, turbidity, ammonia, nitrate, nitrite, and hydrolyzable phosphates. The first five parameters are electronically monitored; the last four are monitored by wet chemistry techniques. A bubbler method is used for stream flow measurements. The wet chemistry analyzers require the most attention. Telemetering of data involves the collection of measurements taken at several sampling sites. The recorders are digital to make telemetering simpler. Perhaps in the future such data can be collected and transmitted by satellite to a centrally located ground acquisitioning site for computer management. (Little-Battelle)

REMOTE SENSING OF WATER QUALITY: A STATE OF THE ART REPORT,
Florida Univ., Gainesville. Dept. of Environmental Engineering Sciences.
W. J. Mitsch.
Available from the National Technical Information Service as PB-223 503, $2.75 in paper copy, $1.45 in microfiche. Florida Water Resources Research Center Publication No. 21, 1973. 14 p, 9 fig, 43 ref. OWRR A-999-FLA (5). 14-31-0001-3809.

Descriptors: *Remote sensing, Photogrammetry, *Water quality, Reviews, Natural resources, *Satellites (Artificial), *Pollutant identification.
Identifiers: Infrared scanning, Multispectral scanning, *Earth resources satellite.

Remote sensing, or the carrying out of aerial or space surveys of the earth's surface, is finding several applications in the fields of water quality and water resource management. It offers a means of obtaining large amounts of data, but its value is in the expansion of data in the spatial, temporal and spectral modes. The most valuable techniques presently are photography, infrared scanning and multispectral scanning. Aircraft applications include the measuring of the distribution of various waste discharges into water bodies and the study of aquatic plant growth and benthic communities. The ERTS (Earth Resources Technology Satellite) program of the U. S. Department of the Interior is investigating satellite applications of monitoring the earth's resources. The water resource applications are less obvious than those of the aircraft and concern environmental indicators on a much larger scale. However, the satellite offers the enhancement of data in the temporal mode with periodic remote sensing of most of the earth's surface. (Morgan-Florida)

LOW LEVEL BOD DETERMINATIONS BY THE ELECTROLYSIS METHOD,
Iowa State Univ., Ames.
J. A. Merideth.
Master's Thesis, 1969, 155 p, 18 fig, 12 tab, 38 ref.

Descriptors: *Biochemical oxygen demand, *Electrolysis, *Laboratory tests, Instrumentation, Nitrification, Nutrients, Time lag, Statistical methods, Water analysis, Water quality control, *Waste water treatment, Analytical techniques.
Identifiers: *Dilution method, *Seed concentration, Standard deviations.

Low strength synthetic substrates and actual stream samples were analyzed using the Standard Method's BOD test and by electrolysis, to determine the adaptability of the electrolysis technique to low level BOD waters and compare the results obtained to those obtained with the standard test. Conclusions drawn from inital testing included: (1) seed concentration has a definite effect on both K and L values since it effects lag times; (2) nitrification should either be inhibited or accounted for in BOD determinations; (3) addition of nutrients to low BOD stream water produced little or no effect on the BOD determination; (4) CO2 adsorption during electrolysis did not inhibit oxygen demand

exertion; (5) deviations of from 3.5 to 6% of the average 5day BOD values were obtained by electrolysis. In comparing the two methods it was found that: (1) both methods require the same time for one reading, but if daily readings are to be taken the electrolysis method is much more efficient; (2) the electrolysis method was demonstrated to be at least equal, if not superior, to the dilution method for accuracy of results; and (3) the lower the BOD value of the sample, the more difficult it will be to obtain close agreement of values for either method. DIRECT VAPORIZATION AND QUANTIFICATION OF ARSENIC FROM SOILS AND WATER,
Texas A and M Univ., College Station. Dept. of Agricultural Analytical Services; and Texas A and M Univ., College Station. Dept. of Soil and Crop Sciences.
J. R. Melton, W. L. Hoover, J. L. Ayers, and P. A. Howard.
Soil Science Society of America Proceedings, Vol 37, No 4, p 558-561, July-August 1973. 3 fig, 3 tab, 9 ref.

Descriptors: *Arsenic compounds, *Chemical analysis, *Spectrophotometry, *Flame photometry, Soil chemistry, Water chemistry, Water analysis.
Identifiers: *Arsine.

A procedure is described for the determination of arsenic in soils at the parts per million level and water at the parts per billion level. Determinations are made by direct introduction of arsine gas into the flame of an atomic absorption spectrophotometer. An easily constructed apparatus is described for introducing arsine into the flame. Soils from various states, as well as water samples from Texas waterways, are studied for arsenic content. Recoveries of arsenic added to soils and water samples ranged from 93.0% to 106.0%. (Knapp-USGS)

SIMPLE ARRANGEMENT FOR THE DETECTION OF SULPHUR IN GAS-CHROMATOGRAPHIC ELUATES, (EINFACHE ANORDNUNG ZUM NACHIWEIS VON SCHWEFEL IN GAS-CHROMATOGRAPHISCHEN ELUATEN),
Universitaet des Saarlandes, Saarbruechen (West Germany). Institut fuer Analytische Chemie und Radiochemie.
E. Blasius, and H. Lohde.
Zeitschrift fur Analytische Chemie, Vol 264, No 4, p 286-289, May 7, 1973. 3 fig, 1 tab, 11 ref.

Descriptors: *Gas chromatography, *Sulfur, *Pollutant identification, Laboratory equipment.
Identifiers: *Detection limits, Sample preparation.

The described apparatus for the detection of sulphur in gas-chromatographic eluates is based on the hydrogenation of compounds of sulphur to H2S and its detection with a thin-layer plate containing Pb (CH3COO)2. The Pbs zones obtained can be evaluated optically, too, by measurement of the degree of remission. The limit of detection is 5 ng of sulphur (as CS2). Sixteen sulphur compounds can be detected in the pyrograms of a strong acid cation-exchanger. (Little-Battelle)

THE SPECTROPHOTOMETRIC DETERMINATION OF PALLADIUM WITH 4- ((5-CHLORO--2-PYRIDYL)AZO)-1,3-DIAMINOBENZENE,
Government Industrial Research Inst., Nagoya (Japan).
S. Shibata, Y. Ishiguro, and R. Nakashima.
Analytica Chimica Acta, Vol 64, No 2, p 305-309, April 1973. 4 fig, 2 tab, 5 ref.

Descriptors: *Water analysis, *Spectrophotometry, *Aqueous solutions, Heavy metals, Calibrations, Pollutant identification, Absorption.
Identifiers: *Palladium, Sample preparation, Sensitivity, Chemical interference, Calibration curves.

Using 4- ((5-chloro-2-pyridyl)azo)-1,3-diaminobenzene (5-Cl-PADAB) as the reagent, microgram amounts of palladium can be determined by spectrophotometry. The recommended procedure is as follows. To a 25-ml volumetric flask, transfer a suitable aliquot of acidic sample solution containing up to 25 micrograms of palladium, and add 0.5 ml of ethanolic 0.08 percent reagent solution. Then add 5 ml of (1 plus 1) hydrochloric acid solution, dilute to volume and mix well. Measure the absorbance of the palladium complex produced at 572 nm against a reagent blank. Obtain the concentration of palladium from a standard calibration curve obtained under identical conditions. The calibration curve proved to be linear up to 1 ppm Pd. Interference tests showed that Al, Be, Bi, Cd, rare earths, Mg, Ca, Mn, Pb, Th, Ti, U, Zn, Zr in 5 mg amounts, V, W, Ni, Cr, in 1-2 mg amounts, and 0.5 mg of Co did not interfere. Five-fold amounts of iron (III) and two-fold amounts of copper did not interfere. Interference was caused only by chromium (VI). Common anions such as chloride, nitrate, acetate, sulfate and perchlorate did not interfere. Strong oxidizing agents interfered. (Little-Battelle)

ATOMIC ABSORPTION AND FLUORESCENCE SPECTROMETRY WITH A CARBON FILAMENT ATOM RESERVOIR. PART XIII. THE DETERMINATION OF CHROMIUM WITH A FULLY ENCLOSED ATOM RESERVOIR,
Imperial Coll. of Science and Technology, London (England). Dept. of Chemistry.
K. W. Jackson, T. S. West, and L. Balchin.
Analytica Chimica Acta, Vol 64, No 3, p 363-369, May 1973. 3 fig, 1 tab, 11 ref.

Descriptors: *Chromium, Heavy metals, Laboratory equipment, Aqueous solutions, *Water analysis, *Spectrophotometry.
Identifiers: *Chemical interference, *Atomic absorption spectrophotometry, Sensitivity, Detection limits, Atom reservoir.

The detection and measurement of chromium by atomic absorption spectrometry with a carbon filament atom reservoir is described. At a wavelength of 357.9 nm, a sensitivity (1 percent absorption) of 9.2 X 10 to the minus 12 power g was obtained. The detection limit was 10 to the minus 11 power g; in terms of concentration this is similar to that normally detectable in a flame. Interferences resulting from the presence of various levels of Sr, Fe (III), Co (II), Cu (II), Ca, Ba, Al, Sn (II), Sb, RB, Ti (IV), Pb, Mn (II, Zn, Hg (II), and V (V) were determined. (Little-Battelle)

THE FLUORIMETRIC DETERMINATION OF MERCURY,
Dalhousie Univ., Halifax (Nova Scotia). Trace Analysis Research Centre.
J. Holzbecher, and D. E. Ryan.
Analytica Chimica Acta, Vol 64, No 3, p 333-336, May 1973. 2 fig, 3 ref.

Descriptors: *Water analysis, *Mercury, *Fluorometry, Aqueous solutions, Heavy metals, Fluorescence, Calibrations.
Identifiers: *Sample preparation, Precision, Chemical interference, Detection limits, Organomercury compounds, Calibration curves.

The use of thiamine for the fluorometric determination of mercury is described. Stock solutions for analysis were prepared from mercury (II) chloride. The analytical procedure involved adding several milliliters of approximately neutral unknown solution (10-500 ng Hg per ml) and thiamine reagent to a borate buffer and making up to volume with twice-distilled water. It is important that the resulting solution contain less than 0.02 M foreign salts. The fluorescence intensity is measured at 440 nm after 1 hr or more, the excitation wavelength is 375 nm. Mercury must be present in the divalent state since Hg (I) gives a fluorescent intensity about half that of Hg (II). Organomercury compounds can only be analyzed after destruction of organic matter by acid digestion and conversion to inorganic Hg (II). Mercury (II) was successfully determined in the presence of a 10,000-fold (molar) amount of nickel (II), cobalt (II) or zinc (II); a 1000-fold amount of copper (II), cadmium (II), manganese (II) or aluminum (III); or a 100-fold amount of iron (II) or iron (III). Similarly, 100,000-fold amounts of the sodium or potassium salts of acetate, chloride, citrate, sulfate or tartrate did not interfere. A 10,000-fold amount of fluoride, nitrate, perchlorate or phosphate, and a 1000-fold amount of bromide and thiocyanate could be tolerated; the fluorescence was quenched by equivalent amounts of cyanide, iodide, sulphide or EDTA. Tap water samples spiked with mercury (II) chloride were anlyzed by this procedure with a relative error of determination of less than 5 percent. (Little-Battelle)

ISOLATION AND PROPERTIES OF RIBONUCLEASE-DEFICIENT MUTANT OF SALMONELLA TYPHIMURIUM,
California Univ., Davis. Dept. of Bacteriology.
C. T. Wehr.
Journal of Bacteriology, Vol 114, No 1, p 96-102, April 1973. 5 tab, 33 ref.

Descriptors: *Enzymes, *Separation techniques, *Growth rates, Cultures, Salmonella, *Isolation.
Identifiers: *Salmonella typhimurium, Mutants.

A mutant of Salmonella typhimurium has been isolated that has less than 5 percent of the ribonuclease activity of the parent strain. Mutant screening and enzyme assays were done in the presence of ethylenediaminetetraacetic acid, a substance that activates ribonuclease I and inhibits other known microbial nucleases. The enzyme may perform a scavenge function in the utilization of exogenous ribonucleic acid. Loss of this enzyme seems to have no detrimental effects on the growth of Salmonella. (Little-Battelle)

V METHOD FOR EVALUATION OF DIS- VED OXYGEN PROBE RESPONSE FOR K L A DETERMINATION,
fornia Univ., Berkeley. Lawrence Berkeley

C. Wernau, and C. R. Wilke.
technology and Bioengineering, Vol 15, No 3, 1-578, May 1973. 3 fig, 15 ref.

criptors: Evaluation, *Methodology, Labora- equipment, Automation, Equations, Perm- ctive membranes, Dissolved oxygen, Re- ance, Instrumentation.
ntifiers: *Mass transfer coefficients, *Volu- ric liquid phase, *Dissolved oxygen probes, ope method, Response time, Slope (Mathe- ics), Accuracy.

Previously adopted methods for the measurement of the volumetric liquid phase mass transfer coefficient, K sub L a, in various liquid systems using dissolved oxygen probes have been problematic. The problems ranged from inability to define time in reference to step changes to the necessity of having very thin, highly permeable membranes in order to get accurate results. In order to alleviate such problems, a new method (the slope method) for finding K sub L a based on the transient response of dissolved oxygen probes was devised. Since the origin of time (time of the step change) is so poorly defined in actual experimental situations, measurement of the slope of the response curve (d (Et/Eo)/dt) would appear to be dependent upon the accurate estimation of the time of the step change. This problem is alleviated by taking the slope at its maximum value. This procedure is illustrated diagramatically. This method is independent of the time of the step change and is applicable for slow probes at K sub L a values from approximately 20/hr to values in excess of 500/hr. The method is least accurate at high K sub L a values, where the sensitivity of the slope to beta is considerably reduced. It is recommended that the method of Linek be used at K sub L a values below 20/hr and that faster probes than that used in this study be employed for K sub L a values above 500/hr. A PHOTON COUNTING DEVICE FOR THE MEASUREMENT OF NANOSECOND AND MICROSECOND KINETICS OF LIGHT EMISSION FROM BIOLOGICAL SYSTEMS,
MSU-AEC Plant Research Lab., East Lansing, Mich.
H. C. Beall, and A. Haug.
Analytical Biochemistry, Vol 53, No 1, p 98-107, May 1973. 2 fig, 18 ref.

Descriptors: *Photosynthesis, *Instrumentation, *Biochemistry, Scenedesmus, Laboratory equipment, Electronic equipment, Bioassay, Bioluminescence.
Identifiers: *Scenedesmus obliquus, *Photon counting, *Light emission, Lasers, Photomultipliers, Analog to digital converters.

Instrumentation and operation are described of a photon counting system which was constructed to measure the delayed light emission from the alga Scenedesmus obliquus. The study of the kinetics of the delayed light emission, especially the fast kinetics of the nanosecond and microsecond regions, should produce evidence concerning the mechanism involved in the early photochemical and biochemical steps of photosynthesis. The functioning of the system was illustrated by a plot which compared data of the recorded delayed light emission with data of the system noise over the first 20-microsecond interval after extinction of a modulated laser beam. The utility of photon counting as a satisfactory method of measuring biological light emission, especially a very rapid process such as the delayed light emission from photosynthetic organisms is illustrated. DETERMINATION OF ALUMINIUM BY ATOMIC ABSORPTION SPECTROPHOTOMETRY AFTER CHELATION WITH OXINE AND EXTRACTION WITH METHYL ISOBUTYL KETONE,
Commonwealth Scientific and Industrial Research Organization, Adelaide (Australia). Div. of Soils.
B. H. Smith.
Laboratory Practice, Vol 22, No 2, p 100-102, February 1973. 5 fig, 7 ref.

Descriptors: *Aqueous solutions, *Aluminum, *Separation techniques, *Chelation, Water analysis, Iron, Fluorides, Phosphates, *Spectrophotometry.
Identifiers: *Atomic absorption spectrophotometry, Sample preparation, Chemical interference, Sensitivity, Precision, Detection limits, Oxalates, Citrates, Pyrophosphates, Orthophosphates.

Solutions of aluminum were prepared from A12 (SO4)3 (NH4)2 SO4.12H20 made up in HC1. Aliquots containing 0 to 100 micrograms of A1 were prepared by dilution with distilled water to give concentrations of 2 to 20 ppm A1. The samples were prepared for AA analysis by chelation of the A1 with oxine and extraction with methyl isobutyl ketone. The chelation step had the effect of concentrating the A1, thereby extending the range of usefulness of the method, and eliminating a number of interferences. A N20/C2H2 flame was used in the AA analysis with absorption measured at 30927 angstroms. The sensitivity of the method was approximately 0.3 ppm A1 per 1 percent absorption with a detection limit of approximately 0.2 ppm. Precision ranged from 3-20 percent depending on concentration of A1. Interferences and methods for eliminating them were studied by adding Fe (III), oxalate, fluoride, citrate, pyrophosphate, and orthophosphate. (Little-Battelle)

ISOLATION OF SALMONELLAE FROM PORK CARCASSES,
Georgia Univ., Athens. Coll. of Veterinary Medicine.
J. A. Carpenter, J. G. Elliot, and A. E. Reynolds.
Applied Microbiology, Vol 25, No 5, p 731-734, May 1973. 3 tab, 26 ref.

Descriptors: *Pollutant identification, *Hogs, *Isolation, Enteric bacteria, Aerobic bacteria, Livestock, Mammals, Pollutants, Pathogenic bacteria, *Salmonella.
Identifiers: Salmonella derby, Salmonella anatum, Salmonella typhimurium, Salmonella indiana, Culturing techniques.

Four hundred and twenty pork carcasses from four abattoirs were examined for the presence of salmonellae by use of swabbing-enrichment techniques and contact plate methods. Carcasses from only one abattoir were found to be contaminated by swabbing-enrichment (23.3 percent) and contact plate (17.9 percent) methods. The area of the skin side of the ham, near the anal opening, was determined to be the area to examine for isolating salmonellae from pork carcasses with the greatest frequency. The most frequently isolated species of salmonellae in this study were Salmonella derby, S. anatum, S. typhimurium, and S. indiana. (Holoman-Battelle)

ABOLITION OF SWARMING OF PROTEUS BY P-NITROPHENYL GLYCERIN: APPLICATION TO BLOOD AGAR MEDIA,
Iowa State Univ., Ames. Dept. of Bacteriology.
F. D. Williams.
Applied Microbiology, Vol 25, No 5, p 751-754, May 1973. 2 tab, 5 ref.

Descriptors: *Inhibition, Inhibitors, Aerobic bacteria, Pathogenic bacteria, Cultures.
Identifiers: *Swarming, *Proteus, Culture media, Blood agar, p-Nitrophenyl glycerin, Plate counts, Comparative tests, Sodium azide, B-Phenylethanol, Bacterial physiology, Vibrio chloerae, Pseudomonas aeruginosa, Listeria monocytogenes, Klebsiella pneumoniae, Streptococcus pneumoniae, Streptococcus pyogenes, Staphylococcus aureus, Biochemical tests.

Comparative plate counts were made of Staphylococcus aureus and Streptococcus pyogenes growing on blood agar supplemented with individual chemicals to abolish the swarming of Proteus. B-phenylethanol, sodium azide, and p-

nitrophenyl glycerin (PNPG) were used as anti-swarm agents. Each anti-swarm agent effectively abolished swarming for 24 h, but azide failed to control swarming for longer periods of incubation. In addition, azide displayed growth inhibition towards the staphylococci and streptococci resulting in no hemolysis and reduced viable cell numbers with the streptococci. Phenylethanol showed reduced viable cell numbers with the streptococci and unreliable hemolytic reactions. At 0.1 to 0.3 mM, PNPG proved to be a superior anti-swarm agent in that it showed no growth inhibition and allowed normal hemolysis, but abolished swarming for extended periods of time. When laboratory strains of Streptococcus pneumoniae, Klebsiella pneumoniae, Pseudomonas aeruginosa, Listeria monocytogenes, and Vibrio cholerae were screened on a blood agar medium containing 0.1 mM PNPG they displayed similar growth and hemolytic characteristics to the identical medium without PNPG. (Holoman-Battelle)

A PRELIMINARY BASELINE STUDY OF ROBERTS AND STURGEON BANKS,
British Columbia Univ., Vancouver. Westwater Research Centre.
C. A. Bawden, W. A. Heath, and A. B. Norton.
Technical Report No. 1, March 1973. 54 p, 9 tab, 6 ref.

Descriptors: Environmental effects, *Mud flats, Animal populations, Wildlife, Pesticide residues, Sediments, Sampling, Deltas, Tidal marshes, Heavy metals, *Canada, *Baseline studies, *Aquatic population, *Data collections.
Identifiers: *Lower Fraser River (B.C.).

An extensive program covers biological, physical, and socio-economic aspects of the Lower Fraser River in British Columbia. Roberts and Sturgeon Banks are tidal flats in the Lower Fraser River delta. The purpose of the study was to determine the nature of the animal community of the Banks as of 1972. This included testing the larger animals for heavy metal and pesticide residues. Thirty-nine stations were sampled and 120 animals were tested. The data collected are presented on the type of species found, their relation to the grain size of sediment that they were found in, and their heavy metal and pesticide content. The study is intended to serve as a baseline for future studies of changes that may take place due to urban development and lower levels of water quality. It was found that the mudflats and estuarine area are not showing any signs of eutrophication. (Elfers-North Carolina)
W73-14486

A PRELIMINARY WATER QUALITY SURVEY OF THE LOWER FRASER RIVER SYSTEM,
British Columbia Univ., Vancouver. Westwater Research Centre.
A. H. Benedict, K. J. Hall, and F. A. Koch.
Technical Report No. 2. April 1973. 50 p, 2 fig, 9 tab, 1 append.

Descriptors: *Water quality, *Water analysis, *Data collections, Sampling, Sediments, Streamflow, *Canada.
Identifiers: *Lower Fraser River (B.C.).

The Lower Fraser River and tributaries comprising a drainage basin area of 78,300 square miles, covers most of the Interior Plateau of British Columbia. Spring floods from melting snows create the basin's runoff. The flat gradient of the river in the valley below the Coast Mountains results in water levels and discharge rates being affected by tides as far up as Chilliwack some 60 miles from the river mouth. The Lower Fraser is regarded at present as a clean stream but rapid development of the Province could seriously degrade its water quality. The report has three basic objectives: (1) to assemble and collate all available data on water quality in the river system from past studies; (2) to provide a broad overview of the existing water quality in the entire system; and (3) to begin to use these data to identify the best approach for developing a means to predict future water quality levels. Several tables of data collected include a summary of data prior to 1972, and various data collected in the summer of 1972 for both the Lower Fraser and several tributaries. Two key findings were that water quality in the tributaries is poorer than in the main stem and that there is no significant difference in quality between earlier data and the 1972 data. (Elfers-North Carolina)
W73-14487

ANALYSIS OF ORGANIC SALTS BY LASER IONIZATION MASS SPECTROMETRY: SULFONATES, SULFATES AND THIOSULFATES,
Pennsylvania State Univ., University Park. Dept. of Entomology.
R. O. Mumma, and F. J. Vastola.
Organic Mass Spectrometry, Vol 6, p 1373-1376, 1972. 1 tab, 7 ref.

Descriptors: *Chemical analysis, *Sulfates, *Sulfonates, *Mass spectrometry, Analytical techniques, Organic compounds, Water pollution sources, Pollutant identification, Sewage effluents, Detergents.
Identifiers: *Organic salts.

Sodium and potassium salts of organic sulfonates (1-decyl, 1-dodecyl and 1-hexadecyl), sulfates (1-hexyl, 1-decyl and 1-octadecyl) and thiosulfates (1-octyl, 1-dodecyl, 1-tetradecyl, 1-hexadecyl, benzyl and beta-phenylethyl) were ionized by laser irradiation and the positive ions were analyzed by time-of-flight mass spectrometry. The laser ionization mass spectra of the sodium salts of three alkyl sulfonates (1-decyl, 1-dodecyl and 1-hexadecyl) are tabulated. These salts, ranging in molecular weight from 244 to 328, produced simple intense spectra as did the 1-hexyl-sulfonates. The molecular species plus a cation (M+Na) is always the most intense ion in the spectra. Other organic ions are observed because of the dimers plus a cation. Inorganic ions (Na2SO3)+, (Na3SO3)+ and (Na3SO4)+) of low relative intensity are produced in approximately equal abundance. The spectra of sodium sulfates (1-hexyl and 1-decyl) and potassium 1-octadecyl sulfate are also presented. These spectra are more complex than the spectra of the sulfonates. A number of the sodium thiosulfate salts possessed ions containing potassium. The sodium salts were not cleanly prepared by ion exchange chromatography and possesed small amounts of potassium ions. Potassium is more easily ionized than sodium and therefore small amounts of potassium ions are easily observed in sodium salts. (Woodard-USGS)

RADIOCHEMICAL STUDIES ON EFFECT OF BATH: I. DETERMINATION OF MERCURY IN SPRING MUD BY NEUTRON ACTIVATION ANALYSIS (IN JAPANESE),
Kyushu Univ., Beppu (Japan). Inst. of Balneotherapeutical Research I.
H. Kawamura, and H. Kawakami.
J Hyg Chem, Vol 17, No 4, p 284-286, 1971, English summary.
Identifiers: Bath, Excretion, *Japan (Beppu spa), *Mercury, Mud, *Neutron activation analysis, Radiochemical analysis, Springs, Toxicosis.

Following radiochemical analysis of microamounts of mercury in hot spring water in 45 places in Beppu spa, mercury content in dried sludge and solution was determined by radiochemical analysis with Kon-ya S sludge. The content of mercury in the S sludge was 15.4 ppm in dried sludge and more than 14.6 microgram/liter of mercury is in liquid state in the natural hydrated sludge (liquation rate, 9.5%). This result indicates that mercury present is much greater than that in other soils or in spa water. (Copyright 1973, Biological Abstracts, Inc)

THE LIMNOLOGY OF TWO DISSIMILAR SUBARCTIC STREAMS AND IMPLICATIONS OF RESOURCE DEVELOPMENT,
Alaska Univ., College. Inst of Water Resources
J. D. LaPerriere, and D. Nyquist
Available from the National Technical Information Service as PB-223 353, $3.75 in paper copy, $1.45 in microfiche. Report No. IWR-33. March, 1973. 73 p, 21 fig, 10 tab, 3 append. OWRR B-017-ALAS (1).

Descriptors: Streams, *Nutrients, Physical properties, Chemical properties, *Benthos, Aquatic drift, *Dissolved oxygen, *Alaska, Subarctic, Mayflies, Coddisflies, Diptera, Biochemical oxygen demand, *Invertebrates.
Identifiers: Goldstream Creek (Alas), Chatanika River (Alas).

The Chatanika River and Goldstream Creek, two subarctic streams which lie in roughly parallel valleys in interior Alaska, but that differ in size of watershed, elevation, geomorphology and vegetation were studied over an eighteen month period. Both streams are currently free of human manipulation. Various chemical and physical parameters were measured approximately monthly for fourteen months at nine stations on the Chatanika River and five stations along Goldstream Creek. The benthic macroinvertebrate organisms were studied to elucidate relationships between selected parameters and their appearance in drift and Surber samples. A strong time dependance overshadowed all other relationships. The occurrences of specific macroinvertebrates in each stream and of the species diversity of each sample are presented. The dissolved oxygen regime of these two streams was also studied. Dissolved oxygen data taken approximately bimonthly are presented as are tables of biochemical oxygen demand in which samples were incubated both at 5C and 20C.

ROUND HORIZONTAL THERMAL-BUOYANT JET IN A CROSS FLOW,
Washington Univ., Seattle. Dept. of Civil Engineering.
R. E. Nece, and J. D. Littler.
Available from the National Technical Information Service as PB-223 376, $3.50 in paper copy, $1.45 in microfiche. Technical Report No. 34, June 1973. 55 p, 30 fig, 13 ref, append. OWRR A-056-WASH (1).

Descriptors: *Thermal pollution, *Jets, Diffusion, Hydrodynamics, Flow, Temperature, Velocity, Water temperature, *Flow rates, Froude number, *Boundary processes.
Identifiers: *Cross flow, *Buoyant jets.

Results are presented for an experimental study of round buoyant jets discharged horizontally into and at right angles to the direction of flow of an unstratified receiving stream. Objectives were to obtain empirical relationships defining the trajectory and near field temperature distribution of such jets. Experimental results are given in the form of dimensionless jet trajectories and center-

line temperature elevation above that of the receiving fluid. Experimental data were obtained for jet densimetric Froude numbers (as conventionally defined) of 5, 10, and 15, combined with jet discharge/cross flow velocity ratios of 0.5, 1, 5, and 10. The velocity ratio was far more significant in determining the jet behavior than was the densimetric Froude number. Velocity ratios and Froude numbers tested span ranges commonly encountered in outfall designs. Experimental parameters, including boundary conditions with the jet being discharged from a circular outfall located close to the bottom of the receiving channel, were intended to be representative of simplified approximations of a single-outfall cooling water discharge from a thermal plant located on a river. Effects of the near proximity of the channel bottom and of the small channel depth/jet diameter ratio of 4 were clearly evident in comparison of the results with those of previous cases of jets discharged into cross flows.

R. I. Lipper.
Kansas Water Resources Research Institute, Manhattan, Project Completion Report, Contribution No. 121, May 1973. 19 p, 17 fig, 15 tab, 28 ref. OWRR A-008-KAN (1). 14-01-0001-786.

Descriptors: *Feedlots, *Water pollution sources, Runoff, Hydrology, *Farm wastes, *Rainfall simulators, Chemical oxygen demand, Biochemical oxygen demand, Nitrogen compounds, Bacteria, Solid wastes, Water pollution control.
Identifiers: *Beef animals, Characterization.

Two test feedlots, each with an area of 0.05 acre were stocked with beef animals on a finishing ration at a rate of 200 animals per acre (10 steers per test lot). One feedlot was entirely surfaced with concrete, the other only at feedbunk and waterer. Slope was 2 percent. Rainfall was simulated by sprinklers capable of application rates from 0.4 to 2.5 in. per hour. Runoff was measured and sampled. Runoff rate and volume were compared to application rate and volume. Concentrations of BOD, COD, nitrogen compounds, solids, and bacteria were determined. The effects of certain management practices on runoff characteristics were observed.

NITROGEN AND PHOSPHORUS IN A STRETCH OF THE GUADALUPE RIVER, TEXAS, WITH FIVE MAIN-STREAM IMPOUNDMENTS,
Southwest Texas State Univ., San Marcos.
H. H. Hannan, W. C. Young, and J. J. Mayhew.
Hydrobiologia, Vol 41, No 3, p 419-441, May 15, 1973. 9 fig, 4 tab, 32 ref.

Descriptors: *Nitrogen, *Phosphorus, Pollutant identification, *Reservoir storage, *Texas, *Nutrients, *Water analysis, Water pollution sources, Water pollution effects, Sewage effluents, Water sampling, Chemical analysis, Industrial wastes, Pollutant identification, Fluctuations, Impoundments, Nitrates, Nitrites, Ammonia, Phosphates, Outlets, Treatment facilities, Plant growth, Phytoplankton, Methodology, Cycling nutrients.
Identifiers: *Guadalupe River (Tex), *Seasonal variation, Kjeldahl nitrogen, Organic phosphorus, Chlorophyll a, Comal River, Nuphar, Philodendron, Lake Gonzales, Eichornia crassipes, Lake Wood, Meadow Lake, Lake McQueeney, Lake Dunlap, Ludwigia, Dissolved nitrogen, Dissolved phosphorus.

Nitrogen and phosphorus were studied in a 168-km stretch of the Guadalupe River that had five mainstream impoundments. Flow through the study area was controlled by releases from these five reservoirs and from Canyon Reservoir, a deep-storage reservoir, located 30 km upstream. Parameters measured monthly on a diel basis at 16 stations were nitrate nitrogen, nitrite nitrogen, ammonia nitrogen, Kjeldahl nitrogen, inorganic phosphate phosphorus, organic phosphate phosphorus, and total phosphate phosphorus. Inorganic nitrogen concentrations observed were as high or higher than that previously reported for other bodies of water. Nitrate nitrogen, in general, reached seasonal minima in summer and maxima in winter. Nitrite nitrogen showed considerable variation with no meaningful pattern except that higher concentrations occurred in association with high chlorophyll a and high Kjeldahl nitrogen, regions and periods of low river flow, and large phytoplankton populations. There was no increase in concentration of any form of nitrogen in the vicinity of sewage outfalls and no downstream accrual. Phosphorus levels in the study area were as high or higher than those reported in studies of other bodies of water. Total phosphate phosphorus was the most critical phosphate parameter in assessing eutrophication. Seasonally, it ranged from a winter high to a summer low. Concentrations were highest immediately below sewage outfalls and decreased as water progressed downstream. Inorganic-phosphate-phosphorus concentrations showed no clear seasonal trend but were clearly associated with sewage outfalls. Total organic phosphate phosphorus varied seasonally, with high concentrations occurring during the spring and low concentrations in the fall, showed no correlation with sewage outfalls, but was correlated to a degree with total Kjeldahl nitrogen and chlorophyll a. No consistent pattern of diel fluctuations was evident for any phosphorus or nitrogen compounds analyzed. (Holoman-Battelle)

SOURCES AND SINKS OF NITROGEN AND PHOSPHORUS: WATER QUALITY MANAGEMENT OF LAKE GEORGE (N.Y),
Rensselaer Polytechnic Inst., Troy, N.Y.
D. B. Aulenbach, and N. L. Clesceri.
In: Water-1972, AICHE Symposium Series No 129, Vol 69, p 253-262, 1973. 1 fig, 3 tab, 21 ref.

Descriptors: *Phosphorus, *Nitrogen, *Sinks, *Water pollution sources, Precipitation (Atmospheric), Waste water (Pollution), Streamflow, Sewage effluents, Path of pollutants, Nutrients, Water quality control, Chemical precipitation, Trophic level, Oligotrophy, Mesotrophy, Bottom sediments, Lake morphology, Discharge (Water), Runoff, Lake sediments, Surface waters, *New York.
Identifiers: *Lake George (NY), *Nutrient sources, Fate of pollutants, Accumulation.

Measurements were made of the nitrogen and phosphorus contents of the precipitation, stream runoff, and wastewater discharges tributary to Lake George; the lake water itself; and the equivalent of the outlet at Ticonderoga. The major source of nitrogen to the lake is the precipitation which falls directly on the lake. The major source of phosphorus is from wastewater discharges on the watershed. Apparently both the nitrogen and the phosphorus are precipitated and accumulated in the bottom sediments. The concentration of phosphorus in the lake is approaching the critical level of 10 micrograms/l. Removal of phosphorus from wastewater is recommended. (Holoman-Battelle)
W73-14284

PRELIMINARY SURVEY OF MERCURY AND OTHER METALS CONTAINED IN ANIMALS FROM THE FRASER RIVER MUDELATS,
British Columbia, Univ., Vancouver. Inst. of Oceanography.
T. R. Parsons, C. A. Bawden, and W. A. Heath.
Journal of the Fisheries Research Board of Canada, Vol 30, No 7, p 1014-1016, July 1973. 1 tab, 2 ref.

Descriptors: *Heavy metals, *Chemical analysis, Estuarine environment, Water pollution sources, *Benthic fauna, *Pollutant identification, Crabs, *Mercury, Estuaries, Cadmium, Cobalt, Copper, Manganese, Nickel, Zinc, Lead, Colorimetry, Oysters, Marine animals, Mussels, Biological communities, *Canada.
Identifiers: *Fraser River estuary, *Animal tissues, Bioaccumulation, Sample preparation, Silver, Flameless atomic absorption spectrophotometry, Atomic absorption spectrophotometry, Cancer magister, Cowichan Bay, Kitimat Arm, Mya arenaria, Crassostrea gigas.

Additional research has been directed toward answering the question of the source of mercury contamination in the Fraser River estuary. The Fraser River mudflat community was divided into two areas from which crabs were collected for Hg analysis. Crabs and other marine organisms were also collected from other areas for comparative analyses. Soft tissse was freeze-dried, powdered, digested with concentrated HNO_3, evaporated to dryness, diluted with 1.5 M HCl, and analyzed by atomic absorption spectrophotometry for Ag, Cd, Co, Cu, Mn, Ni, and Zn. Pb analysis was done colorimetrically and Hg was analyzed by flameless AAS after sample digestion using sulfuric acid and hydrogen peroxide. Benthic animals from Sturgeon Bank contained larger amounts of mercury and other metals than animals from similar environments on the coast of British Columbia. These high levels of metals are believed to be associated with the Vancouver City sewer outfall. (Holoman-Battelle)

DISCHARGE OF NITRILOTRIACETATE (NTA) FROM TWO SEWAGE TREATMENT FACILITIES LOCATED IN A MIDCONTINENTAL CLIMATE,
Fisheries Reasearch Board of Canada, Winnipeg (Manitoba). Freshwater Inst.
J. W. M. Rudd, B. E. Townsend, and R. D. Hamilton.
Journal of the Fisheries Research Board of Canada, Vol 30, No 7, p 1026-1030, July 1973. 2 fig, 2 tab, 10 ref.

Descriptors: *Nitrilotriacetic acid, Treatment facilities, *Sewage effluents, *Aerated lagoons, *Activated sludge, *Discharge measurement, Sewage treatment, Water pollution sources, Biochemical oxygen demand, Effluent streams, Influent streams, Dissolved oxygen, Pollutants, Pollutant identification, *Canada.
Identifiers: *Degradation rates, Red River, Assiniboine River, Chemical concentration.

Concentrations of NTA entering the Red and Assiniboine rivers from two Winnipeg sewage treatment facilities were monitored. The activated sludge plant usually discharged less than 0.5-mg NTA/liter throughout the year. The aerated sewage lagoon discharged less than 20 micrograms NTA/liter during summer. It was believed that the NTA passed through the lagoon essentially unchanged during winter (1800 micrograms NTA/liter) when degradation rates must have been extremely low. No NTA was detected in river water downstream from either of these facilities. It was concluded that even under extreme environmental conditions NTA discharge did not present a hazard to either local aquifers or local biota. (Holoman-Bettelle)

B. J. Mathis, and T. F. Cummings.
Journal Water Pollution Control Federation, Vol 45, No 7, p 1573-1583, July 1973. 3 fig, 7 tab, 20 ref. OWRR A-034-ILL (2).

Descriptors: *Heavy metals, *Bottom sediments, *Tubificids, Clams, Freshwater fish, *Water pollution, *Pollutant identification, Chemical analysis, Absorption, Benthic fauna, Cadmium, Chromium, Cobalt, Copper, Lead, Nickel, Zinc, Water analysis, Oligochaetes, Annelids, Mud-water interfaces, Water pollution effects, Water sampling, Laboratory tests, Aquatic animals, White bass, Carp, Carnivores, Omnivores, Mollusks, Path of pollutants.
Identifiers: *Illinois River, Sample preparation, Atomic absorption spectrophotometry, Bioaccumulation, Lithium, Dorosoma cepedianum, Animal tissues, Esox lucius, Largemouth bass,

mallmouth bass, Fate of pollutants, Northern ike, Fingernail clam.

his study was designed to assess the degree of etal contamination in a large midwestern river. he river is utilized both by industries for manuacturing and waste disposal purposes and by ciies as a source of potable water and a means of astewater disposal. Analyses were made for opper, nickel, lead, chromium, lithium, zinc, obalt, and cadmium in bottom sediments, water, ibificid annelids, clams, and fishes. Metal conentrations were higher in sediments than in water id organisms. Clams and worms that inhabit the ud or mud-water interface exhibited the highest etal concentrations of any of the organisms. ishes that are primarily carnivorous in nature exbited lower mean muscle concentrations of opper, nickel, lead, chromium, zinc, and cadmin than did omnivorous fishes. (Holoman-Battelle)

IOLYBDENUM CONCENTRATIONS IN TISUES OF RAINBOW TROUT (SALMO GAIRDERI) AND KOKANEE SALMON (ONCORYNCHUS NERKA) FROM WATERS DIFFERNG WIDELY IN MOLYBDENUM CONTENT,
olorado Univ., Boulder. Dept. of Environmental, opulation, and Organismic Biology.
V. Ward.
ournal of the Fisheries Research Board of anada, Vol 30, No 6, p 841-842, June 1973. 1 tab, ref.

Descriptors: *Water analysis, *Molybdenum, Rainbow trout, X-ray fluorescence, Specrophotometry, Absorption, Heavy metals, Reseroirs, Sockeye salmon.
Identifiers: *Biological samples, *Bioaccumulaon, *Kokanee salmon, Liver, Kidneys, Testes, Tissue, Ovaries, Spleen, Bone, Muscle, Intestine, tomach, Brain, Fat, Gills, Salmo gairdneri, Onorhynchus nerka.

almo gairdneri and Oncorhynchus nerka were obained from Dillon and Eleven Mile Reservoirs and hatchery in Colorado for analysis of molybenum content. Liver, kidney, testes, ovaries, pleen, bone, muscle, intestine, stomach, brain, at, and gill samples were analyzed by x-ray luorescence. Water samples were analyzed specrophotometrically. Concentrations of molybenum in tissues of rainbow trout increased only lightly with increase in molybdenum concentraion of the water. Fish from high (300 ppb) molybenum water had mean concentrations of 13-332 pb on a wet-weight basis; those from low (6 ppb) nolybdenum water, 10-146 ppb; and those from race molybdenum water, 5-118 ppb. Rainbow rout exhibited generally higher molybdenum conentrations than did kokanee salmon in high nolybdenum water. A possible plateau mechanism oncerning molybdenum accumulation by salnonids is discussed. (Little-Battelle)

Descriptors: *Computer models, *Systems analysis, Environmental control, *Water quality, *California, *Model studies.
Identifiers: *Malibu watershed (Calif).

Computer models are described in hydrology, water quality, ecology, behavioral systems, and data management prepared as a part of a multidisciplinary project studying the environment of the Malibu watershed. Over one hundred models have been selected and described from the literature, and possible applications of the models to the protection, planning and management of the Malibu watershed are discussed in terms of an environmental systems approach. The objective has been to describe computer methods, techniques, software, and possible application of computer systems to general environmental systems with emphasis on the water resource.

Identifiers: Animals, Books, Food chains, Land use, Pesticides, *Pollution, *Production, Protection, Radiation, *Water pollution control, Water pollution sources.

Whole-organism biology, as opposed to specialized aspects of biology, such as molecular biology, is discussed. How organic matter is made and converted from one form to another is discussed. Topics such as synthesis and food chains, primary production, conversion, definitions and practical methods, the factors of production and the biotic factors of production are all discussed. A discussion on how man has, deliberately or accidentally, interfered with the natural flow of production is presented. Grazing, destruction of animals, cultivation of crops, cropping of animals and land use are considered. How man has polluted the environment is stressed. Terrestrial pollution, atmospheric pollution, organic matter, pollution of the sea, pesticides and radioactive wastes are discussed. The possible ways in which man may protect himself from mismanagement of nature's resources are presented.--Copyright 1973, Biological Abstracts, Inc.

Available from the National Technical Information Service as PB-223 566, $2.75 in paper copy, $1.45 in microfiche. Rhode Island Water Resources Center Final Report, 1973. 12 p, 4 tab. OWRR A-041-RI (1). 14-31-0001-3840.

Descriptors: *Phenols, *Chlorination, *Toxicity, Water supply, *Organic compounds, *Amino acids, Water pollution sources, Water pollution effects.

In the investigation of interaction between organic pollutants and active chlorine in water, hydroxycinnamic acids were found to afford various chlorinated styrene and chlorinated quinone derivatives. Phenolic amino acids tyrosine gave chlorinated benzyl acetonitrile derivatives. Furthermore, it was discovered that, in general, free amino acids afford nitrile derivatives even in a very high dilution. To evaluate the possible effects of the products to human and ecological systems, antimicrobial, molluscicidal activities and acute toxicities to mice were investigated. In each case, mild activity was observed with most of the compounds.

LOUISIANA SUPERPORT STUDIES--REPORT 2, PRELIMINARY ASSESSMENT OF THE ENVIRONMENTAL IMPACT OF A SUPERPORT ON THE SOUTHEASTERN COASTAL AREA OF LOUISIANA,
Louisiana State Univ., Baton Rouge. Dept. of Marine Science.
J. H. Stone.
Available from NTIS, Springfield, Va. 22151 as COM-73-10544, Price $6.00 printed copy; $1.45 microfiche. Louisiana State University, Baton Rouge, Center for Wetland Resources Report LSU-SG-72-05, 1972. 345 p, 79 fig, 110 tab, 15 ref.

Descriptors: *Harbors, *Oil spills, *Water pollution effects, *Ecosystems, *Louisiana, Gulf of Mexico, Environmental effects, Biology, Aquatic life, Coasts, Estuaries, Ecology, Model studies, Tidal effects, Sediment transport, Engineering structures, Planning, Projections, Forecasting, Path of pollutants, Winds, Ocean currents, Littoral drift, Surveys, Continental shelf.
Identifiers: *Superport construction planning (La).

The objectives were (1) to conduct an overall environmental evaluation of a Superport operation at two hypthetical locations on the continental shelf off the southeast coast of Louisiana, (2) to establish wihin the limits of available data the existing environmental conditions at and around the proposed sites, and (3) to predict and/or document (a) the effects of an oil spill at or near the proposed sites and (b) the effects of operations. Oil-drift projections indicate that the site more distant from shore would have less effect because a potential spill there would probably not reach the estuarine areas. Oil-drift projections of hypothetical oil spills are based on a hydrodynamical numerical model using wind conditions, local tides, and bathymetry. At the closer offshore site oil spills moved either northwest toward Timbalier Bay or northeast toward Barataria Bay. Oil spills at the farther offshore site did not impinge on the shorelines nor into the estuaries. Potential adverse effects resulting from an oil spill would be most severe in the estuaries. Oil could damage or kill extensive areas of marsh grass, thereby reducing or eliminating the most important food source for the major consumers, which are fishery species. Damage to the Gulf shoreline would probably be minimal unless the oil concentrated in the littoral currents, which are also used as a migratory aid. (Woodard-USGS)

AQUATIC INSECT COMMUNITIES IN THE RIVERS OF THE YORO, OBITSU, AND ISUMI, CHIBA PREFECTURE, JAPAN, (IN JAPANESE),
Freshwater Fisheries Research Lab., Tokyo (Japan).
H. Tanaka
Bull Freshwater Fish Res Lab Tokyo Vol 21 No 1, p 21-35 1971 Illus (English summary)
Identifiers: *Aquatic insects, Baetis Sp, Bamboo, Caddis Fly, Indicators, Industrial wastes, Invertebrates, Isonychia Japonica, *Japan (Chiba prefecture), Pollution, Rivers, Waste water, *Water pollution index.

In Nov. 1968, 23 stations were selected along three rivers that flow through sandstone areas and aquatic insect communities found there were investigated. The geographic and topographical features of the rivers are shown and water quality was observed. Insects were collected on the stony bed riffles and in the partially submerged bamboo bushes on the banks. Species (50) of insects and 9 species of other invertebrate animals were collected at the Yoro River. At the Obitsu River, 40 species of insects and 3 species of other invertebrate animals were collected. Finally, 34 species of insects and 8 species of other invertebrate animals were collected at the Isumi River. As many as 25 species of insects were found in all rivers. In all rivers, free-swimming mayflies showed predominant tendency, while the subsistence density of net-spinning caddis-flies was extremely low. In the majority of insects, practically no habitat preference was evident. Baetis sp. appear to be comparatively resistant against pollution by inorganic suspended matter. The aquatic areas were divided into 4 degrees, A-D, of pollution on the basis of number of species of insect communities at the stony bottom and the partially submerged bamboo. The assessment of water pollution of the sandy bed rivers attempted on the basis of the insect communities found in the partially submerged bamboo bushes is likely to be used in the future as one of the biological assessment methods of water pollution.--Copyright 1973, Biological Abstracts, Inc.

ELATIONSHIP BETWEEN EXTRACELLU-AR AND CELLULAR PRODUCTION IN THE ULPHURIC GREEN BACTERIUM HLOROBIUM LIMICOLA NADS. CHLOROBACTERIACEAE) AS COMPARED O PRIMARY PRODUCTION OF HYTOPLANKTON,
ialystok Medical Academy (Poland). Dept. of iology.
. Czeczuga, and F. Gradzki.
ydrobiologia, Vol 42, No 1, p 85-95, July 6, 1973. fig, 1 tab, 28 ref.

escriptors: *Primary productivity, *Organic atter, *Bacteria, *Phytoplankton, Photosynthes-, Bioassay, Carbon, Radioactivity techniques, hotosynthetic bacteria.
lentifiers: *Chlorobium limicola, *Poland, Sam-e preparation, Organic carbon, Wadolek Lake.

ark and double light bottles containing Chlorobi-n limicola and phytoplankton from two stands ere immersed in Wadolek Lake at depths of 0 to m to study the quantities of substances formed uring photosynthesis both inside and outside the ells. Each bottle was spiked with C-14-labelled aCO3. Assimilation of carbon and quantities of ubstances filtering outside the cells were also etermined in the dark bottles. After one day at ny depth, formalin was added to each bottle and ne contents filtered to separate algal cells from hlorobium bacteria. After drying of the filters, ne residue was measured with a Geiger-Mueller ounter. To measure extracellular matter, a por-on of the contents of each bottle was put on an luminum plate, evaporated and the activity mea-ured. Mean values of extracellular production of hytoplankton were 58.4 percent (stand II) and 5.2 percent (stand I) of cellular production, and or extracellular production of Chlorobium micola the values were respectively 44.7 percent tand II) and 70.7 percent (stand I). On the verage 70.8 percent of carbon assimilated in the ark filtered outside the cell in case of phytoplank-on, and 31.0 percent in the case of Chlorobium micola. Extracellular and cellular production in ase of phytoplankton and Chlorobium limicola as calculated for 1 square meter of the water olumn. (Little-Battelle)

PTAKE OF RADIONUCLIDES BY SOME QUATIC MACROPHYTES OF ISMAILIA ANAL, EGYPT,
tomic Energy Establishment, Cairo (Egypt). adiation Protection Dept.
V. E. Y. Abdelmalik, R. M. K. El-Shinawy, M. M. shak, and K. A. Mahmoud.
Hydrobiologia, Vol 42, No 1, p 3-12, July 6, 1973. 5 ab, 10 ref.

Descriptors: *Bioassay, *Radioactive wastes, Bioindicators, Aquatic plants, Absorption, Water ollution effects, Radioisotopes, Algae, Sago ondweed, Mathematical studies, Chara.
dentifiers: *Bioaccumulation, Cs-134, Co-60, Sr-0, P-32, Elodea densa, Ceratophyllum demersum, Potamogeton pectinatus, Ismailia Canal, *Egypt, Waterweeds, Hornworts, Data interpretation.

The uptake and accumulation of Cs-134, Co-60, Sr-90, and P-32 were studied with four aquatic nacrophytes: Elodea densa, Ceratophyllum demersum, Potamogeton pectinatus, and Chara sp. Tests were conducted with plants in large aquaria containing canal water labelled with the radionuclides. Periodically, portions of the plants were removed, dipped in running distilled water, blotted on filter paper, weighed, dried, ashed, and radioassayed. Statistical evaluations of the cor-relation between radionuclide concentration and uptake by the plants led to the following conclu-sions. (1) Uptake of the radionuclides was found to increase at increasing initial concentrations of the radionuclides in the water. (2) Maximum uptake was reached by most of the aquatic plants after different periods of contamination, ranging from 1 to 4 days. (3) Ceratophyllum was the most favora-ble biological indicator for strontium radioisotopes in concentrations ranging from 0.5 to 10 microcu-ries/l and for contamination periods up to 16 days. (4) Elodea was found to serve as a biological in-dicator for either strontium or phosphorus radioisotopes for limited contamination periods of 2 to 16 days for Sr and to 2 days for P isotopes. (5) Potamogeton was also found to serve as a biologi-cal indicator for limited contamination periods for strontium, phosphorus and cesium radioisotopes: 0 to 2 days for Sr, 2 to 16 days for P, and 0 to 2 days for Cs isotopes. ECOLOGICAL STUDIES IN THE PLANKTON OF CERTAIN FRESHWATER PONDS OF HYDERABAD-INDIA. III. ZOOPLANKTON AND BACTERIA,
Osmania Univ., Hyderabad (India). Hydrobiology Lab.
G. Seenayya.
Hydrobiologia, Vol 41, No 4, p 529-540, May 30, 1973. 8 fig, 2 tab, 27 ref.

Descriptors: *Ecology, *Biological communities, *Zooplankton, *Phytoplankton, *Bacteria, Animal populations, Organic matter, Water quality, Nutrients, Dominant organisms, Phosphates, Dis-solved solids, Crustaceans, Copepods, Water-fleas, Ponds, Rotifers, Rain, Algae, Diatoms, Limiting factors, Chlorella.
Identifiers: Chlorophyll a, Organic nitrogen, *In-dia, Macroinvertebrates, Macrothrix, Chydorus, Ceriodaphnia, Simocephalus, Alona, Pleuroxus, Latonopsis, Camptocercus, Chara, Nitella, Micro-cyclops, Mesocyclops, Ectocyclops, Eucyclops, Diaptomus, Thermocyclops, Periodicity, Euglena haematodes, Nitzschia gracilis, Anabaenopsis raciborakii, Lyngbya mucicola.

The ecological behavior of zooplankton and bac-teria were studied in freshwater ponds in India. Populations of the organisms were determined and related to rainfall and several chemical parameters (oxidizable and nitrogenous organic matter, phosphates, and dissolved solids). Cladocerans were more abundant than copepods, rotifers or os-tracods in all the ponds investigated. The pond harboring Chara and Nitella had a dense popula-tion of Chydorus. Thermocyclops grew abun-dantly in oxygen-rich water. The pulses of zooplankton preceded those of phytoplankton and the grazing effect was very well marked in one of the ponds. Ponds smaller in dimension harbored denser populations of bacteria. Higher concentra-tions of phosphate, dissolved solids, and oxidiza-ble and nitrogenous organic matter favored their multiplication. Bacterial pulses almost coincided with those of phytoplankton - more precisely with chlorophyll-a. Possibly microbes fed on the freshly liberated materials from the phytoplank-ters. THE LIMNOLOGY OF NITROGEN IN AN OKLAHOMA RESERVOIR: NITROGENASE ACTIVITY AND RELATED LIMNOLOGICAL FACTORS,
Oklahoma State Univ., Stillwater. Dept. of Zoolo-gy.
D. W. Toetz.
The American Midland Naturalist, Vol 89, No 2, p 369-380, April 1973. 7 fig, 3 tab, 20 ref. OWRR-A-012-OKLA (4).

Descriptors: *Nitrogen fixation, *Nitrogen cycle, *Nitrification, Water analysis, Water temperature, Nitrates, Nitrites, Ammonia, Nitrogen, Lakes, Plankton, Cyanophyta, Nutrients, Seasonal, Sedi-ments, Absorption, Enzymes, Secchi disks, *Oklahoma.
Identifiers: *Nitrogenase, Acetylene reduction, Transparency, *Lake Carl Blackwell (Oklahoma), Mineralization.

The surface waters of Lake Carl Blackwell, Oklahoma, were assayed, using acetylene reduc-tion techniques, for their N2 fixing potential at in-tervals of 2 to 3 weeks, between November 1969, and July 1971. Data were obtained on limnological factors which affect the rate of N2 fixation; tem-perature, transparency of the water and concen-tration of nitrate, nitrite and ammonia at meter in-tervals. The ranges of the rates of ethylene production by concentrated and unconcentrated plankton were 0.1 to 225.6 and 50.6 to 185.4 nmoles per mg N hr, respectively. Rates fluctuated widely during the season and were nil in winter. Acetylene reduction at the surface was associated with the expanding phase of blooms of blue-green algae. Acetylene reduction by the sediments was also observed and uptake of Nitrogen-15 by the plankton verified that an N2 fixing potential exists in the lake. Observations on the seasonal cycle of inorganic nitrogen revealed that nitrification predominated in winter and early spring. Decreases in inorganic N in early summer at the surface were attributed to uptake by autotrophs. Mineralization proceeded after the demise of the autotrophs in autumn. During summer stagnation, nitrate, ammonia and nitrite were stratified, but there was no evidence of denitrification. (Little-Battelle)

THE ENVIRONMENTAL TOXICITY OF CRAS-SIN ACETATE USING TETRAHYMENA PYRIFORMIS AS A MODEL,
Oklahoma Univ., Norman. Dept. of Zoology.
D. L. Perkins, and L. S. Ciereszko.
Hydrobiologia, Vol 42, No 1, p 77-84, July 6, 1973. 4 fig, 5 ref.

Descriptors: *Bioassay, *Toxicity, *Protozoa, Reproduction, Growth rates, Ecology, Coral, Animal physiology.
Identifiers: Crassin acetate, Tetrahymena pyrifor-mis, Pseudoplexaura porosa, Mobility.

Crassin acetate, a macrocyclic diterpene lactone, may constitute as much as 1.5 percent of the dry weight of the cortex of the gorgonian Pseudoplex-aura porosa (HOUTTUYN). An amicromucleate strain of Tetrahymena pyriformis was cultured and subjected to various concentrations of the compound to investigate its effect on motility and growth. The effects of the compound were essen-tially concentration dependent and for concentra-tions of 0.027 to 0.133 millimoles, they may be summarized as follows: increased generation time from 0 to 14 hours after subculture; decreased population density; decreased motility; and death. The conclusions of this investigation have been extended to include a possible role of the macro-cyclic diterpenes in their natural environment, i.e., crassin acetate and related compounds function in the marine ecosystem by decreasing the viability of ciliated larvae of organisms which compete with the gorgonians for space. (Little-Battelle)

TOXICITY ASSESSMENT OF TREATED MU-NICIPAL WASTEWATERS,
California Univ., Berkeley. Sanitary Engineering Research Lab.
L. A. Esvelt, W. J. Kaufman, and R. E. Selleck.

Journal Water Pollution Control Federation, Vol 45, No 7, p 1558-1572, July 1973. 4 fig, 6 tab, 12 ref.

Descriptors: *Bioassay, Waste water (Pollution), Waste water treatment, *Toxicity, *Sewage effluents, *Water pollution effects, Laboratory tests, Freshwater fish, Lethal limit, Mortality, Pilot plants, *Shiners, Sticklebacks, Chemical precipitation, Ion exchange, Activated sludge, Sewage treatment, Biological treatment, Nutrient removal, Pollutants, Ammonia, Organic compounds, Heavy metals, Lead nickel, Cadmium, Copper, Zinc, Sulfides, Phenols, Biochemical oxygen demand, Chemical oxygen demand, Suspended solids, Hydrogen ion concentration, Phosphorus, Sorption.
Identifiers: Golden shiner, *Three-spined stickleback, Median tolerance limit, Continuous flow technique, Notemigonus crysoleucas, Gasterosteus aculeatus, Chemical composition, Lime precipitation, Grease, Dechlorination, Clinoptilolite ion exchange, Atomic absorption spectrophotometry, Cyanides, Methylene blue active substance.

Bioassay studies of the toxicity of municipal wastewaters and its removal by conventional and advanced waste treatment processes were conducted with effluents from full-scale and pilot-plant treatment facilities. Wastewater toxicities were determined before and after each treatment process with continuous-flow, on-line bioassays using golden shiners and three-spined sticklebacks. Primary effluent 96-hr TL50 values from four communities averaged about 45 percent. Good correlations were observed between the toxicity and methylene blue active substance and NH3-H concentrations in primary and treated effluents. Biological treatment with activated sludge at conventional loadings removed most toxicity from primary effluents, and chemical precipitation with lime at pH 11, followed by recarbonation, reduced the toxicity to an average 96-hr TL50 of 75 percent. Further ion exchange and sorption treatments resulted in even less toxic effluents. Chlorination of all effluents resulted in increased toxicity, and dechlorination with sodium bisulfate resulted in the removal of all chlorine-induced toxicity. (Holoman-Battelle)

BIOLOGICAL EFFECTS OF COOLING TOWER BLOWDOWN,
National Environmental Research Center, Corvallis, Oreg.
R. B. Garton.
In: Water-1972, AIChE Symposium Series No 129, Vol 69, p 284-292, 1973. 5 fig, 9 tab, 6 ref.

Descriptors: Toxicity, *Rainbow trout, *Bioassay, *Cooling towers, Chromates, Zinc, Phosphates, Sulfates, Sodium, Ammonia, Boron, Water pollution effects, Chlorophyta, Heavy metals.
Identifiers: *Blowdown, Selenastrum capricornutum, Morpholine, Cyclohexylamine, Hydrazine, Salmo gairdneri, Standard methods, Sodium chromate, Zinc phosphate.

Toxicity was determined of a 'typical' cooling tower blowdown and of its individual components. Since blowdown composition is variable, a simulated blowdown was made using chemicals and concentrations listed in waste discharge permit applications. The mixture contained varying amounts of chromate, zinc, phosphate, sulfate, boron, sodium, ammonia, morpholine, cyclohexylamine, and hydrazine and simulated blowdown from the Trojan Nuclear Plant. Separate tests were also conducted with sodium chromate, zinc phosphate, and with blowdown without chromate. Fish (Salmo gairdneri) and an alga (Selenastrum capricornutum) were used in bioassays of the mixtures. Algal assays were conducted according to the 'Algal Assay Procedure, Bottle Test'. Fish bioassays were conducted in accordance with procedures given in 'Standard Methods'. Algal growth was reduced by blowdown at full strenth and at dilutions of 0.1. Fish were killed at dilutions of 0.1; no effect was observed at 0.032 dilution. The LC50 value was 0.068 dilution. With sodium chromate, algal growth was reduced at 0.139 ppm, and fish survived 96 hours at 31 ppm. Zinc phosphate had no significant effect on algal growth at 0.016ppm. The LC50 for fish was 0.09 ppm zinc phosphate. Based on all the tests, zinc and chromium were identified as the toxic components in the blowdown. It is noted that synergistic effects may occur in other mixtures containing different compounds. Furthermore, the organisms used in the bioassays must be specified since toxicities may differ for different ones. (Little-Battelle)

PHYSICO-CHEMICAL ASPECTS OF LAKE MCILWAINE (RHODESIA), A EUTROPHIC TROPICAL IMPOUNDMENT,
Rhodesia Univ., Salisbury. Div. of Biological Sciences.
B. E. Marshall, and A. C. Falconer.
Hydrobiologia, Vol 42, No 1, p 45-62, July 6, 1973. 9 fig, 1 tab, 35 ref.

Descriptors: *Physiochemical properties, *Impoundments, *Eutrophication, Hydrology, *Water quality, Water level fluctuations, Thermal stratification, Water chemistry, Tropical regions, Hydrologic budget, Water temperature, Dissolved oxygen, Nitrates, Ammonia, Hydrogen ion concentration, Conductivity, Nitrites, Chemical analysis, Water analysis, Phosphates, Alkalinity, Hardness (Water), Iron, Manganese, Heavy metals, Hypolimnion, Trophic level, Epilimnion, Water pollution, Pollutant identification.
Identifiers: Seasonal variation, Orthophosphates, *Rhodesia (Lake McIlwaine).

Lake McIlwaine is a tropical eutrophic impoundment in Rhodesia. The normal oxygen and temperature patterns are described, and the effect of flood water on these patterns is discussed. Several important chemical parameters are described, and the effects of lake-level fluctuations and stratification are outlined. There is a brief discussion on the effects of eutrophication in tropical lakes, and some indication is given of measures being taken to reduce nutrient input to Lake McIlwaine. (Holoman-Battelle)
W73-14291

EFFECTS OF REDUCED OXYGEN CONCENTRATIONS ON NORTHERN PIKE (ESOX LUCIUS) EMBRYOS AND LARVAE,
National Water Quality Lab., Duluth, Minn.
R. E. Siefert, W. A. Spoor, and R. F. Syrett.
Journal of the Fisheries Research Board of Canada, Vol 30, No 6, p 849-852, June 1973. 2 fig, 1 tab, 16 ref.

Descriptors: *Bioassay, *Reproduction, *Dissolved oxygen, Water temperature, Flow rates, *Pikes, Larvae, *Embryonic growth stage, Water pollution effects, Limiting factors, Mortality, Hatching.
Identifiers: Survival, Esox lucius.

The objective was to determine the effects of continuous dissolved oxygen concentrations in the range 50-12.5 percent saturation on the survival and development of northern pike (Esox lucius) embryos and larvae from egg fertilization until all surviving larvae fed. Eggs were mixed with milt for fertilization and placed in acrylic plastic experimental chambers containing three compartments, one compartment where the water and gas mixture entered, one containing the embryos, and one containing larvae. Tests were conducted at combinations of temperatures, flow rate, and oxygen concentration. At 15 and 19C, and at flows of 60 and 30 ml/min (velocities about 3.3 and 1.6 cm/min), 50 percent oxygen saturation was sufficient for survival and development of northern pike from fertilization until all surviving larvae fed. Oxygen tensions of about 33 percent saturation appeared inadequate for proper survival. (Little-Battelle)

CADMIUM UPTAKE BY FIDDLER CRABS EXPOSED TO TEMPERATURE AND SALINITY STRESS,
South Carolina Univ., Columbia. Belle W. Baruch Coastal Research Inst.
J. O'Hara.
Journal of the Fisheries Research Board of Canada, Vol 30, No 6, p 846-848, June 1973. 1 tab, 11 ref.

Descriptors: *Bioassay, *Cadmium, *Salinity, *Water temperature, Heavy metals, Radioactivity techniques, *Crabs, Absorption, *Thermal stress, Salt tolerance.
Identifiers: Fiddler crabs, *Bioaccumulation, Biological samples, Macroinvertebrates, Uca pugilator, Sample preparation, Scintillation counting, Gills, Hepatopancreas.

Fiddler crabs (Uca pugilator) were collected from an unpolluted estuary near Georgetown, South Carolina and, after acclimation, subjected to 1 microcurie of Cd-109 and 10 ppm Cd (2 plus) as cadmium chloride in filtered seawater at temperature and salinity combinations of 33, 25, and 10C and 3.0 and 1.0 percent salinity. After 24, 48, and 72 hr, samples were sacrificed and the gill and hepatopancreas weighed and digested for 24 hr. Scintillation fluid was added to the digested sample and Cd determined by scintillation counting. At each temperature crabs accumulated more Cd in low salinity water than in high salinity water. This effect is probably due to osmotic stress caused by the different salt concentrations. Maximum accumulations occurred at high temperature and low salinity with totals for gill and hepatopancreas of 4.98 micrograms at 24 hr, 10.10 micrograms at 48 hr, and 17.44 micrograms at 72 hr. rophyta, Systematics, Dominant organisms, Protozoa, Ecological distribution, Photosynthesis, Turbidity, Water chemistry, Ammonia, Hardness (Water), Nitrates, Alkalinity, Phosphates, Respiration, Chlorella, Chlamydomonas, Euglena, Diatoms, Cladophora, Competition, Laboratory tests, Dissolved oxygen, Water sampling.
Identifiers: *Fish ponds, Oscillatoria, Raphidiopsis curvata, Anacystis spp, Microcystis aeruginosa, Coelosphaerium, Anabaena circinalis, Ictalurus punctatus, Chlorophyll a, Coelastrum microporum, Desmids, Dictyosphaerium, Scenedesmus spp, Flagellates, Gloeocystis, Closterium, Crucigenia, Kirchneriella, Chlorococcum, Chlorogonium, Bumilleria, Tetraedron, Roya, Gomphosphaeria, Species diversity index, Spirogyra spp, Chara spp, Nitella, Rhizoclonium hieroglyphicum, Pithophora kewensis, Hydrodictyon reticulatum, Lyngbya, Oedogonium, Cosmarium tumidum, Ankistrodesmus falcatus, Sphaerocystis schroeteri, Quadrigula chodatii, Oocystis borgei, Planktosphaeria gelatinosa, Coelastrum proboscideum, Merismopedia tranquilla, Anacystis cyanea, Spirulina princeps, Nannochloris bacillaris, Schroederia ancora, Nephrocytium agardhianum, Staurastrum natator, Sphaerocystis schroeteri.

Data are presented on primary productivity and phytoplankton communities in new experimental ponds which received the following treatments; ammonium nitrate and triplesuperphosphate, triplesuperphosphate, cracked corn (10 percent crude protein) and Auburn No. 3 fish feed (36 percent crude protein). Comparative data on algal communities were also obtained from production ponds which received feeds or fertilizers. Basic ecological data on macro-algae are also presented. All nutrient additions to experimental ponds resulted in higher levels of gross photosynthesis and greater concentrations of chlorophyll a than were found in the control treatments. Fertilization with both nitrogen and phosphorus gave the highest values. Chlorophyll a and gross photosynthesis were higher in ponds receiving high protein content feed (Auburn No. 3) than in ponds to which low protein content feed (corn) was applied. Persistent blooms of blue-green algae occurred in ponds receiving nitrogen and phosphorus fertilization. Phosphorus only fertilization produced blooms of blue-greens, but these blooms did not persist as in the ponds to which nitrogen was also added. Control ponds were dominated by green algae. Blue-green algae were seldom abundant in feed treatments. Production ponds had high level of gross photosynthesis and large concentrations of chlorophyll a. Many of the production ponds which received feed applications developed heavy blooms of blue-green algae. The major species of blue-green algae observed were Oscillatoria sp., Raphidiopsis curvata, Anacystis nidulans, A. aeruginosa, Spirulina sp., and Anabaena circinalis. Heterocyst bearing forms, which can presumably fix nitrogen, were seldom noted in ponds that received continuous additions of nitrogen from fish feeds. Macro-algae are abundant in many fish ponds. Data illustrating the competition of macro-algae with phytoplankton are presented. (Holoman-Battelle)

THE METABOLISM OF LONG-CHAIN FATTY ACIDS AND ALCOHOLS BY CANDIDA TROPICALIS AND SACCHAROMYCES CEREVISIAE,
G. H. Bell.
Antonie van Leeuwenhoek, Vol 39, No 1, p 137-149, 1973. 6 fig, 5 tab, 10 ref.

Descriptors: *Metabolism, *Yeasts, *Alcohols, Growth rates, Organic acids, Marine fungi, Organic compounds, Plant growth, Hydrogen ion concentration
Identifiers: *Fatty acids, Substrate utilization, Batch cultures, Heterotrophic nutrition, Candida tropicalis, Saccharomyces cerevisiae, Aliphatic hydrocarbons, Tetradecanoic acid, Fate of pollutants, n-Paraffins, Octadecanoic acid, Dodecanoic acid, Gas oil, Continuous cultures, Pristane, Undecanoic acid, Tridecanoic acid, 1-Dodecanol, 1-Tetradecanol, 1-Hexadecanol, 1-Octadecanol, Hexadecanoic acid, Nonadecanoic acid, Eicosanoic acid, 1-Eicosanol.

The factors affecting the growth of Candida tropicalis and Saccharomyces cerevisiae on medium- and long-chain fatty acids and alcohols in batch culture were investigated. Growth on solid acids and alcohols dispersed in the medium is a maximum for tetradecanoic acid and tetradecanol. The poorer growth observed on shorter chain lengths can be ascribed to their toxicity to the yeasts, while the fall off in growth on the higher members is explained by their increasing insolubility in the medium. When the longer-chain-length acids are dissolved in a non-metabolizable hydrocarbon, the growth of C. tropicalis is improved, but that of S. cerevisiae is unaffected. This suggests that acids can enter the cells of the former organisms by direct contant with the hydrocarbon droplets. The surface of S. cerevisiae is too hydrophilic for this transfer mechanism to be possible. Fatty acids dissolved in gas oil are utilized as substrates for the growth of Candida tropicalis in competition with the n-paraffins contained in the gas oil. Each fatty acid contributes to a constant proportion of yeast produced, but this proportion decreases as the chain is lengthened. Thus, in mixtures of gas oil with dodecanoic acid, 65 percent of the yeast is produced from metabolism of the acid, while with octadecanoic acid only 15 percent is produced. The log specific rates of utilization of the fatty acids within this range diminish linearly with increasing chain length. (Holoman-Battelle)

ECOLOGICAL EVALUATION OF MULTIUSE WATERS RECEIVING PRIMARY TREATMENT EFFLUENT PRIOR TO A MAJOR FLOW INCREASE,
Connecticut Univ., Storrs. Inst. of Water Resources.
J. D. Buck.
Available from the National Technical Information Service as PB-223 502, $2.75 in paper copy, $1.45 in microfiche. Completion Report, 1973. 6 p, 1 fig, 1 tab, 5 ref. OWRR A-037-CONN (2). 14-31-0001-3207.

Descriptors: *Estuaries, *Sewage effluents, Pollutants, *Phytoplankton, Nitrates, Phosphates, Biochemical oxygen demand, Coliforms, *Connecticut, Invertebrates, Streptococcus, Monitoring, Sampling, Dissolved oxygen.
Identifiers: Fecal streptococci, Benthic invertebrates, *Mumford Cove (Conn).

A chemical and biological study is described for a Connecticut estuary receiving 0.25-0.50 MGD of treated sewage effluent prior to construction of a secondary treatment plant with a projected flow of 5-6 MGD. An adjacent, unpolluted cove was used as a control. Three stations in each estuary were sampled bi-weekly from September 1970 to June 1972. Analyses included temperature, salinity, dissolved oxygen, B.O.D., Nitrate, and phosphate. Counts were made of total bacteria, total and fecal coliforms, fecal streptococci, phytoplankton, and benthic invertebrates. Results indicated that nitrate, phosphate, and D.O. levels at the current outfall area at the head of the receiving cove are high enough to suggest that the increased flow of fresh water and nutrients into the saline cove may produce adverse effects in terms of stimulating the growth of existing populations of flagellated phytoplankters. While only the effluent mixing area is affected at present, the greatly increased effluent volume projected for the cove will influence a larger area as a function of wind, tides, and other factors. The directive by the State of Connecticut Department of Environmental Protection to extend the new outfall area approximately one mile seaward into Fishers Island Sound is considered prudent.

ALGAL PHOTOSYNTHESIS, ALGAL ABUNDANCE, AND CHEMISTRY OF LAKE WATER AT FAIRMONT, MINNESOTA,
Minnesota Univ., St. Paul. Dept. of Ecology and Behavioral Biology.
A. S. Knoll, and R. O. Megard
Available from the National Technical Information Service as PB-223 428, $4.50 in paper copy, $1.45 in microfiche. University of Minnesota Limnological Research Center, Minneapolis, July 1973. 46 p, 17 fig, 7 tab, 8 ref. OWRR A-026-MINN (1).

Descriptors: *Eutrophication, *Algae, *Nutrients, Lakes, *Minnesota, Plankton, Phosphorus, Nitrogen, *Chlorophyll, *Photosynthesis, Nitrates, Water pollution effects.
Identifiers: Fairmont (Minn), Ammonia-nitrogen, Nitrate-nitrogen.

Concentrations of phosphorus, nitrate, ammonia, oxygen, chlorophyll a, and rates of algal photosynthesis in 5 lakes in Fairmont, Minnesota, were measured during spring, summer, and autumn, 1972. The relative abundance of the planktonic algae in the lakes was assessed by measuring the concentrations of chlorophyll a, one of the green pigments in algae and other plants. Average concentrations of chlorophyll a ranged from 43 mg/m3 in Budd Lake to 74 mg/m3 in Amber Lake. The average concentration for all five lakes, 57 mg/m3, is about twice the average concentration in Lake Minnetonka, near Minneapolis, and also about twice the highest concentrations in Lake Erie, the most polluted of the Great Lakes. Concentrations of dissolved phosphorus, nitrate-nitrogen, and ammonia-nitrogen were also very high. Substantial reductions of nutrient concentrations will be required to achieve significant reductions of algae in the Fairmont Lakes. It would be desirable to reduce the influx of both nitrogen and phosphorus, but phosphorus is easier to control, because many of the nuisance algal are able to fix nitrogen if there is sufficient phosphorus in the water.

Descriptors: Water pollution sources, *Sediments, *Nutrients, *Eutrophication, Lakes, Aquatic soils, Minerals, Water properties, *South Dakota, *Silts, Silting, Lake sediments, Water pollution effects, Monitoring.
Identifiers: *Gabion silt traps, Lake Herman (S. Dak), Prairie lakes, Lake Madison (S. Dak).

A surveillance program has been maintained on two shallow, warm water prairie lakes and their tributaries. One of these lakes, Lake Madison, is domestically polluted with the effluent from the sewage treatment plant of Madison, South Dakota. The other, Lake Herman, is polluted due to silta-

tion caused by run-off from a large, intensively farmed watershed. This surveillance program has resulted in comparisons of chemical nutrients and biota of a heavily silted lake with those of a relatively unsilted, but domestically polluted lake. The surveillance program on the Lake Herman tributaries has also led to conclusions regarding nutrient levels in successive spring run-offs. During the summers of 1969 and 1970 a total of seventeen gabion-type silt traps were constructed across the major feeder streams on the Lake Herman watershed in order to retard lake siltation. The traps were of several structural types and were constructed in locations with different types of creekbeds and different water-flow rates in order to evaluate which combinations of design and location were most effective. The traps were successful as filters for large debris but had limited success as silt-retaining devices. However, erosion occurred around or under many of the traps thus diminishing their effectiveness. (EPA)

BIOLOGICAL EFFECTS OF FENITROTHION IN THE DIET OF BROOK TROUT,
Fisheries Research Board of Canada, St. Andrews (New Brunswick). Biological Station.
D. J. Wildish, and N. A. Lister.
Available from ACS-Div. of Water, Air and Waste Chem., Publications Manager, Mellon Inst., 4400 Fifth Ave., Pittsburgh, Pa. 15213, Price $4.00. In: Preprints of Papers Presented at 165th National Meeting of American Chemical Society, April 8-13, 1973, Dallas, Tex: American Chemical Society, Division of Water, Air and Waste Chemistry, Vol 13, No 1, Paper 76, p 79-84, 1973.

Descriptors: *Pesticide residues, *Fishkill, *Toxicity, Pesticide toxicity, Canada, Forestry, Pest control, Insecticides, *Brook trout.
Identifiers: Spruce budworm, *Fenitrothion.

Aerial insecticide spraying to control the spruce budworm, a defoliating insect pest which seriously reduces tree growth, was begun in 1952 with DDT, but fenitrothion, 0,0-dimethyl-0 (3-methyl-4-nitrophenyl) phosphorothionate, has been used since 1968. The possibility that aquatic and terrestrial insects killed by operational spray doses of fenitrothion may cause lethal or sublethal effects directly in salmonids was shown by experiments to be unlikely. The highest level found in poisoned insects is 3,000 times less than the level at which behavioral effects were noted. Reductions in insects following spraying may be of sufficient magnitude and persistence to significantly reduce ration and hence reduce salmonid production. (Knapp-USGS)

CONCERNING THE INFLUENCE OF HERBICIDES ON SEVERAL FRESHWATER ANIMALS, UBER DEN EINFLUSS DER HERBIZIDE AUF EINIGE SUSSWASSERTIERE,
O. Pravda.
Hydrobiologia, Vol 42, No 1, p 97-142, July 1973. 17 fig, 20 tab, 80 ref.

Descriptors: *Herbicides, *Aquatic animals, *Bioassay, *Pesticide toxicity, *Water pollution effects, Invertebrates, Freshwater fish, Carbamate pesticides, Phenolic pesticides, Lethal limit, Laboratory tests, Chlorinated hydrocarbon pesticides, Frogs, Isopods, Crustaceans, Amphipoda, Waterfleas, Amphibians, Annelids, Tubificids, Gastropods, Mollusks, Carp, Phenols, Inorganic pesticides, Aquatic insects, Perches, Water temperature.
Identifiers: *Median tolerance limit, Sensitivity, Macroinvertebrates, Red-sided shiner, Phoxinus phoxinus, Planaria gonocephala, Turbellaria, Platyhelminthes, Tubifex, Lymnaea stagnalis, Pond snails, Scuds, Gammarus pulex, Daphnia pulex, Asellus aquaticus, Micronecta minutissima, Esox lucius, Northern pike, Cyprinus carpio, Leucaspius delineatus, Perca fluvatilis, Rana temporaria, Bugs, Tadpoles, Travex, Kampinex L, Rafex, Dinoseb, Agrion, Dikotex 30, MCPA, DP-Fest, Spritz-Hormit, TCP, NaTA, Ugex. Alipur, Liro CIPC, Phenoxyacetic acid.

Toxicity of fourteen herbicides has been determined for thirteen animal species: Planaria gonocephala, Tubifex sp, Lymnaea stagnalis, Daphnia pulex, Gammarus pulex, Asellus aquaticus, Micronecta minutissima, Esox lucius, Cyprinus carpio, Phoxinus phoxinus, Leucapius delineatus, Perca fluviatilis, Rana temporaria, in 510 laboratory experiments. It was followed in three concentrations and expressed both in tables, by the value LT50 or by the various degree of damage of the organisms, and in graphs. The organisms were divided into four groups according to their sensitivity to herbicides: (1) organisms with high sensitivity; (2) sensitive; (3) medium sensitive; (4) little sensitive. From the point of view of the toxicity the herbicides were divided into three groups: (1) powerfully toxic, (2) medium toxic; (3) little toxic. A relationship between the intensity of toxicity and the chemical structure of herbicides was found. The first group includes herbicides on the basis of carbamates and phenols, the second group includes the derivatives of phenoxyacetic acid, and the third group includes inorganic herbicides and those pertaining to the group of the chlorated organic substances. The menchanism of the toxic action was followed from the point of view of the mutual relationship of herbicide toxicity and the sensitivity of organisms. Eight basic types of this action were found. Special attention was paid to those types where significant reparation phases appeared during the experiments. Only inorganic herbicides and those from the group of the chlorated organic substances or eventually those on the basis of phenoxyacetic acid may be used for mass application in water economy. The use of herbicides from the group of phenols and carbamates should be prohibited near water bodies. (Holoman-Battelle)

EXAMINATION OF ULTRASTRUCTURE AND GROWTH OF THE CELL WALL OF SPYRIDIA FILAMENTOSA (WULF.) HARV., UNTERSUCHUNGEN UBER BAU UND WACHSTUM DER ZELLWANDE VON SPYRIDIA FILAMENTOSA (WULF.) HARV.),
Thessaloniki Univ., Salonika (Greece). Botanical Inst.
V. I. Tsekos, and S. Haritonidis.
Nova Hedwigia, Vol 23, No 4, p 785-793, 1972. 1 fig, 21 ref.

Descriptors: *Rhodophyta, *Marine algae, *Cytological studies, Plant growth, Marine plants, Electron microscopy, Plant tissues, Cellulose.
Identifiers: *Ultrastructure, *Cell wall, *Spyridia filamentosa, Polarization microscopy.

The structure and the course of development in cell walls of the red alga Spyridia filamentosa (Wulf.) Harv. were analyzed by cytochemistry and polarization microscopy. (1) The cell wall is composed of two layers; the inner one consisting of cellulose, the outer of acid carbohydrates. Contrary to other Rhodophyceae analyzed hetherto, the outer layer of Spyridia filamentosa exhibits birefringence; under the polarization microscope and after staining with methylene blue it appears distinctly stratified. (2) The cell wall proper of the youngest central cells in the thallus tip is uniform, and it encloses the whole protoplast without any gap. As it is the case with Ceramium species, adult central cells show three distinct regions: two cap-like parts (each of which at the basal and spical pole of the cell) and a conic part encircling the remainder of the cell. The origin of the wall structure of adult central cells is discussed. (3) The inner layer of the cell wall is composed of lamellae. (4) The intensity of the cellulose reaction and of birefringence increases with the ace of the cells. In young cells it is rather poor. (5) Nearly all parts of the thallus that border directly to the surrounding water have more or less thickened external walls. (6) Beside the axial pit connections of the central cells, which show an intense light refraction, there are another eighteen pits arranged in a ring at the apical pole. (Holoman-Battelle)

EFFECTS OF ARTIFICIAL DESTRATIFICATION ON PRIMARY PRODUCTION AND ZOOBENTHOS OF EL CAPITAN RESERVOIR, CALIFORNIA,
Michigan State Univ., East Lansing. Dept. of Fisheries and Wildlife.
A. W. Fast.
Water Resources Research, Vol 9, No 3, p 607-623, June 1973. 10 fig, 2 tab, 37 ref.

Descriptors: *Benthic fauna, *Primary productivity, *Destratification, *Mixing, Sampling, Oligochaetes, Midges, Clams, Phytoplankton, Radioactivity techniques, Animal populations, Tubificids, Mollusks, *California.
Identifiers: Sorting, Sugar flotation, Macroinvertebrates, Limnodrilus hoffmeisteri, Bathrioneurum vejdovskyanum, Evilyodrilus bavaricus, Evilyodrilus hammoniensis, Tubifex tubifex, Chironomus attenuatus, Procladius bellus, Procladius denticulatus, Tanytarsus spp, Corbicula manilensis, Asiatic clam, *El Capitan Reservoir (Calif).

El Capitan reservoir was artificially mixed using compressed air during the summers of 1965 and 1966 to investigate the effects of destratification on primary production and zoobenthos. Phytoplankton production was measured by the C-14 technique. Zoobenthos was sampled with an unscreened Ekman dredge, screened with a no. 30 sieve, and sorted by sugar flotation. Estimates of organisms not sorted by sugar flotation were made by subsampling sediments. Physical and chemical characteristics of the water were also determined. The zoobenthos was numerically dominated by oligochaete worms (Limnodrilus hoffmeisteri, Bathrioneurum vejdovskyanum, Evilyodrilus bavaricus, E. hammoniensis, and Tubifex tubifex) and chironomid larvae (Chironomus attenuatus, Procladius bellus, P. denticulataus, and Tanytarsus spp.). The Asiatic clam (Corbicula manilensis) became well established during the study period. The results show that mixing and reservoir volume increases resulted in more uniform physical and chemical conditions, aerobic conditions throughout the lake, increased primary production, increased depth distributions of zoobenthos, and zoobenthos population increases. Increased primary production was related to a decrease in algal depth distribution. This decrease was caused by incomplete destratification, since thermal microstratification persisted near the lake surface. Zoobenthos were distributed throughout the lake during mixing, whereas they were confined to shallow depths during well-stratified times. Water volumes increased three-fold during the study and greatly confounded interpretation of the mixing effects. (Little-Battelle)

DETRITUS IN LAKE TAHOE: STRUCTURAL MODIFICATION BY ATTACHED MICROFLORA,
California Univ., Davis. Inst. of Ecology.
H. W. Paerl.
Science, Vol 180, No 4085, p 496-498, May 4, 1973. 3 fig, 16 ref.

Descriptors: *Detritus, *Microorganisms, *Biodegradation, *Organic matter, Nutrients, Electron microscopy, Bioassay, Periphyton, Metabolism, *California.
Identifiers: *Lake Tahoe, Ward Creek, Sample preparation, Aggregation.

Water samples were collected from Lake Tahoe over a vertical profile of 0 to 440 m to investigate microbiological utilization of detritus. Subsamples were filtered through Metricel filters, fixed with glutaraldehye, dehydrated by stepwise immersion in increasing concentrations of ethyl alcohol, portions mounted and gold plated, and viewed by scanning electron microscopy (SEM). Subsamples were also monitored for microbial heterotrophic activity as a measure of mineralization rates by determining acetate uptake. Total particulate carbon, and acetate concentrations were determined in samples taken from all depths. In a separate study, detritus was collected from Ward Creek, a tributary of Lake Tahoe, homogenized, sterilized, and divided into dialysis bags which were impervious to detritus and microorganisms, but allowed passage of nutrients and metabolic waste products. Two sets of dialysis bags were used: one containing sterile detritus and one containing lake water and live microorganisms. Both sets were incubated in Lake Tahoe and periodically examined by light microscopy and SEM. The results show that readily identifiable groups of microorganisms present on nonliving particulate organic matter (detritus) in the upper waters of Lake Tahoe are attached in specific ways and appear responsible for detrital aggregation. This microflora is associated with active heterotrophic metabolism, but deeper waters possess little detrital microflora and little heterotrophic activity. (Little-Battelle)

DEEP-SEA MICROORGANISMS: IN SITU RESPONSE TO NUTRIENT ENRICHMENT,
Woods Hole Oceanographic Institution, Mass.
H. W. Jannasch, and C. O. Wirsen.
Science, Vol 180, No 4086, p 641-643, May 1973. 1 fig, 2 tab, 12 ref.

Descriptors: *On-site tests, *Deep water, *Sea water, *Marine microorganisms, *Microbial degradation, *Organic matter, *Nutrients, Organic compounds, Methodology, On-site data collections, Radioactivity techniques, Spectrophotometry, Incubation, Carbohydrates.
Identifiers: *Enrichment, *Substrate, Utilization, Degradation products, Biotransformation, Paper, Ulva, Balsa wood, Beech wood, Casamino acids, Sodium acetate, Mannitol, Sodium glutamate, Liquid scintillation, Chemical recovery, Starch, Agars, Gelatin, Fate of pollutants.

Since microbial conversion of organic substrates was rather retarded when lab cultures and mixed populations of surface-born marine bacteria were incubated in the deep sea, it was assumed that microflora indigenous to the deep water or sediment would respond differently. To check this possibility, a housing for sterilized sample bottles was devised that permitted inoculation directly on the deep-sea floor. A rack holding 20 120-ml bottles was enclosed in a pressure-tight aluminum cylinder. As in earlier experiments, the bottles contained the media in concentrated form in quantities of 1 to 10 ml and were equipped with punctured serum caps for self-inoculation. This sample-housing vessel was attached to the research submarine Alvin. The samples were incubated at 1830 m depth and 4 C. The bottles filled at the incubation site contained 0.1 percent starch, 0.033 percent agar or 0.1 percent gelatin. After retrieval and poisoning with HgC12, starch, agar, and gelatin concentrations were determined. Sterile samples of bond paper, paper towels, balsa wood, beech wood, and Ulva thalli were incubated in separate bottles for 51 wk and their decomposition determined. 30, 10, 5 and 2 micrograms/ml of isotopically-labeled mannitol, sodium acetate, sodium glutamate, and casamino acids were also deposited for 14 wk and the degree of substrate conversion into cell material and CO2 was measured. Total recovery of labeled material averaged 97 percent. After inoculation of sterile organic materials on the deep-sea floor and in situ incubation for 1 year, relatively minute rates of microbial transformation were recorded. This extremely slow conversion rate, as well as the type and quantity of organic matter normally reaching the ocean floor, appear to characterize microbial life in the deep sea. (Holoman-Battelle)

CHLORINE AND TEMPERATURE STRESS ON ESTUARINE INVERTEBRATES,
Academy of Natural Sciences of Philadelphia, Benedict, Md. Benedict Estuarine Lab.
R. I. McLean.
Journal Water Pollution Control Federation, Vol 45, No 5, p 837-841, May 1973. 2 fig, 1 tab, 11 ref.

Descriptors: *Thermal stress, *Chlorine, Water pollution effects, *Laboratory tests, *Estuaries, *Chlorination, Animal populations, Crustaceans, Model studies, Water pollution, Copepods, Shrimp, Amphipoda, Mortality, Water temperature, Cooling water, *Invertebrates, Larvae, Heat resistance, *Thermal pollution, Bioassay, Marine animals.
Identifiers: Macroinvertebrates, Synergistic effects, Chemical concentration, Barnacles, Nauplii, Gammarus, Beach fleas, Melita nitida, Palaemonetes pugio, Chlorine residual, Grass shrimp.

Five species of estuarine invertebrates subject to entrainment in the cooling water system of a steam electric station were exposed experimentally to chlorine and temperature stresses simulating plant operations. Estuarine water was injected with chlorine gas to achieve a final concentration of 2.5 mg/l total chlorine residual. This concentration effected as high as 80 percent population mortality in the barnacle nauplii Balanus sp and 90 percent in the copepod Acartia tonsa during a 5-min exposure. Temperature elevations of 10 F (5.5 C) and 20 F (11 C) for 3 hr had no significant effect on population mortality. Two amphipods, Gammarus sp and Melita nitida, and one species of shrimp, Palaemonetes pugio, exhibited greater tolerance to the same stress conditions. (Holoman-Battelle)

Descriptors: *Pesticide residues, *Degradation (Decomposition), *Algae, *Cyanophyta, Water pollution effects
Identifiers: *Pesticide degradation, Synechococcus elongatus

A method to quantitate the components of a two-component system which were unresolvable in a given gas chromatography system was developed. The method utilized the p-values of individual components. Blue-green algae from two streams in Rhode Island were examined for pesticide residue levels. In one case the levels of p,p'-DDT were 15-44 ppb dry weight of algae; the other was 1.8-18 ppb. Experiments indicated that Synechococcus elongatus accumulated within 24 hours virtually all of the p,p'-DDT added to the media. About 4% was metabolized to p,p'DDE which was found on the cell wall, none being detected within the cells. At a level of 0.99 ppm, the p,p'-DDT was not toxic to the organism.

CANADARAGO LAKE EUTROPHICATION: PHOSPHORUS ALONG A SECTION OF OCQUIONIS CREEK,
New York State Dept. of Environmental Conservation, Albany. Environmental Quality Research and Development Unit.
R. J. Mumford.
Technical Paper Number 21, October, 1972. 87 p, 11 fig, 3 tab, 27 ref, 1 appendix.

Descriptors: *Eutrophication, *Phosphorus, *Data collections, *Water pollution sources, Phosphates, Fertilizers, Outfall sewers, New York, Waste identification, Pollutant identification, Streams.
Identifiers: *Canadarago Lake (New York).

In order to better understand the problems of eutrophication, a detailed demonstration study of Canadarago Lake is being performed by the New York State Department of Environmental Conservation. This lake is an eutrophic hard-water lake location in Otsego County, and has four major inlets. The phosphorus levels in a 5.8 mile section of Ocquionis Creek are documented. Phosphorus levels were studied because of their known contribution to the problem of eutrophication. It was desired to know how phosphorus levels changed along the length of the Creek to determine the sources of the phosphorus. Samples were taken above and below possible point sources, at changes in land use, near tributaries, etc. Samples were taken at periods of low flow and analyzed for particulate, soluble, and total phosphorus. No large phosphorus levels were found from agricultural lands, possibly due to the lack of surface runoff. Point sources (open sewers) changed the phosphorus level only slightly due to the dilution of the stream. More extensive data collections are seen as desirable. (Poertner)

ntifiers: *Oyster relaying, Clean water, Oyster ansing.

he fall of 1966, the Microbiology Section of the lf Coast Research Laboratory launched a 3-r research project to study the problem of high iform counts in the waters over some of Mississpi's oyster reefs and to study the possibility of puration of oysters from closed area by relay-. Experimental depuration studies were conted in covered racks 30 x 18 x 3 inches, conucted of 1 inch welded wire mesh. Each rack acnmodated approximately 80 commercial size sters. Oysters were harvested with a hand dge, culled and placed in the rack and imdiately transferred to the depuration area. For dies of commercial relaying, the oysters were rvested by a power dredge boat and transported he depuration area and shoveled overboard. No ling was practiced. The glycogen content was asured on a composite sample from 10 oysters. all depuration studies, oyster samples were colted every other day after relaying and analyzed the coliform MPN and EC positive MPN. Baciological studies showed that the depuration of licator organisms from oysters was achieved in shorter time than the recommended 15 days. oodard-USGS)

NVIRONMENTAL EFFECTS OF HYDRAULIC REDGING IN ESTUARIES,
labama Marine Resources Lab., Dauphin Island.
B. May.
labama Marine Resources Bulletin No. 9, p 1-85, pril 1973. 27 fig, 13 tab, 100 ref. NOAA PL 88-09, Proj. 2-149-R.

escriptors: *Environmental effects, *Dredging, Estuaries, Ecology, Benthos, Hydrology, *Water uality, Biomass, Rivers, Estuarine environment, hannel improvement, Salinity, Circulation, Sediment transport, *Waste disposal, Sedimentaon, Turbidity, *Alabama.
lentifiers: Spoil disposal.

Hydraulic channel and shell dredging and open water spoil disposal have little significant immediate effect on water quality in Alabama estuaries. Almost all of the sediment discharged by dredges settles very rapidly and is transported by gravity along the bottom as a separate flocculated density layer and potentially harmful components of the mud are not dissolved into the water. There is a limited, temporary reduction in benthic organisms in areas affected by dredging. Spoil piles from channel dredges can indirectly affect the ecology and usefulness of estuaries by interfering with water circulation and altering salinity. The basic hydrological concepts which determine the effects of dredging should be applicable in other areas. Extensive regulations appaently are not necessary to protect water quality in open water dredging situations but spoil disposal practices from channel dredges must be reconsidered and appropriate new disposal plans developed. INFORMATION ON THE STUDY OF PHYTOPLANKTON OF THE HIGHER PART OF THE VORSKLA RIVER, (IN RUSSIAN),
Leningrad State Univ. (USSR).
A. S. Shaaban.
Vestn Leningr Univ Ser Biol. Vol 26, No 4, p 70-78, 1971. Illus. English summary.
Identifiers: Chlorophyta, Cyanophyta, Diatoms, Euglenophyta, *Phytoplankton, Rivers, Seasonality, *USSR (Vorskla River).

Phytoplankton of the Vorskla river (USSR) were studied in Borisovka, Belgorod region for 6 mo., from April to Sept. 1969. One hundred eighty-seven taxa of algae from 8 systematic groups were identified. Phytoplankton of the river sustains its diatom character during the period of material collection, but it was found that in summer a considerable growth of Chlorophyta, Cyanophyta and Euglenophyta occurred. It was shown that at the investigation point, phytoplankton had a fresh oligosaprobic character with inclination toward B-mesosaprobic in summer.--Copyright 1973, Biological Abstracts, Inc.

5D. Waste Treatment Processes

GUIDE TO THE PREPARATION OF OPERATIONAL PLANS FOR SEWAGE TREATMENT FACILITIES,
Synectics Corp., Allison Park, Pa.
E. L. Seiler, and J. W. Altman.
Copy available from GPO Sup Doc as EP1.23/2:73-263, $2.60; microfiche from NTIS as PB-223 346, $1.45. Environmental Protection Agency, Technology Series Report, EPA-R2-73-263, July 1973. 212 p, 39 fig, 14 tab. EPA Project 1709 FWA. Contract 68-01-0073.

Descriptors: *Management planning, *Operations research, *Operation and maintenance, *Optimization, Manpower, Systems engineering, Human resources, Operations, Publications, *Treatment facilities, Wastewater treatment, Sewage treatment.
Identifiers: Job aids, Performance standards, Performance aids, Management data, Operator data, maintenance data, *Human engineering, Job analysis.

A proceduralized methodology is provided to guide the initial and ongoing planning necessary for extracting maximum potential from wastewater treatment plants. The objective of the planning activities is the development of conceptual and applied tools for direct use by plant personnel in optimizing the cost-effectiveness of their plant, complementing the design engineering of the physical plant. The main body of the Guide is divided into five major steps, representing a proceduralized methodology for developing operational planning materials. The contents and sequencing of these steps are designed to rationally combine operational planning and design engineering. Heavy emphasis is placed on general methods and principles which can be applied to a wide variety of specific treatment plant designs and situations. The four appendixes of the Guide provide a detailed classification and description of planning materials deemed essential to plant functions of management, operations, and maintenance. Job descriptions, plant manuals, checklists, reference materials, task schedules, decision tables, and operating records are among the specific materials designed to support the above personnel functions. Thus, the appendixes serve to define the nature of the planning outputs while the five procedural steps of the main body provide a framework for their development. (EPA)

PREDICTING AND CONTROLLING RESIDUAL CHLORINE IN COOLING TOWER BLOWDOWN,
Pacific Northwest Environmental Research Lab., Corvallis, Oreg. National Thermal Pollution Research Program.
G. R. Nelson.
Copy available from GPO Sup Doc as EP1.23/2:72-273, $0.80; microfiche from NTIS as PB-223 378, $1.45. Environmental Protection Agency, Technology Series Report EPA-R2-73-273, July 1973. 48 p, 12 fig, 11 ref.

Descriptors: *Chlorination, *Chlorine, *Water treatment, *Cooling towers, *Mathematical models, Recirculated water, Biocontrol, Chemcontrol, Monitoring, Forecasting.
Identifiers: *Blowdown control, Residual chlorine, Splitstream chlorination.

A mathematical model which predicts and controls residual chlorine levels in cooling tower blowdown is developed and analyzed. The model has eight variations to allow for (a) the fraction of the recirculating water chlorinated, (b) the type of chlorine feed equipment used, and (c) the time length of the chlorine feed period. The variations to the model are useful not only in predicting residual chlorine levels in the blowdown, but also in making alterations in existing chlorination programs which minimize chlorine waste, provide more disinfecting efficiency, and reduce residual chlorine levels in the blowdown. (EPA)

STUDY OF UPFLOW FILTER FOR TERTIARY TREATMENT,
Jefferson Parish Dept. of Sanitation, Metairie, La.
J. E. Morrison.
Available from the National Technical Information Service as PB-223 354, $5.25 in paper copy, $1.45 in microfiche. Environmental Protection Agency Report EPA-670/2-73-074, September 1973. 62 p, 19 fig, 2 tab. EPA Project 17030 DMA.

Descriptors: *Filtration, *Tertiary treatment, *Sand filters, Separation techniques, Sewage treatment, *Waste water treatment.
Identifiers: *Upflow filter, *Suspended solids removal, Upgrading secondary effluent.

A sand-media upflow filter was installed at an existing trickling filter sewage treatment plant which receives combined domestic and industrial waste, to test its effectiveness in a tertiary treatment function. Preliminary testing was performed at three different flow rates and with different chemicals as flocculants and coagulant aids to determine optimum conditions for final, full-scale testing. In the final, full-scale test phase, a flow rate equivalent to 0.5 MGD was used, and alum was injected as required to produce satisfactory turbidity levels in filter effluent. The operation was monitored constantly for flow rate, inlet pressure, water temperature and alum input; influent and effluent values for turbidity, suspended solids, BOD, COD, total phosphate, orthophosphate and pH were determined. Filter performance was inconsistent and generally unpredictable. Alum as a coagulant was effective as an aid in contaminant reduction; however, the alum floc proved weak and its use resulted in short filter cycles. Polyelectrolytes used as coagulant aids to the alum proved ineffective in developing floc strength and extending the cycle duration. (EPA)

SLUDGE PROCESSING FOR COMBINED PHYSICAL-CHEMICAL-BIOLOGICAL SLUDGES,
Brown and Caldwell, Inc., San Francisco, Calif.
D. S. Parker, F. J. Zadick, and K. E. Train.
Copy available from GPO Sup Doc as EP1.23/2:73-250, $2.10; microfiche from NTIS as PB-223 341, $1.45. Environmental Protection Agency, Technology Series Report EPA-R2-73-250, July 1973. 141 p, 54 fig, 28 tab, 23 ref. EPA Project 17080 FSF. R801445.

Descriptors: *Sludge disposal, *Sludge treatment, Ultimate disposal, *Dewatering, Chemical precipitation, *Sludge digestion, Centrifugation, Solid wastes, *Waste water treatment.
Identifiers: *Chemical sludge processing, Centrifugal classification, Centrifugal dewatering, Recalcination, Chemical treatment.

Full scale combined sludge generation from a treatment sequence consisting of lime clarification, nitrification, and dentrification was studied. Pilot scale studies were conducted to wet-classify and dewater the combined sludges by means of two-stage solid bowl centrifugation. Anaerobic digestion of first stage centrate was also studied on a pilot scale. Predicted and measured sludge production agreed well using four coagulation modes in the primary. First stage centrifugation (wet classification), over a wide pH range, achieved high capture of calcium carbonate in relatively dry (42 to 57 percent total solids) cakes as well as good rejection of magnesium, phosphorus, and iron compounds in the centrates. At pH 11.0 or below, second stage centrifugation dewatered first stage centrate to produce 18 percent total solids cakes, with 80 percent solids recoveries. Dewatering deteriorated at a pH greater than 11.0. Anaerobic stabilization of thickened and unthickened first stage centrates showed volatile matter destructions of over 40 percent, high methane-content gas, and substantial increases in soluble magnesium and alkalinity during digestion. This investigation was a joint effort of the Central Contra Costa Sanitary District, Walnut Creek, California, and its consultant, Brown and Caldwell. (EPA)

DENTRIFICATION BY ANAEROBIC FILTERS AND PONDS - PHASE II.
Environmental Protection Agency, San Francisco, Calif. Water Quality Office.

Bio-Engineering Aspect of Agricultural Drainage, San Joaquin Valley, California, June 1971. 34 p, 12 fig, 4 tab, 6 ref. EPA Project 13030 ELY 06/71-14.

Descriptors: *Agricultural wastes, *Dentrification, *Irrigation water, Return flows, Nitrate, Anaerobic treatment, *Waste water treatment, *California, Filters, Filtration.
Identifiers: *San Joaquin Valley (Calif), Bacterial dentrification, *Anaerobic filters, Anaerobic ponds.

Operational criteria, design and operations costs for a treatment facility to remove nitrogen from agricultural tile drainage in the San Joaquin Valley were further investigated during 1970 at the Interagency Agricultural Wastewater Treatment Center near Firebaugh, California. The year-long study period is identified as Phase II. Based on projected nitrate-nitrogen concentrations for valley tile drainage water, the research in this phase extended earlier Phase I studies on the feasibility of bacterial dentrification by filters and covered ponds. The anaerobic filter with 1-inch rounded aggregate was capable of reducing influent nitrate-nitrogen from 30 mg/l at water temperatures from 12 to 16C at a 6-hour detention time, and from 15 mg/l to 2 mg/l at water temperatures of 10 to 24C at 1-hour detention time. Long-term operation of filters resulted in accumulation of bacterial mass which caused the deterioration of the hydraulic regime and nitrogen removal efficiencies. Air scour accompanied or followed by flushing with water was capable of controlling the bacterial mass. The consumptive ratio, a method to quantify the organic carbon source needed for anaerobic bacterial process, was affected by temperature and influent nitrogren concentration and was found to vary between approximately 1.2 and 2.4. The anaerobic covered pond reduced influent nitrate-nitrogen from 30 mg/l to mg/l at water temperatures of 12 to 16C with a 60-day detention time and from 15 mg/l to 2 mg/l at 20 to 2-C with a 10-day detention time. (Jones-EPA)

INSTREAM AERATION TO CONTROL DISSOLVED SULFIDES IN SANITARY SEWERS,
Jefferson Parish Dept. of Sanitation, Metairie, La.
K. L. Condon, Jr., R. A. Cooper, Jr., and A. J. England, Jr.
Available from the National Technical Information Service as PB 223 342. $3.25 in paper copy, $1.45 in microfiche. Environmental Protection Agency Report EPA 670/2-73-024, September 1973. 92 p, 34 fig, 6 tab, 10 ref. EPA Project 17010 ELP WPRD 121-01-68.

Descriptors: *Sulfides, *Odor, *Corrosion control, Aeration, Sewers, *Waste water treatment, Oxygen demand.
Identifiers: *Sulfide oxidation, Upstream aeration, Aspirators, *Instream aeration, Venturi aspirated U-tubes, Oxygen transfer.

Field studies were conducted employing full scale prototypes of four aeration devices installed in a sanitary sewage collection system. The devices used included an in-line Venturi aspirator, an in-line Vortex Shear aspirator, an air lift pump, and Venturi aspirated U-tubes. Only the Venturi aspirated U-tubes proved to be satisfactory under the conditions of this study. The U-tube installed on the end of a sewage force main reduced dissolved sulfides, at a sampling station 1500 ft downstream, from .03 mg/l to .02 mg/l (equivalent to a 12 min detention). Additionally, the U-tube virtually eliminated the stripping of H2S in the discharge manhole where a severe odor problem and corrosive attack had existed. Oxygen demand in the force main immediately upstream of the U-tube averaged 2.5 mg/l. Oxygen transfer in the U-tube averaged 5.1 mg/l with residual dissolved oxygen in the effluent averaging 2.6 mg/l. As installed, and with oxygen transfer averaging 5.1 mg/l, no modification of existing pumps was required. Higher transfer concentrations approaching 7 mg/l were obtained with Venturi aspiration, but resulted in increased pump head requirements. Transfer concentrations up to 8 mg/l were obtained with forced air injection, but did not appear to justify the added cost of blowers and greatly increased pump head requirements. No maintenance was required on either of the two Venturi aspirated U-tubes during two years of continuous operation in this demonstration. This report was submitted in fulfillment of a grant to the Department of Sanitation, Jefferson Parish, Metairie, Louisiana. (EPA)
W73-14220

SLUDGE CONDITIONING USING SO2 AND LOW PRESSURE FOR PRODUCTION OF ORGANIC FEED CONCENTRATE,
Snell (Foster D.), Inc., Florham Park, N.J.
M. S. Weinberg, H. K. Weiss, A. L. Palanker, and A. L. Sheffner.
Available from the National Technical Information Service as PB-223 343, $10.50 in paper copy, $1.45 in microfiche. Environmental Protection Agency Report EPA-670/2-73-062, September 1973. 155 p, 11 fig, 119 tab, 11 ref. EPA Project 17070 EKN, Contract 14-12-813.

Descriptors: *Activated sluge, *Sewage treatment, *Sewage sludge, *Dewatering, *Sulfur compounds, Filtration, Chemical degradation, Municipal wastes, Sulfur dioxide, *Waste water treatment, Cost analysis.
Identifiers: Animal feed supplement, Reproductive performance, Nutritional value, Treatment costs, Teratogenic effects, Organic feed concentrates.

Activated sludge from four municipal sewage plants was treated with 0-5%SO2 at pressures of 50-100 psig. The filterability of the treated sludges was improved and the treatment solubilized from 26 to 44% of the initial insoluble solids. The clear, light yellow filtrates were concentrated and then spray-dried to flowable, hygroscopic, tan powders having nutritional value as an animal feed supplement. Capital investment and manufacturing costs for a plant producing 900 tons per year of a 50% concentrate or 450 tons per year of dry product was estimated at $223,000 and $273,000 with manufacturing costs of 6. 1 cent and 13.2 cent per pound respectively. Effects on reproductive per-

formance of this organic feed concentrate (OFC) were investigated in rats, rabbits and chickens using nutritionally balanced diets. No teratogenic effects were seen in rats or rabbits fed 5% or 10% OFC. No alterations in reproductive parameters wee noted in rats fed 5% OFC. Increased food intake and body weight gains were observed (5% OFC male and female rats) during the pre-mating feeding period. At 10% OFC levels, reduced Fertility, Viability and Lactationindexes were seen in rats and egg laying performance of chickens was suppressed. (EPA)
W73-14222

RENOVATING SEWAGE EFFLUENT BY GROUNDWATER RECHARGE,
Agricultural Research Service, Phoenix, Ariz. Water Conservation Lab.
Herman C. Bouwer, J. C. Lance, and R. C. Rice.
In: Proceedings, 16th Annual Water Conference, New Mexico Water Resources Research Institute, Las Cruces, March 25-26, 1971, p 32-46, 3 fig, 2 tab, 14 ref.

Descriptors: *Groundwater recharge, *Water reuse, *Hydrogeology, *Waste water treatment, Activated sludge, Biochemical oxygen demand, Chemical oxygen demand, Phosphates, Nitrates, Boron, Ammonia, Infiltration, Cost analysis, Pilot plants.
Identifiers: *Groundwater table, *Inundation, Fluorides.

Continued population growth in the Salt River Valley has stimulated interest in systems for reuse of municipal sewage effluent. Pilot plant studies of groundwater recharge of municipal activated sludge effluent were initiated in 1967. The secondary effluent contained 15 mg/l BOD, 50 mg/l COD, 25 ppm ammonia nitrogen as N, 13 ppm phosphate, and 4.5 ppm fluorides. The river bed, through which the water passed, was composed of 3 ft. of the fine loamy sand underlain by sand and gravel layers to great depth, with a groundwater table at about 10 ft. Water was pumped from one 30 ft. deep well in the center of the infiltration area, and from another well 1000 ft. from the center of the infiltration basins. Reclaimed water pumped from the well in the center of the infiltration area contained 0.5 mg/l BOD, 17 mg/l COD, no ammonia nitrogen for short (2-3 day) inundations and 40 to 80% less than influent NH3-N concentrations for 2 to 3 week inundations, 5 ppm phosphates, 2.5 ppm fluorides, and a median fecal coliform density of 10 per 100 ml. Concentrations of most constituents were further reduced by horizontal travel. Cost of the system was estimated at $5/acre-ft. with minimum underground travel distance and detention time of 500 ft. and 1 month respectively. Cost of conventional, in-plant tertiary treatment was reported as more than 10 times the estimate cost for groundwater recharge treatment. (See also W73-14224) (Lowry-Texas)
W73-14225

MATHEMATICAL SIMULATION OF AMMONIA STRIPPING TOWERS FOR WASTEWATER TREATMENT,
Federal Water Quality Administration, Cincinnati, Ohio. Advanced Waste Treatment Research Lab.
J. F. Roesler, R. Smith, and R. G. Eilers.
Available from National Technical Information Service, Springfield, Va., 22151 as PB-220 057, $3.00 in paper copy, $1.45 microfiche. FWQA Report, January 1970. 73 p, 17 fig, 3 tab, 27 ref. EPA Project 17090--1/70.

Descriptors: Water pollution, *Waste water treatment, Capital costs, *Sewage treatment, Operating costs, Maintenance costs, Sanitary engineering, Ammonia, Mathematical models, Simulation analysis, Model studies, *Tertiary treatment, *Cooling towers, *Computer programs.
Identifiers: *Ammonia stripping towers, Unit process models.

This computer program (FORTRAN, IBM 1130) can be used for preliminary design and cost estimation of ammonia stripping towers and cooling towers used in the treatment of wastewater. Crosscurrent and countercurrent tower configurations are included in the program. This mathematical model considers the effect of temperature drop thoughout the stripping tower. Capital and operation and maintenance costs are also calculated. (EPA)

WATER DISTRIBUTION AND WASTEWATER COLLECTION SYSTEMS IN FORSYTH COUNTY, NORTH CAROLINA WITH URBAN DEVELOPMENT FORECASTS: 1968-1978-2010.
City-County Planning Board, Winston-Salem, N.C.

July 1968. 52 p, 9 fig, 21 tab, 3 append.

Descriptors: *Water supply, *Waste water disposal, Sewage disposal, Septic tanks, Planning, *North Carolina, Treatment facilities, *Sewers, Utilities, *Waste water treatment, Urbanization, Cities.
Identifiers: *Utilities extension, Winston-Salem (N.C.), Forsyth County (N.C.).

The case for public sewers serving Forsyth County is built primarily upon potential health hazards of septic tanks throughout urbanizing areas. Time, increased density, and poor soils in developing districts will increase the danger of septic tank failure. Existing and programmed water supply programs are described, as well as existing waste water disposal systems. It is recommended that water not be provided to any areas in the absence of a wastewater disposal system. A unified county approach is urged for provision of these services. Because of the financial infeasibility of servicing outlying districts, the study urges that development in these districts be discouraged by strict utility policy and land regulations. The study defines and proposes an approximate public utilities district for the county, based on considerations of population projections and drainage patterns. Consideration is given to financing utilities extension. (Stein-North Carolina)

FEASIBILITY STUDY OF A NUCLEAR POWER-SEWAGE TREATMENT SYSTEM FOR THE CONSERVATION AND RECLAMATION OF WATER RESOURCES,
Arizona Univ., Tucson. Dept. of Civil Engineering and Engineering Mechanics.
R. A. Sierka.
Available from the National Technical Information Service as PB-223 501, $2.75 in paper copy, $1.45 in microfiche. Completion Report, August 1973. 12 p, 2 fig, 3 tab, 3 ref. OWRR A-028-ARIZ (2). 14-31-0001-3503.

Descriptors: *Waste water treatment, *Sewage treatment, Reclaimed water, *Thermal pollution, Nuclear Powerplants, *Activated carbon.
Identifiers: *Heated Sewage.

Seventy percent of the energy produced in a nuclear power reactor is rejected to the environment as low quality heat. One possible use of this heat source is for domestic wastewater treatment. This study examined a ferric-chloride, powered activated carbon and an aluminum sulfate, powered activated carbon physical-chemical system in a one-step process as a function of temperature (20-80C). COD, suspended solids, turbidity and phosphorus removals were used to monitor performance. Significant improvement in pollutant removals was obtained at higher temperatures with the optimum results occurring between 50 and 60C. Since urban wastewater flow and electric power usage are population-dependent and the system optimum treatment temperature coincides with waste heat characteristics, a combined power plant-wastewater system would generate recycle water.

PHOSPHORUS REMOVAL BY TRICKLING FILTER SLIMES,
Marquette Univ., Milwaukee, Wis. Dept. of Civil Engineering.
A. E. Zanoni.
Copy available from GPO Sup Doc as EP1.23/2, 73-279, $2.10; microfiche from NTIS as PB-223 534, $1.45. Environmental Protection Agency, Technology Series Report EPA-R2-73-279, July 1973. 122 p, 4 fig, 24 tab, 40 ref. EPA Project 17010 DZG.

Descriptors: *Phosphorus, *Biological treatment, Nutrients, *Slime, Minerals, *Waste water treatment, Equipment, Trickling filters, Nitrogen, Metabolism.
Identifiers: Attached growth, Synthetic media, Research apparatus.

A rotating disc apparatus was constructed so that disc speed could be varied. Organisms that developed on the disc surface, in response to various nutrient solutions, could be harvested and analyzed. Correlations were attempted between mineral composition of the feed solutions and the phosphorus and nitrogen content of the resulting slimes. An inclined channel apparatus was also constructed and evaluated to differentiate physical or chemical mechanisms from biological mechanisms of phosphorus uptake. The angle of inclination was used to measure the kinetic rates before and after inactivation of the biological slime with ultraviolet light. With the disc apparatus, limited success of inducing biological uptake of phosphorus, in excess of 1.5 to 2.5 percent of the cell mass, was obtained. Statistical analysis of the data indicated that those values above 2.5 percent usually were encountered when the medium contained calcium salts. Results from the inclined plane growth chamber showed that the limited phosphorus uptake that did occur could be related to metabolic activity rather than physical sorption or chemical precipitation. (EPA)

PRESSURE FILTRATION OF WASTE WATER SLUDGE WITH ASH FILTER AID,
Cedar Rapids Water Pollution Control Plant, Iowa.
J. W. Gerlich.
Copy available from GPO Sup Doc as EP1.23/2, 73-231, $2.10; microfiche from NTIS as PB-223 535, $1.45. Environmental Protection Agency, Technology Series Report EPA-R2-73-231, June 1973. 153 p, 64 fig, 14 tab. EPA Project 11060 EZX.

Descriptors: Sludge, *Dewatering, *Iowa, *Sludge treatment, Filters, *Waste water treatment, Pressure, *Filtration.
Identifiers: Ash filter aid, *Pressure filtration, Cedar Rapids (Iowa).

Cedar Rapids, Iowa used pilot plant studies as an effective approach to an economic solution to dewatering secondary digested sluge After piloting several dewatering processes, the pressure filter system was selected and a full scale plant was constructed. During the course of the dewatering studies it was observed that fly ash was an effective filter aid. The full scale plant was designed to utilize sludge ash from incinerated filter cake, as well as power plant fly ash. The design capacity is 28 tons of dry sewage solids for 16 hour operation at 48 percent dry solids cake. Performance data from the full scale plant were evaluated over a period of approximately nine months. Both fly ash and sludge ash were evaluated as a filter aid, with and without chemicals. Economic evaluations were made of operation and equipment. Some conclusions are: (1) Pressure filtration of waste water sludges is an effective and economical process. (2) Ash filter aid increases dewatering production and decreases chemical costs. Sewage sludge ash from an incinerator can be recycled to process; power plant fly ash is even more effective sludge conditioner. (3) A detailed pilot plant program is of great value in design of a full scale plant. (4) Some chemicals in combination with ash filter aid further improve dewatering efficiencies. (EPA)
W73-14374

REVERSE OSMOSIS FOR WASH WATER RECOVERY,
Envirogenics Systems Co., El Monte, Calif.
R. W. Lawrence.
Available from the National Technical Information Service as PB-220 389, $1.45 in microfiche. Office of Saline Water Research and Development Progress Report No. 848, May 1973. 24 p, 4 fig, 6 tab. OSW contract 14-30-2815.

Descriptors: *Water reuse, *Reverse osmosis, *Water purification, Separation techniques, Membranes, Pressure, Water treatment, Detergents, Flocculation, *Pre-treatment (Water), *Waste water treatment, Recovery, Filtration.
Identifiers: Wash water, Laundry wash water, Spiral module, Wash water analysis, Alum flocculation, Cellulose acetate membranes.

A 34-day run was made at 165F under an operating pressure of 800 psig with the synthetic wash water containing 1000 ppm sodium lauryl suflate. The flux decline parameters were 0.17 and 0.067 for blend and cellulose acetate methacrylate (CAM) membranex, respectively, and the extrapolated flux at six months were 13 and 19 gfd, respectively. The rejections obtained with blend and CAM membranes were low for urea (37 to 46%), strongly pH dependent for lactic acid (84 to 98%), good for sodium lauryl sulfate (92 to 98%) and excellent for sodium chloride (99.4% for blend membrane and 98.9% for CAM membrane). Many tests on the bacterial content of the product water and the recycle stream when operating at 165F showed that they were sterile. This proved to be true for both synthetic and real wash water. A 2-in. dia. by 22-in. spiral module containing 4.5 sq ft of blend membrane was operated satisfactorily for 30 days at 165F, 400 psig, and 64-77% product recovery. The membrane support was stiffened by the use of Mylar sheet between two pieces of Dacron-tricot substrate. Pretreatment of the wash water consisted of filtration through 30, 23 and 0.45 micron fulted filters. Sulfuric acid was added periodically to keep the pH between 6 and 8.5. Increasing the flow rate from 0.5 gpm to 0.9 gpm daily aided maintaining product flux, which was initially 12.0 and 6.5 gfd at the end of 30 days operation. (OSW)

A PILOT PLANT INVESTIGATION OF THE PULSED ADSORPTION BED PROCESS,
Iowa State Univ., Ames.
S. R. Sedgewick.
Master's Thesis, 1969, 138 p, 37 fig, 12 tab, 13 ref.

Descriptors: *Adsorption, *Tertiary treatment, *Organic loading, Efficiencies, Biodegradation, Separation techniques, Colloids, *Pilot plants, *Waste water treatment
Identifiers: *Pulsed adsorption beds, Hydraulic loading, *Total organic carbon, Suspended solids

A pulsed adsorption bed (PAB) pilot plant was operated for 82 days to determine (1) the relationship between influent total organic carbon and removal efficiency at various hydraulic loadings, (2) if a relationship exists between influent soluble fraction and hydraulic loading; and (3) if relationships exist between removal efficiency of the influent solid plus colloidal fraction and hydraulic loading. Organic loadings of 97, 161, and 223 lb BOD applied/1000ft3/day at respective hydralic loadings of 0.70, 1.15 and 1.60 gpm/ft2 were applied to the system. For both the total and colloidal plus suspended samples, highest total organic removal efficiency was obtained at the lowest hydraulic loading rate investigated and conversely, while removal efficiency for the soluble fraction was essentially constant at all hydraulic loadings. In addition, the non-biodegradable fraction of the waste appeared to increase with increased hydraulic loading. Overall, an increase in removal efficiency was shown to occur with an increase in influent concentration, with such increase being highly dependent upon the concentration of the non-degradable portion of the influent. Areas requiring further study include relationships between removal efficiency and both bed depth and air flow rate, as well as cost estimates. (Lowry-Texas)

INFLUENCE OF SURFACE OXIDES ON ADSORPTION AND CATALYSIS WITH ACTIVATED CARBON,
Maryland Univ., College Park. Dept. of Civil Engineering.
C. Ishizaki, and J. T. Cookson, Jr.
Available from ACS-Div of Water, Air and Waste Chem., Publications Manager, Mellon Inst., 4400 Fifth Aven., Pittsburgh, Pa. 15213, Price $4.00. In: Preprints of Papers Presented at 165th National Meeting of American Chemical Socieyt, April 8-13, 1973, Dallas, Tex: American Chemical Society, Division of Water, Air and Waste Chemistry, Vol 13, No 1, Paper 53, p 51-53, 1973.

Descriptors: *Adsorption, *Water treatment, *Organic compounds, *Activated carbon, Water purification, *Waste water treatment, Organic wastes.
Identifiers: Mercaptans, Disulfides, Hydrocarbons.

The influence of surface oxides is evaluated for the adsorption of several organics on Filtrasorb 200, an activated carbon. The absorbates include p-hydroxybenzaldehyde (representative of degradation products of larger color-producing compounds), n-butyl mercaptan and butyl disulfide (paraffinic molecules found responsible for taste and odor problems in water), decane (a nonpolar molecule), and glycine (a polar compound). The surface of the carbon, originally basic in nature, is modified by outgassing followed by dry oxidation at several temperatures. Equilibrium as well as kinetic studies were performed in batch systems. For all the adsorbates studied the equilibrium can be described by the Langmuir equation. The monolayer coverages are in the order of a few millimoles per square meter. The activated carbon was found to catalyze the oxidation of n-butyl mercaptan to butyl disulfide. A mechanism is proposed to explain this catalytic effect. The rates of adsorption are studied for all the

adsorbates. The presence of acidic surface oxides strongly hinders the adsorption of decane and butyl disulfide, but it does not seem to influence the adsorption of the aromatic. (Knapp-USGS)

THE DISINFECTION OF SEWAGE BY CHLOROBROMINATION,
Dow Chemical Co., Midland, Mich. Hologens Research Lab.
J. F. Mills.
Available from ASC-Div of Water, Air and Waste Chem., Publications Manager, Mellon Inst., Fifth Ave., Pittsburgh, Pa. 15213, Price $4.00. In: Preprints of Papers Presented at 165th National Meeting of American Chemical Society, April 8-13, 1973, Dallas, Tex: American Chemical Society, Division of Water, Air and Waste Chemistry, Vol 13, No 1, Paper 71, p 65-75, 1973. 3 fig, 2 tab, 10 ref.

Descriptors: *Bromine, *Bromides, *Disinfection, *Sewage treatment, *Waste water treatment, Toxicity, Fish.
Identifiers: *Bromamines, *Chloramines.

The chemical and biocidal properties of bromine chloride and the instability of bromamines in sewage make chlorobromination an attractive alternative to chlorination and a potential solution to this problem. In comparing chlorination and chlorobromination of secondary sewage effuent versus nitrified secondary sewage effluent, the effects of ammonia concentration, pH, temperature, halogen dosages, and halogen demand are important factors influencing both biocidal activity and fish toxicity. Some of the conclusions are: BrCl forms less stable bromamine residuals; BrCl shows higher biocidal activity without fish toxicity hazards: BrCl is more effective over a wider pH range; and BrCl has advantageous chemical and physical properties (higher solubility and lower volatility). HAZARDS ASSOCIATED WITH THE USE OF CHLORINATED OXIDATION POND EFFLUENTS FOR IRRIGATION,
Technion - Israel Inst. of Tech., Haifa.
Y. Kott.
Water Research, Vol 7, p 853-862, 1973. 7 tab, 17 ref.

Descriptors: *Chlorination, Effluents, Hazards, *Irrigation water, *Oxidation lagoons, Water quality control, *Water reuse, Water treatment, *Waste water treatment.
Identifiers: *Israel.

In Israel more than 200 oxidation ponds are in use, most of them serving rural communities. It is natural to assume, therefore, that in a country where about 90 percent of the water resources are utilized, most of the oxidation pond effluents will be used for irrigation. Reuse of wastewater for agricultural purposes is dependent on health hazards being overcome. Investigations using 8 miligrams per litre chlorine applied to oxidation pond effluents caused no algal kill within the first 2 hours of contact. Available chlorine attacks bacteria, causing coliform count to drop from 100,000 per 100 ml to a few tens. Enterovirus counts dropped from about 80 per 100 ml to 37 per 100 ml after chlorination. Vibro cholerai (El-Tor) were killed under these conditions, and MPN dropped from 1000 per 100 ml in the influent wastes to 2 per 100 ml in the effluents. A 5 mg per l dose of chlorine at 1 h contact time killed these sensitive bacteria, decreasing MPN to less than 2 per 100 ml. Differences between the efficiency of chlorination experiments under laboratoryand field conditions would necessitate the application of 15 mg per l chlorine for 2 h of contact. Further study is needed before unrestricted use of oxidation pond effluents for irrigation purposes is safe unless strict regulations are issued. (Bahre-Arizona)

WATER, SEWER, AND STORM DRAIN STUDY, UTAH COUNTY, UTAH, VOLUME I: BACKGROUND AND INVENTORY.
Despain (I. Dale) and Associates, Provo, Utah.

Prepared for Utah County Council of Governments, September 1972. 238 p, 34 maps, 97 tab.

Descriptors: *Water supply, *Sewerage, *Water demand, *Urban land use, *Storm drains, Planning, Water quality, Urbanization, Waste disposal, Governmental interrelations, Inter-Agency cooperation.
Identifiers: *Utility extension, *Utah County (Utah), Provo (Utah), Utah Valley (Utah), Four Corners Economic Development Region.

The purpose is to assess the adequacy of existing water, sewage, and storm water systems and facilities throughout Utah County and to demonstrate the most cost effective method of providing water, sewer and storm drain service to the present and future inhabitants, consistent with its adopted Land Use Plan. This area of 1,370,240 acres in north central Utah, including 92,000 acres of water surface represented by Utah Lake, lies almost entirely within Utah Lake-Jordan River drainage basin. Most agricultural and urban development and 99.7 percent of the population of 145,000 has been concentrated in Utah Valley, the territory between the base of the Wasatch Mountains on the east and Utah Lake on the west. More than 45 percent of total land area is owned or managed by a federal, state or local governmental agency. Control of nearly 38 percent of the land area is shared by the Forest Service and the Bureau of Land Management. This volume is concerned with background data on soils, population trends and projections of future urban trends in housing, commerce and industry. The major portion of this report is devoted to maps and inventories of water and sewer systems for individual communities plus an inventory of storm water facilities. (See also W73-14493) (Edwards-North Carolina)
W73-14492

WATER, SEWER AND STORM DRAIN STUDY, UTAH COUNTY, UTAH: VOLUME II, PLAN REPORT.
Despain (I. Dale) and Associates, Provo, Utah.

Prepared for Utah County Council of Governments, September 1972. 228 p, 38 fig, 71 tab, append.

Descriptors: *Planning, *Water supply, *Sewerage systems, *Storm drains, Coordination, Drainage systems, Water supply development, Canyons, Utah.
Identifiers: *Utah County (Utah), Cedar Valley (Utah), Wasatch Front Canyons (Utah), Water control.

Key elements are detailed individual plans for the 16 municipalities and other developing areas in the county, which are coordinated into one master plan. The basic goals and criteria used in formulating the plan are summarized. Evaluated are present water, sewer, and storm drain facilities, as well as a projection of future needs. Major improvement projects and programs, coupled with their priority rating, are listed. Primary responsibility for implementation rests with the individual municipalities, although the creation of an implementation organization within the Utah Council of governments is recommended in order to promote cooperative action among municipal units. A selected summary of domestic water standards and waste water standards for the state of Utah is included. (See also W73-14492) (Hoffman-North Carolina)
W73-14493

AMARILLO, TEXAS: REPORT ON SANITARY SEWERAGE AND SEWAGE TREATMENT, 1967.
Freese, Nichols and Endress, Fort Worth, Tex.

March, 1968. 59 p, 1 fig, 2 append.

Descriptors: *Sewerage, *Sewage treatment, *Sewage disposal, *Interceptor sewers, *Effluents, Design criteria, Costs, Planning, Waste treatment, *Texas.
Identifiers: Capital improvements, *Amarillo (Tex).

Focus is on three elements of the sanitary sewerage system, collection facilities, treatment plants, and the disposal and/or reuse of treated effluent. Each element is analyzed in terms of the existing situation and future requirements. Improvements are recommended for each element via detailed schedules which include projected cost estimates. Recommendations include new collection facilities for urbanizing fringe areas, the expansion of the two treatment plants, and continued use of treated effluent for industrial and agricultural purposes. The report is engineering oriented, emphasizing detailed projects up to 1972, and includes proposed improvements that are likely to be needed for 5-year intervals to 1990. A discussion of population trends and design criteria provides a basis for the analysis. (Elfers-North Carolina)

A NEW CONCEPT FOR OPERATOR WAGES,
Water Pollution Control Federation, Washington, D.C.
J. A. Voegtle, and F. I. Vilen.
Journal Water Pollution Control Federation, Vol 45, No 2, p 203-209, 1973. 7 tab.

Descriptors: Waste water treatment, *Compensation, *Wages, *Wisconsin, Analysis, *Cost analysis.
Identifiers: *Waste water treatment operators, Comparative wage analysis.

In order to estimate the fair compensation to a wastewater system operator a pilot study was performed with the aid of a questionnaire distributed at the Wisconsin Wastewater Operators Conference. Ten work functions were derived from data recording operator time spent in 25 different work categories for an uninterrupted six-week period. In addition, general information concerning operator credentials, experience, and responsibilities were gathered by the survey. Wage information applicable to the various work categories was gathered from the Wisconsin State Employment Service. Analysis indicates that operator wage rates are less than the total of the current rates for work in occupations corresponding to the work categories multiplied by the percentage of time spent in performing similar duties. The indication is that the operator is receiving a wage due to a man with a variety of diluted skills as represented by the work categories. One cause of this might be the application of the title 'operator' to all levels of experience and combinations of

technical skills. More specifically descriptive job titles are recommended. (Weaver-Wisconsin)

PRICETAG TO INDUSTRY,
Hazen and Sawyer, New York.
C. R. Walter.
Water and Wastes Engineering, Vol 10, No 1, p A13-A14, 1973.

Descriptors: *Industrial wastes, *Waste water treatment, *Use rates, Pricing, Sewage treatment, *Pollution taxes (Charges).
Identifiers: Flow charges, Surcharges, Municipal sewage systems, Waste strength.

Methods for determining fees for the treatment of industrial wastes discharged into municipal sewerage systems are discussed. Total revenues needed to support the municipal sewerage utility are calculated from all costs associated with the operation, maintenance and management of the system and treatment facilities; sewerage service charges are based on these costs which are allocated against users and properties in proportion to the benefits received. Various types of charges are levied, however the most common fee is based upon the volume of flow contributed to the system with a possible supplemental surcharge for treatment of exceptionally strong wastes. Although such surcharges are theoretically appealing they are often politically intractable as well as difficult and costly to establish. If combinations of flow charges and strength surcharges are adopted, plant expenses should be allocated to three cost-of-service components--volume costs, strength costs, and customer costs. Using this accounting scheme, the most equitable schedule of charges may be calculated. For the benefit of the local economy, industry located outside municipal boundaries should be served. Long-term contracts between cities and industries protect the city's financial stability. (Weaver-Wisconsin)

REPORT ON SANITARY SEWERS IN KANSAS CITY, KANSAS, 1973,
Kansas City Engineering Dept., Kans.
G. C. Clark.
1973. 45 P, 1 FIG.

Descriptors: *Separated sewers, *Sewerage, *Construction, Kansas, Forecasting, Sewers, City planning, Programs, Project planning, Planning.
Identifiers: *Kansas City (Kansas), *Sanitary sewers.

Expected growth in Kansas City, Kansas will require additional sewers and sewage treatment. In 1970, the City occupied an area of 58.5 acres, while at the end of 1972 it covered 109 square miles. Although a large portion of this area is currently undeveloped, the construction of an interstate highway is expected to cause rapid growth. The city is divided by a ridgline, creating a necessity for two sewer systems and two additional treatment plants; one on the Missouri River (to the south), and the other on the Kansas River. A master plan for the construction of the two plants and 40 miles of trunk sewers is presented. Forty-five projects are listed to provide sewers and sewage treatment plants. Cost is put at $27,170,440, of which federal and state grants should cover all but $6,435,143 for the 3-year program. (Poertner)

Descriptors: *Water reuse, *Return flow, Furrow irrigation, *Irrigation effects, *Soil properties, Pulp and paper industry, *Pulp wastes, Domestic water, Industrial water, Irrigation water, Salinity, Salts, Leaching, Alkalinity, Permeability, Model studies.
Identifiers: USSR, Poplar trees, Solonetzization, *Astrakhan SSR.

Waste water from pulp and paper industries cannot be discharged into natural bodies of water without preliminary treatment. The use of a mixture of domestic and industrial waste water from the Astrakhan' Cellulose and Pasteboard Combine to irrigate stands of specially bred, rapidly growing poplar on Brown Desert-Steppe soils resulted in partial desalinization of saline soils in the first few years, while more rapid desalinization occurred when the same soils were irrigated with Volga water. Desalinization of variously textured Brown Desert-Steppe soils after irrigation with domestic waste water resulted in a 33% to 92% increase in total alkalinity and in the appearance of or increase in alkalinity from normal carbonates, as well as in a 5% to 16% increase in the degree of soil solonetzicity. The rate of soil solonetzization varies with soil texture and rates of irrigation-water application and absorption. Solonetzization in soil surface layers of irrigated furrows caused a sharp decrease in permeability (by a factor of 1.3 to 1.5). Occurrence of solonetzization in soils irrigated with domestic waste water was confirmed in a model experiment. To improve absorption of irrigation water by poplar, temporary furrows should be used. (Josefson-USGS)
W73-14601

EFFECTS OF TREES AND FORESTS IN NEUTRALIZING WASTE,
Pennsylvania State Univ., University Park. School of Forest Resources.
W. E. Sopper.
Trees and Forests in an Urbanizing Environment, March 1971, 15 p, 3 fig, 15 tab, 48 ref. Pennsylvania Institute for Research on Land and Water Resources, Reprint Series No. 23. OWRR B-020-PA (11).

Descriptors: *Waste water disposal, *Irrigation, *Municipal wastes, *Water reuse, *Forests, Nitrogen, Phosphorus, Nitrates, Performance, Groundwater recharge, Trees, Growth rates, Industrial wastes, Water conservation.
Identifiers: *Site conditions.

The living-filter system for renovation and conservation of municipal waste water is feasible wherever you have the following site conditions: (1) Soil with an infiltration and percolation capacity sufficient to accommodate applications of waste water at recommended rates. Soil permeability must be high enough to permit drainage of the renovated effluent and to maintain aerobic soil conditions. In this respect, forests are particularly suitable, since most forest soils are very porous and have higher infiltration and percolation rates than tilled agricultural land. In addition, most forest soils remain porous during the winter season. (2) Soil with sufficient chemical-adsorptive capacity, water-retentive capacity, and depth to the groundwater table to temporarily retain dissolved minerals for use by the vegetative cover and microorganisms and thus prevent groundwater contamination. (3) Low relief with a vegetative cover and a protective accumulation of surface organic matter to prevent and minimize surface runoff, particularly during the winter months. (4) A groundwater aquifer with a fairly deep water table to accommodate subsequent changes in groundwater storage, and with sufficient horizontal permeability to allow for adequate lateral displacement of the renovated waste water. (Galwardi-Texas)

SPRAY IRRIGATION OF SEWAGE EFFLUENT AND SLUDGE,
Pennsylvania State Univ., University Park. School of Forest Resources.
W. E. Sopper.
In: Proceedings, First National Conference on Composting-Waste Recycling, Rodale Press, Emmavs, Pennsylvania, September 1971, p 65-78, 17 tab, 13 ref. Pennsylvania Institute for Research on Land and Water Resources Reprint Series No 27. OWRR B-020-PA (12).

Descriptors: *Waste water disposal, *Irrigation, *Municipal wastes, *Water reuse, *Forests, Nitrogen, Phosphorus, Nitrates, Performance, Groundwater recharge, Trees, Grasses, Legumes, Growth rate, Water conservation, Revegetation.
Identifiers: Acid mine spoil banks, *Spray irrigation.

Eight years of research have indicated that the living filter system for renovation and conservation of municipal waste water is feasible and that com-

binations of agronomic and forested areas provide the greatest flexibility in operation. Such a system is more adaptable to small cities and suburbs than to large metropolitan areas because of the availability of open land close to the waste water treatment plant, although the land area requirement is not a major prohibitive factor. At the recommended level of irrigation, 2 inches per week, only 129 acres of land would be required to dispose of 1 million gallons of waste water per day. Although large contiguous blocks of agricultural and natural forest land would be the most desirable for efficiency and economy, major metropolitan areas could utilize golf courses, playing fields, forest preserves and parks, greenbelts, scenic parkways, and perhaps even divided highway and beltway medial strips. Preliminary results after two years of research also indicate that municipal waste waters might also be used to reclaim and revegetate many of the barren bituminous strip-mined spoil banks existing throughout the Appalachian region and restore them to a more esthetic and productive state. (Galwardi-Texas)
W73-14612

A SYSTEMS APPROACH TO SOLID WASTE MANAGEMENT IN ASIA: BANGKOK, THAILAND, AS A CASE STUDY,
Asian Inst. of Tech., Bangkok (Thailand). Dept. of Environmental Engineering.
R. J. Frankel, and E. A. R. Ouano.
In: Systems Approaches to Developing Countries, Proceedings of Symposium, sponsored by International Federation of Automatic Control and the International Federation of Operational Research Societies, Algiers, Algeria, May 28-31, 1973, p 247-253, 1973. 5 fig, 1 tab, 3 ref.

Descriptors: *Solid wastes, *Management, *Evaluation, *Systems analysis, Simulation analysis, Linear programming, Optimization, Waste disposal, Waste treatment, Economics, Mathematical models.
Identifiers: *Thailand (Bangkok), Asia, Waste collection, Cost sensitivity.

A study which presents a systems approach for handling solid waste porblems in the Asian environment, using Bangkok as a case study is reported. The systems approach accounts for the interdisciplinary nature of solid waste management and permits for systematically dividing the problem into specialized sub-problems which can be handled by more comprehensive techniques. In this study, variables and parameters that affect the effectiveness of solid wastes collection, treatment and disposal in Bangkok were analyzed. A field study was conducted to measure the values of the collection system, to quantify the stochastic nature of the parameters, and to determine the efficiency of present crew utilization. A computer simulation model was developed to quantify the interactions of variables in the collection system. The model was verified using current operation data. A sensitivity analysis using variations in crew size, truck volume, type of container and alternative means of disposal was performed using the simulation model. Linear programming techniques were employed to determine the least cost alternative or optimum combination of alternatives regarding choice of site for facilities for treatment and disposal. Recommendations for improving the present system were made given the social and economic constraints existing in Bangkok. Comparison of the solid waste management practices in Bangkok, Manila, and Hong Kong was made to extend the usefulness of the developed methodology to other Asian cities. (Bell-Cornell)

ZERO DISCHARGE - THE ULTIMATE IN WATER CONSERVATION,
Battelle Inst., Geneva (Switzerland). Chemical and Environmental Engineering Systems Div.
J. C. Shorrock, and M. G. Royston.
British Water Supply No. 3, p 12-16, March 1973. 1 fig.

Descriptors: *Recycling, *Waste water treatment, Water treatment, Fermentation, *Water reuse, *Water conservation.
Identifiers: *Zero discharge, Residuals management.

Zero discharge refers to a goal for water-use systems in which all wastes are resources which can be used. It is based on a concept of finite resources. It is recommended that all bodies using water should develop a conceptual zero-discharge strategy and use this as a long-range planning tool for fixing realistic targets, planning future systems, and for the allocation of priorities to research and development objectives. The alternative approach is seen as playing a passive role, waiting to be forced into taking action by authorities. Steps in establishing a zero-discharge strategy are (1) inventorying water consumption item by item and listing positive means to be adopted to limit consumption to minimum levels required by each process stage, (2) defining qualities of water required, and (3) establishing treatment levels for recycle of water. Systems for upgrading dissolved pollutants are fermentation, evaporation and distillation, reverse osmosis, chemical precipitation, filtration and decantation, and electrochemical processes. (Stein-North Carolina)
W73-14684

ENVIRONMENTAL PROTECTION: NEW NAVY DUTY,
A. J. Ogrinz, III.
Environmental Science and Technology, Vol 7, No 1, p 26-29, January 1973. 2 fig.

Descriptors: *Ships, *Harbors, *Sewage treatment, *Oil spills, Radioactivity, Water pollution control, Submarines, *Pollution abatement, Waste disposal.
Identifiers: Shipboard wastes, Holding tanks, Recirculating flush systems.

Importance of environmental planning has been officially recognized by the U.S. Navy by creation of an Environmental Protection Division, awards for outstanding performance in protection of the environment and initiation of a series of studies in pollution control research. An electro-mechanical incinerator system to treat shipboard sewage has been developed by Fairbanks-Morse Research Center, Pittsburgh. Also holding systems and recirculating flush systems have been studied with holding tanks favored by preliminary evaluation. A prototype sewage disposal system on submarine tender Fulton has 3 parts: (1) on-board sewage teatment plant collects and incinerates the Fulton's sewage, (2) all other wastes are collected by internal manifold and transferred ashore, (3) a third system transfers sewage from submarines which come alongside for repair. Lack of radioactivity above normal background levels in harbors where naval nuclear-powered ships are based indicates no additional plans or procedures necessary. A mandatory design change which reroutes storage tank overflow lines in ships to a series of tanks equipped with an overflow alarm may reduce the number of oil spills per refueling. Long range goals envision all wastes--sewage, oil, solids, etc. disposed of ashore when in port thus halting discharges of oil into ocean water. Navy's environmental program funding has been virtually without opposition. Benefits of an effective environmental program are: (1) cleaner environment, (2) improved international image for U. S., (3) better cooperation with private industry for cleaner harbors. (Stein-North Carolina)

WASTE TREATMENT SYSTEM,
J. D. Brown.
U. S. Patent No. 3,749,243, 4 p, 5 fig, 5 ref; Official Gazette of the United States Patent Office, Vol 912, No 5, p 1807, July 31, 1973.

Descriptors: *Patents, *Waste water treatment, Equipment, *Aeration, Pollution abatement, Water quality control, Water pollution control.

Dual clarifiers selectively receive an inflow of effluent, through the operation of a switch gate, from a pressure tank where the effluent is mixed with air and certain chemicals. The clarifiers incorporate upper and lower skimming and sludge removal raking apparatus. The rakes remove the solids to discharge flow lines entering a central sludge reservoir. The remaining liquid moves through flow lines into a vertical aerator tank where it is subjected to pressure aeration. The air is dispersed through the liquid effluent and partially dissolved with the subsequent passage of the effluent to one of the clarifiers. The system is to incorporate automatic controls which include a limit switch mounted on the lip of the skimmer trough associated with each clarifier. The switches sense the attainment of a specific effluent level and are automatically activated to divert inflowing effluent to the proper clarifier. Flow from clarifier to aerator is also automatically regulated. (Sinha-OEIS)

SACRIFICIAL ELECTRODE SYSTEM FOR REMOVAL OF HEAVY METAL IONS FROM WASTE WATER,
Nalco Chemical Co., Chicago, Ill. (assignee)
E. E. Johnson, R. N. Buggs, and R. L. Kornmann.
U. S. Patent No. 3,748,240, 2 p, 4 ref; Official Gazette of the United States Patent Office, Vol 912, No 4, p 1523, July 24, 1973.

Descriptors: *Patents, *Waste water treatment, Metals, Electrodes, Cathodes, *Electrolysis, *Ions, *Heavy metals, Pollution abatement, Water pollution control, Water quality control, *Mercury (Metal), Silver, Lead, Cadmium, Copper.
Identifiers: Acid, Insoluble sulfides.

A method and an electrode cell system are discussed for the removal of certain heavy metal ions in solution especially from waste water. The process consists of precipitating the ions at a pH below 7 as an acid insoluble sulfide. The ions are electrolized in a carbon/carbon electrode cell system. The sacrificial cathode contains 20-80% cathode weight of elemental sulfur. Six examples are presented. The system is particularly applicable to the removal of mercury ions to form mercury sulfide and mercury bisulfide. It is also applicable to heavy metals ions such as silver, lead, cadmium, and copper. These can form acid insoluble sulfides which then can be centrifuged or filtered and removed from the system. (Sinha-OEIS)
W73-14693

BATCH SEWAGE TREATMENT SYSTEM AND METHOD,
BioPure, Inc., Tualatin, Oreg. (assignee)
L. R. Gensman, and J. R. Nunn.
U. S. Patent No. 3,746,638, 6 p, 3 fig, 8 ref; Official Gazette of the United States Patent Office, Vol 912, No 3, p 1057, July 17, 1973.

Descriptors: *Patents, *Sewage treatment, *Waste water treatment, Equipment, *Aerobic treatment, Pollution abatement, Water quality control, Water pollution control, Aeration.

Incoming sewage is mixed and aerated continuously (or intermittently under low flow conditions) and withdrawn in batches for clarification and discharge. A basket having open mesh side and bottom walls is partly submerged in the mixed aerated sewage. A portion of the aerated mixed liquor is circulated through the basket to cause aerobic digestion and hydraulic erosion. Batches

of mixed liquor are intermittently pumped into a settling chamber in excess of the amount filling the settling chamber. The excess is discharged back into the aeration chamber over a weir and acts to skim floating sludge back into the aeration chamber. The resulting batch thus withdrawn from the aeration chamber is settled in the settling chamber under quiescent conditions. A part of the settled batch, specifically supernatant liquor taken from below the top scum layer, is then delivered to a discharge chamber. It is further settled and the resulting supernatant liquor discharged. Settled sludge and floating scum from the settling and discharge chambers are returned to the aeration chamber by pumps which completely empty these chambers. (Sinha-OEIS)

SELECTIVE MULTI-STAGE FILTRATION SYSTEM,
R. Nebolsine, and G. San Roman.
U. S. Patent No. 3,746,172, 3 p, 2 fig, 1 ref; Official Gazette of the United States Patent Office, Vol 912, No 3, p 944, July 17, 1973.

Descriptors: *Patents, *Waste water treatment, *Filtration, *Oil wastes, Oily water, *Oil pollution, Equipment, Pollution abatement, Water pollution control, Water quality control.

This filtration system consists of inter-connected filter units, each being adapted to use one or more filter media and operated at its own rate and also having its own back-wash cycle. In the treatment oily waste water or other fluid enters an initial unit referred to as an oil separator. An interceptor is connected to an oil outflow pipe for removal of oil for storage. The interceptor also has a discharge pipe at its base for passage of sludge to discharge tank. (Sinha-OEIS)
W73-14696

SLUDGE SEPARATION SYSTEMS EMPLOYING REFRIGERATION MEANS,
Carrier Corp., Syracuse, N.Y. (assignee)
F. B. Neyhart, and J. S. Styron.
U. S. Patent No. 3,745,782, 5 p, 1 fig, 3 ref; Official Gazette of the United States Patent Office, Vol 912, No 3, p 847, July 17, 1973.

Descriptors: *Waste water treatment, *Patents, *Water treatment, Potable water, Water quality control, Freezing, Condensation, *Heat exchangers, *Refrigeration, *Sludge treatment, Separation techniques.
Identifiers: Alum.

An apparatus for promoting separation of the solid and liquid constituents of a sludge is provided with a pair of identical falling film heat exchangers which alternately serve as a refrigerant evaporator and refrigerant condenser. The refrigeration system is provided to freeze sludge in one heat exchanger by evaporating the refrigerant on the exterior of the heat exchange tubes. The evaporated refrigerant is compressed and condensed on the exterior of the tubes in the other heat exchanger. Recirculation for sludge is provided to continuously cool and solidify a thin film of the sludge descending in the heat exchange tube of one heat exchanger and a similar recirculation is provided for recirculating cooling medium. The refrigeration system is systematically reversed, using the cooling capacity of the frozen sludge in the heat exchange tubes of one of the heat exchangers to condense refrigerant while freezing sludge. (Sinha-OEIS)
W73-14697

MARINE SEWAGE COLLECTION AND DISCHARGE SYSTEMS,
K. F. Kennedy.
U.S. Patent No 3,703,960, 4 p, 7 fig, 2 ref; Official Gazette of the United States Patent Office, Vol 904, No 4, p 518, November 18, 1972.

Descriptors: *Waste water treatment, *Patents, *Sewage treatment, Treatment facilities, Boats, *Domestic wastes, *Sewage disposal, Pollution abatement, Water pollution control, Water quality control.
Identifiers: Waterfront facilities.

Sewage at waterfront facilities where houseboats, boats and ships are moored and/or stop for service is collected in a system supported by the facilities such as docks and floats and then pumped into a shore system. The system is designed to be responsive to water motions caused by watercraft, wind, waves, and tides. The partially submerged collection tanks are often comprised of multiple sections of sewer pipes sealed together and then capped at the remaining open ends. Sewage from the waterfront facilities is directed through flexible couplings and collection pipes, arranged on grade, into partially submerged holding tanks. Each tank is equipped with pumping apparatus to periodically discharge sewage into pipes leading to a sewage system ashore. (Sinha-OEIS)
W73-14701

IMPROVED CROSS-FLOW FILTRATION PROCESS FOR REMOVAL OF TOTAL ORGANIC CARBON AND PHOSPHATES FROM AQUEOUS SEWAGE EFFLUENTS,
K. A. Kraus, and H. A. Mahlman.
U. S. Patent Application Serial No 200,840 (70), November 22, 1971. 14 p, 3 fig, 5 tab.

Descriptors: *Patents, *Waste water treatment, *Filtration, Water pollution control, *Sewage treatment, *Organic compounds, *Phosphates, Pollution abatement, Water pollution control.

A cross-flow filtration process is described for the removal of total organic and phosphate content of aqueous sewage effluents. An additive selected from powered carbon, a salt of hydrous metal oxide, or the hydrous oxide is included in an aqueous feed sewage in small but effective amounts. The mixture is pumped through a filter unit of the internal or external flow-through type at a pressure and velocity sufficient to effect cross-flow filtration. Typical presures used experimentally were in the range 3 to 100 psi and cross-flow velocity in the range 2 to 30 ft/sec. Several modes of cross-flow filtration are set forth. The filtering medium comprises a porous substrate material having pores of from 5 to as much as 200 microns in size aided by an inert filter aid material deposited on the feed side of the substrate material. The substrate material may comprise flexible, pressure-resistant fire hose jacket for example, made from polyester warp with nylon filler; stainless steel or other metal screening; nylon, polyester or other synthetic screens; and porous ceramic or carbon. The filter aid may be selected from such material as diatomaceous earth, perlite, asbestos fiber, cellulose fiber, silica gel, and carbon fiber or powder. Six examples and test results are given. (Sinha-OEIS)

EVALUATION OF TREATMENT FOR URBAN WASTEWATER REUSE,
Colorado Univ., Boulder. Dept. of Civil and Environmental Engineering.
K. D. Linstedt, and E. R. Bennett.
Available from GPO, Washington, DC 20402 as EP1.23/2:73-122 - Price $2.10; microfiche from NTIS as PB-723 726 $1.45. Environmental Protection Agency, Environmental Protection Technology Series, Report EPA-R2-73-122, July 1973. 139 p, 73 fig, 8 tab, 51 ref. EPA Project 17080 DOI.

Descriptors: *Sewage treatment, *Waste water treatment, *Water reuse, Model studies, Methodology, Water conservation, Water pollution control, Water utilization, Recirculated water, Industrial water, Reclaimed water, Treatment facilities.

The efficacy of combining biological nitrification with each of two modes of chemical clarification is evaluated for production of a water suitable for specific industrial reuse applications. A 7200 gpd pilot plant was constructed, operated and analyzed. In the conventional clarification system, low doses of lime or alum were effective in removing greater than 95% of the BOD, turbidity, and suspended solids from the nitrified secondary effluent. Efficient phosphorus removals necessitated higher lime and alum additions of 300 mg/liter, and 100-150 mg/liter, respectively. At the higher lime doses, a two-fold reduction in bacterial organisms was achieved. Specific heavy metals were removed through both alum and lime additions. With either coagulant chemical, practical rapid sand filter runs of 16 hours were possible. Similar removal results were obtained with alum in a high-rate clarification flow system with direct dual-media filtration of alum flocculated wastewater. Filter runs of 5-6 hours could be realized. SEWAGE EFFLUENT AND SLUDGE MAKE POSSIBLE REVEGETATION OF STRIP MINE SPOIL BANKS,
Pennsylvania State Univ., University Park. Inst. for Research on Land and Water Resources.
W. E. Sopper, and L. T. Kardos.
Science in Agriculture, Vol 18, No 3, p 10-11, Spring 1972, 1 fig, (Pennsylvania Institute for Research on Land and Water Resources Miscellaneous Technical Report, 1971). OWRR B-020-PA (9).

Descriptors: *Sewage effluents, *Sewage disposal, *Sludge disposal, *Water reuse, Irrigation, *Strip mine wastes, Revegetation, Trees, Grasses, Legumes, Hydrogen ion concentration, Temperatures, Soil moisture, Pennsylvania, Nitrogen, Phosphorus, Toxicity, Salts.
Identifiers: Strip mine spoil banks, Toxic chemicals.

Irrigation of coal strip-mine spoil material with municipal sewage effluent and liquid digested sludge has produced dramatic results in survival and growth of tree seedlings and growth of grass and legume cover. Results indicate that these harsh sites devoid of vegetation for decades can be improved and revegetated by irrigation with wastes from municipal sewage effluent plants. Since treated sewage effluent had produced significant crop yields and tree growth, the decision was made to try the same technique on reclaiming barren waste land. Effects of the irrigation treatments on certain chemical attributes of the soil solution in the spoil were examined by sampling the percolate which passed through the 3.5 foot depth of spoil, using lysimeters installed in the

sand layer below the spoil. Potential toxicity of a spoil is best characterized by the pH. Average pH of the percolate obtained from natural rain during the months prior to the irrigation treatment ranged between 2.2 and 2.8, indicating severely toxic acidic conditions. Over the 24-week irrigation period the average pH was relatively unchanged except for the treatment using 2 inches each of effluent and sludge per week, where the pH increased significantly to 4.06. This is also the treatment which had the greatest dry matter production of grasses and legumes and the best height growth of tree seedlings. (Gelwardi-Texas)
W73-14611

REVEGETATION OF STRIP MINE SPOIL BANKS WITH SEWAGE EFFLUENT AND SLUDGE,
Pennsylvania State Univ., University Park. Inst. for Research on Land and Water Resources.
W. E. Sopper, and L. T. Kardos.
Clover Leaves, Vol 12, p 14-16, May 1971. OWRR B-020-PA (13),

Descriptors: *Sewage effluents, *Sewage disposal, *Sludge disposal, *Irrigation, Strip mine wastes, Revegetation, Trees, Grasses, Legumes, Hydrogen ion concentration, Temperature, Soil moisture, Pennsylvania, Nitrogen, Phosphorus, Toxicity, Salts.
Identifiers: Strip mine spoil banks, Toxic chemicals.

Spoil material was obtained from a bank over the Lower Kittanning bituminous coal seam in Clearfield County, Pennsylvania. This bank was selected because it has remained barren for 23 years despite repeated attempts at revegetation and is extremely acid (pH 2.0 to 3.0). Ten boxes were filled with 3 1/2 feet of spoil material in the fall of 1968, allowed to consolidate over the winter and refilled to capacity in the spring of 1969. In April 1969 each box was planted with seven species of tree seedlings--Japanese larch, white spruce, Norway spruce, white pine, European alder, hybrid poplar, and black locust. In addition, 2 species of grass (orchard grass and tall fescue) and 2 species of legumes (crown vetch and birdsfoot trefoil) were broadcast seeded in each box. Two of the boxes were untreated and maintained as controls. The remaining eight boxes were divided into four groups of two boxes for varying degrees of treatment. Treatments were very effective in establishing a ground cover of grasses and legumes. Growth response of each species was measured in terms of pounds of dry matter produced per acre and percentage of ground cover. Best germination and growth was obtained with the treatment, 2 inches of effluent and 2 inches of sludge per week, (2E+2S). Orchard grass and tall fescue had the highest dry matter yields of 3237 and 2646 pounds per acre, respectively. It was quite apparent from the results that sludge was a necessary prerequisite to the establishment of grasses and legumes from seed. The organic residue in the sludge provides the necessary additional detoxifying action to permit the germinated grasses and legumes to survive and grow. The percentage cover of the spoil material by the grasses and legumes on the irrigated treatments ranged from 28 to 100% for orchard grass, 5 to 91% for tall fescue, 3 to 56% for birdsfoot trefoil, and 2 to 58% for crown vetch. CITY OF ESCONDIDO AND VISTA IRRIGATION DISTRICT FEASIBILITY STUDY OF JOINT FILTRATION PROGRAM.
Montgomery (James M.), Inc., La Jolla, Calif.

December, 1971. 25 p, 3 fig, 2 plates, 21 tab, 1 append.

Descriptors: *Water supply, *Water treatment, *Filtration, Costs, Joint costs, Water requirements, *California.
Identifiers: Joint treatment plant, Escondido (Calif), Vista Irrigation District (Calif), Lake Henshaw (Calif).

The northern part of San Diego County has experienced a rapid increase in population during the past decade coupled with a significant trend away from agricultural use of land toward use for housing and commercial purposes. As this trend continues public demand for water of a higher quality increases. Water for both the Vista Irrigation District and the City of Escondido is obtained from the Colorado River and Lake Henshaw. Except for clorination and some addition of alum to reduce turbidity, neither of these two sources are now provided with treatment of any sort. The basic finding of this study is that it would be economically desirable for the City of Escondido and the Vista Irrigation District to construct a joint water treatment plant designed to meet initial needs through 1990, to be enlarged as future requirements dictate. Several alternative plans for the size and operation of such a plant are analyzed, particularly in terms of costs. The recommended plant size of 50 mgd would significantly reduce operation and maintenance costs as compared to two individual plants. Detailed cost data, analyses of water requirements for Escondido and the Vista Irrigation District, a discussion of the water treatment process, plus a site plan and map of the proposed plan are included. North Carolina Univ., Chapel Hill. Dept. of Environmental Sciences and Engineering.
D. G. Taylor, and J. D. Johnson.
Available from ASC-Div of Water, Air and Waste Chem., Publications Manager, Mellon Inst., 4400 Fifth Ave., Pittsburgh, Penn. 15213, Price $4.00. In: Preprints of Papers Presented at 165th National Meeting of American Chemical Society, April 8-13, 1973, Dallas, Tex: American Chemical Society, Division of Water, Air and Waste Chemistry, Vol 13, No 1, Paper 61, p 56-61, 1973. 4 fig, 11 ref.

Descriptors: *Bromine, *Bromides, *Disinfection, *Viruses, Treatment, *Water treatment, Swimming pools, *Waste water treatment.

Bromine was studied as an alternative to chlorine in the disinfection of water and wastewater. Although combined chemical species are produced when water containing organic amines or ammonia are treated with either chlorine or bromine, chloramines are ineffective as disinfectants for cysts, bacteria and viruses. Any nitrogen compounds in chlorinated waters, therefore, produce a net loss of the free chlorine species necessary for disinfection. Bromine, on the other hand, is available for the disinfection of bacteria and viruses whether it exists as free, mono or dibromamize. In addition, bromine has other characteristics which make it desirable as a disinfectant for swimming pool waters. Even high concentrations of bromine lack the problems of eye irritation and odor commonly found in chlorinated swimming pools. Bromine chloride is available as a gas at low pressure rather than as a liquid, and therefore promises to be easier to dose than liquid bromine. Moreover, since HOBr is only ionized 6% at pH 7.5 (versus 50% HOCL) only about one-half the amount is required to achieve the same concentration of active halogen at pH 7.5. (Knapp-USGS)

SIMPLE WATER TREATING APPARATUS,
Kurita Water Industries Ltd., Osaka (Japan). (assignee)
K. Watanabe.
U. S. Patent No. 3,746,174, 3 p, 4 fig, 3 ref; Official Gazette of the United States Patent Office, Vol 912, No 3, p 945, July 17, 1973.

Descriptors: *Patents, *Water treatment, Equipment, Chlorine, *Activated carbon, Organic compounds, Water quality control, Waste water treatment, Potable water.
Identifiers: *Chemical conditioners, *Chemical treatment, Ferric compounds.

In the apparatus water is conditioned chemically by conditioning materials enclosed in a magazine. Conditioning materials such as active carbon which adsorbs organic and ferric components in the water, and calcium sulfite pellets which eliminate residual chlorine are enclosed in the magazine of the treatment unit. Only the water treated inside the magazine is discharged at the outlet. This is accomplished by using the water pressure at the tap to prevent the flow of untreated water by-passing the magazine. The higher the water pressure the greater this effect. The magazine consists of cylindrical body walls, a magazine cap and a magazine bottom. The cap and bottom each have water passages in the form of holes or slots. A screen of small mesh is applied on the inner surface of the magazine cap and bottom to prevent the enclosed water conditioning material from being carried out through the water passage. A POTABLE WATER DISPENSER, (PATENT APPLICATION, NASA CASE MFS-21115-1),
National Aeronautics and Space Administration, Huntsville, Ala. George C. Marshall Space Flight Center. (Assignee).
H. R. Cunningham.
Available from the National Technical Information Service as N72-28097. U.S. Patent Application Serial No. 266,930, June 28, 1972. 20 p, 7 fig.

Descriptors: *Patents, *Potable water, Equipment, Water utilization, Water measurement, *Jets.
Identifiers: *Water dispensers.

A dispenser supplies precisely measured charges of potable water into food or beverage reconstitution bags used aboard spacecraft. It has a water dispensing jet at one end and a measuring stop at its opposite end. The dispenser includes a tubular body having an axially 'reciprocable' piston within it. The piston is spring-biased toward an end wall forming a closure and having a chamber intake port and a chamber ejection port. The volume of the chamber is dictated by the position assumed by the head of the piston. The extent to which the piston is displaced for expanding the chamber is dictated by the position assumed by the measuring stop. Delivery of potable water to and from the chamber is controlled by a rotary valve while final dispensing of water is controlled by a juxtaposed linear valve. (Sinha-OEIS)
W73-14734

A FLUID DISPENSER, (PATENT APPLICATION, NASA-CASE-MFS-21163-1),
National Aeronautics and Space Administration, Huntsville, Ala. George C. Marshall Space Flight Center. (Assignee).
T. A. Cook, and H. Scheibe.
Available from the National Technical Information Service as N72-28098. U.S. Patent Application Serial No 266,925, June 28, 1972. 18 p, 8 fig.

Descriptors: *Patents, Water supply, Equipment, Water utilization, *Potable water, Water measurement, *Jets.
Identifiers: *Water dispensers.

A fluid dispenser is described for use in dispensing precisely measured quantities of potable water aboard operative spacecraft. It is confined within a housing designed to be held in a crewman's hand and is coupled with a source of potable water under pressure. The dispenser is provided with a jet which has a mouthpiece for use of the crewman. An innovation is that it has a manually operable rack and pinion drive coupling for initiating a dispensing cycle so that an accurate record of water consumed can be maintained. Mounted on the housing is the trigger unit having a thumb-actuated lever which is digitized for initiating the operation of the dispenser. The housing contains a network of fluid conducting passageways including an inlet passageway which terminates at an intake port. There is a dispensing passageway which terminates at the mouth piece of the jet. The measuring chamber is, in practice, a bore having a cylindrical configuration terminating in a base wall. The dimensions of the measuring chamber at any given instant are determined by the position then assumed by a plug relative to the longitudinal axis of the chamber. The chamber is permitted to discharge only after it has been completely filled and the thumb-actuated lever is released. This permits the crewman to properly position his lips over the mouthpiece before releasing the lever so no water will be spilled. (Sinha-OEIS)

LANCASTER COUNTY, PENNSYLVANIA, COMPREHENSIVE SEWERAGE PLAN.
Huth Engineers, Inc., Lancaster, Pa.

Prepared for Lancaster County Planning Commission, October, 1970. 103 p, 8 fig, 26 tab, 9 append.

Descriptors: *Sewerage, *Comprehensive planning, *Pennsylvania, Regional development, Planning, Coordination, Sewage treatment, Sewage disposal, Financing, Land use, Treatment facilities.
Identifiers: *Lancaster County (Pa.), Pennsylvania Sewage Facilities Act, Sewage Facilities Committee.

Using horizon years of 1980, 1990, and 2010, this study calls for eventual formation of six regional sewerage systems and six municipal systems to serve 85% of the county's population by 2010. The remainder of the county would be served by 'package' treatment plants and on-site disposal systems. Multiple sewerage systems are to be based on drainage basins because population density will be insufficient to warrant a unitary sewerage system. Lancaster County commissioned the study in response to the Pennsylvania Sewage Facilities Act (Act 537). Considerations in the sewerage system planning process included population projections, local economic conditions, existing public facilities, natural resources (especially soil types), agricultural land-use patterns, topography, methods of administering, financing and operating regional sewerage systems, and currently proposed sewerage plans. The study recommends a regional approach to sewage collection and treatment with establishment of a Sewerage Facilities Committee to coordinate specific projects. The basis for this recommendation is a brief exposition of alternative administrative and financial techniques for sewerage systems. Extensive technical data including 13 plates are in the appendices. (Stein-North Carolina)
W73-14234

REPORT ON MAKEUP WATER FOR THE UPPER CANYON LAKES, LUBBOCK, TEXAS.
Freese, Nichols and Endress, Fort Worth, Tex.

September, 1971. 38 p, 7 fig, 9 tab, 3 append.

Descriptors: *Water quality, *Water quality control, *Reclaimed water, Water treatment, Groundwater, Irrigation, Effluents, Evaluation, *Texas
Identifiers: *Spray irrigation, *Lubbock (Tex).

Lubbock proposes a chain of small lakes for recreational non-swimming use in a dry canyon running through the city. The study identifies three alternative sources of makeup water, each of which would have to be pumped upstream approximately eight miles into the uppermost lake. Alternative sources are (1) groundwater from beneath farmlands now being irrigated with treated effluent from the city's Southeast Reclamation Plant, (2) effluent from the new activated sludge unit at the Southeast Plant without intermediate use of the water for irrigation, and (3) water reclaimed by an operational-scale plant similar to a present pilot plant of Ecological Research Associates. Quantitative standards for water quality which would protect environmental health and aesthetics were set. Quality of water from the three sources was compared with the desired standards. Groundwater from beneath the irrigated farm needed only to be aerated to replenish dissolved oxygen, while other sources would require significant additional treatment in order to meet the standards. Costs of treating water from each source to raise water quality to the desired standards were calculated. It was concluded that the groundwater source would be superior to alternatives in terms of both water quality and economy. (Stein-North Carolina)
W73-14236

WATER QUALITY MANGEMENT PLAN FOR ALAMEDA CREEK WATERSHED ABOVE NILES.
Brown and Caldwell, San Francisco, Calif.

September, 1972. 205 p, 66 fig, 58 tab, photos, 2 append.

Descriptors: *Planning, *Water quality, Financing, Water demand, Water supply, Wastewater disposal, Environmental effects, California.
Identifiers: *Government standards, Alameda County (Calif.), Livermore (Calif.), Pleasanton (Calif.).

A comprehensive water supply and waste water treatment and disposal plan via a total water quality management approach is discussed. The study divides into three major sections: First, existing environmental characteristics and water supply and wastewater programs are reviewed. Second, water quality problems and objectives are identified. The methodology for cost estimates and economic analyses is explicated. Third, the conceptual development and engineering and economic evaluation of alternative plans is described, together with an evaluation of the effects of each on downstream areas and benefits of improvements to the Alameda Creek watershed area, located southeast of San Francisco, California. The final recommended plan is described in terms of physical facilities, costs, staging and governmental structures and institutional frameworks required for implementation. Specifically, a staged wastewater reclamation plan emphasizing land disposal and implemented by a single Valley-wide agency is recommended. (Hoffman-North Carolina)
W73-14237

AREAWIDE COMPREHENSIVE WATER-SEWER PLAN, PART 2, PHASE I, 1970-1995, BREVARD COUNTY, FLORIDA.
Brevard Engineering Co., Cape Canaveral, Fla.

Prepared for Brevard County Board of County Commissioners, and Brevard County Planning Department, September, 1972. 104 p, 20 fig, 25 tab.

Descriptors: *Planning, *Water supply, *Sewerage, *Coordination, Storm drains, Urban areas, Land use, Costs, Water quality standards, Projections, *Florida.
Identifiers: *Cape Kennedy Space Center, Brevard County (Fla).

The rapid rate of growth and existing levels of urban development in Brevard County, largely because of the Cape Kennedy Space Center, make it necessary for county coordination and planning in the extension of water sewerage, and drainage facilities. The county is presently serving as a liaison between local governmental units. Discussed are factors affecting utility extension such as population trends, urban land use patterns, urban development policies, and pollution standards; alternative plans and systems; recommended treatment processes and utility systems; implementation, including a short range program; and preliminary cost estimates for the main system components. Basic recommendations include the interconnection of the three main local water supply systems and the disposal (and eventual reuse) of effluents west of the coastal ridge to conserve water supplies. (Elfers-North Carolina)
W73-14241

URBAN SYSTEMS ENGINEERING DEMONSTRATION PROGRAM. VOLUME V. CAPITAL IMPROVEMENTS PROGRAM,
Diversified Consultants, Inc., Jackson, Miss.
J. A. Elliott, R. L. Waters, and A. P. Desmarais.
Available from the National Technical Information Service as PB-213 096; $5.75 in paper copy, $1.45 in microfiche. Prepared for the Gulf Regional Planning Commission, Gulfport, Mississippi, 1972. 67 p, 1 fig, 2 tab, 62 ref. MS-USE-1.

Descriptors: *Planning, *Water supply, *Sewerage, *Storm drains, *Mississippi Gulf Coast, Coasts, Implementation, Financing, Priorities, Costs.
Identifiers: *Capital improvements, *Mississippi Gulf Region, Utilities extension, Council of Governments.

Key objective of this engineering-oriented program for the planning and development of water supply, sanitary sewerage, storm drainage, and solid waste disposal systems for a four county region in Mississippi is to provide capital improvements which will encourage and support new growth and development. Focus is on implementation of areawide urban systems problems. Three basic alternative approaches appear practical: (1) establishment of metropolitan regions to deal with massive urban systems problems, (2) massive financial incentives, and (3) direct federal assumption of metropolitan responsibilities. The regional authority should be responsive to local interests and needs with specific functions well defined in its statutes. General implementation procedures such as public hearings, adaptation of plans, review of independent planning activities and establishment of priorities, and creation of a central billing office for handling water and disposal of solid waste charges are discussed. Specific projects are described including timing of their implementation, and cost estimates. (Elfers-North Carolina)

RESEARCH AND DEVELOPMENT IN INDUSTRIAL CORPORATIONS: CAN ADVANCED SOCIETIES LEARN TO CONTAIN POLLUTION,
Minnesota Univ., Minneapolis. Dept. of Sociology.
R. E. Rickson.
Available from the National Technical Information Service as PB-223 504, $3.00 in paper copy, $1.45 in microfiche. Minnesota Water Resources Research Center, St. Paul, Bulletin 62, August 1973. 23 p, 34 ref. OWRR B-047-MINN (1). 14-31-0001-3294.

Descriptors: *Decision making, Pollution, Control, *Minnesota, Organization, Environmental effects, Industries, *Research and development, Social change.
Identifiers: *Policy decisions.

The development and distribution of knowledge has long been of interest to policy-makers and social scientists. Because of the power of industrial corporations and the influence they have over the general research and development process, societies have the knowledge to deal with problems that coincide with corporate goals but have difficulty handling problems where solutions are, in the short run, contradictory to the uninterrupted pursuit of economic goals. A good example is societal ability to deal with waste or pollution. Two processes are important: (1) the process by which resources are allocated to research at the corporate and societal level and (2) the management of the expert role by organizations. ULTIMATE MANAGEMENT OF RADIOACTIVE LIQUID WASTES,
Idaho Nuclear Corp., Idaho Falls.
C. M. Slansky, and J. H. Buckham.
Chemical Engineering Progress Symposium Series No. 97, Vol 65, 1969, p 26-31, 6 fig, 2 tab, 17 ref.

Descriptors: *Radioactive waste disposal, *Nucelar power plants, *Electric power production, Public health, Food chains, Liquid wastes, Separation techniques, Transportation, Storage, Ultimate disposal, Radioisotopes, Water quality control, *Waste disposal.
Identifiers: *Transmutation, Half-life.

An estimated 7950 metric tons of fission products will result from nuclear electric power generation in the year 2000, if current trends continue. Development of nuclear processes is such that an economical method of ultimate disposal of such wastes has not been developed, although if such a method had been developed it would undoubtedly be obsolete in 30 years anyway. Therefore, the problem to be faced now is interim storage of waste products so that the short-lived radioisotopes can decay and the long-lived radioisotopes can be retrived for ultimate processing. The processes, both storage and ultimate processing, should also be within the means of smaller developing nations which desperately need the nuclear power. Methods of ultimate disposal currently being investigated include transmutation to stable isotopes in a nuclear reactor, and transportation by rocket to the sun or other suitable locations. Ultimate storage in ocean trenches and deeps has been proposed and is being investigated. Current practices of interim storage include mainly underground storage of liquid or solid containerized wastes. Further extensive testing is needed for all phases of both disposal, ultimate storage and interim storage to protect the environment from serious damage. (Lowry-Texas)

MODELS FOR MANAGING REGIONAL WATER QUALITY,
Harvard Univ., Cambridge, Mass. Harvard Water Program.

Harvard University Press, Cambridge, Mass., 1972. R. Dorfman, H. D. Jacoby, and H. A. Thomas, Jr., Editors. 453 p.

Descriptors: *Mathematical models, *Water quality control, *Municipal water, River basins, Estuaries, *Mangement, *Decision making, *Optimization, Political aspects, *Regional analysis, Analytical techniques, Stochastic processes, Multiple-

purpose reservoirs, Economics, Technology, Waste water treatment, Tertiary treatment, Systems analysis.
Identifiers: Biochemical pollution, Human wastes, Artificial aeration, Public agencies, Delaware Estuary.

Nine essays are presented on various aspects of water quality control in a basin or estuary. They are unified by the conviction that the social and technological aspects of the problem are inseparable. The emphasis throughout is on the development of analytical models that can encompass both the social and technological facets and explore the practicability of integrating the physical, economic, and institutional aspects of regional water management. Primarily, models suited to biochemical pollution, rivers and extuaries, and municipalities are discussed. Included are: (1) The pollution problem in a historical setting; (2) a linear programming model of political decision making applicable to water resource problems and applied to a hypothetical basin; (3) a model of municipal behavior under the uncertainty of supply; (4) uncertainty as it affects design and operating decisions made by public agencies; (5) dynamic programming to evaluate the use of artificial aeration to control dissolved oxygen in estuaries; (6) wastewater conveyance and regional treatment facilities; and (7) flow regulation for quality control, emphasizing political admissibility, and utilizing linear programming. WASTE DISPOSAL IN NATURAL WATERWAYS,
Harvard Univ., Cambridge, Mass. Dept. of Sanitary Engineering.
H. A. Thomas, Jr.
In: Models for Managing Regional Water Quality (ed. by R. Dorfman, H. D. Jacoby, and H. A. Thomas, Jr.), Harvard University Press, Cambridge, Massachusetts, p 1-41 (Chapter 1), 1972. 4 fig, 10 tab, 31 ref.

Descriptors: *Water pollution control, *Natural streams, *Waste disposal, *Mathematical models, Water quality, Analytical techniques, Sanitary engineering, Industrial wastes, History, Ecology, Management, *Regional analysis, Massachusetts, Equations, Hydrologic data, Biomass, Lakes, Estuaries, Reaeration, Biochemical oxygen demand, Systems analysis, Economics.
Identifiers: *Biochemical pollution, Human wastes, Dilution, Natural purification, Pollution load, Synecology, Streeter-Phelps formulation.

This essay provides a broad perspective of the pollution problem in an historical setting. Methods of analysis of stream pollution problems are described with three objectives: (1) To discuss the ecological principles on which the methods are based; (2) to comment on the reliability of predictions relating pollution load to water quality, and to indicate gaps in present knowledge; and (3) to examine limitations of the water-carriage system of waste disposal with further economic growth. Developments are presented in historical sequence, with advanced theories interpolated to provide perspective relating to strengths and limitation of current sanitary engineering practice based largely on investigations of the U.S. Public Health Service during the early 20th Century. Subsequent improvements of the classical theory are then outlined, and recent research trends in areas where present methods are unsatisfactory are indicated. Special attention is given to biochemical pollution from human and industrial wastes and to the empirical basis of the mathematical models commonly used to describe this phenomenon. As an introduction to the mathematical analysis of water pollution, a water pollution crisis that arose in Massachusetts at the the turn of the century is examined. W73-14458

CONCEPTUAL MODEL OF A REGIONAL WATER QUALITY AUTHORITY,
Harvard Univ., Cambridge, Mass.
R. Dorfman.
In: Models for Managing Regional Water Quality (ed. by R. Dorfman, H. D. Jacoby, and H. A. Thomas, Jr.), Harvard University Press, Cambridge, Massachusetts, p 42-83 (Chapter 2), 1972. 4 fig, 16 ref.

Descriptors: *River basin commissions, *Water quality, *Management, *Mathematical models, *Political aspects, Engineering, *Pollution abatement, Social aspects, Economics, Technology, Decision making, Data collections, Data processing, Evaluation, Systems analysis, Cost-benefit analysis, Benefits, *Regional analysis.
Identifiers: Constrained maximization, Prediction.

Water quality management decisions are reconciliations of diverging opinions and conflicting interests. This fact is almost universally ignored, however, in most discussions of water resource design and project evaluation. Consequently, there are no known methods of design which account for political considerations. The first of a pair of essays that endeavors to integrate social and economic considerations with the technical and engineering aspects of water quality management, this article proposes a model of political decision making applicable to water resource problems, and advocates its application to the analysis of pollution control institutions and projects. The model collects and organizes pertinent data, and predicts that certain initially conceivable decisions will not, in fact, be adopted. Described at some length is the milieu in which river basin authorities operate and the considerations that impinge upon their decisions. Discussed is how these considerations could be formalized and quantified; it is seen that the authority's decision problem can be expressed as a family of formal mathematical problems involving constrained maximization. It is deduced that benefit-cost analysis presupposes the agency 'knows best' what the objectives of society are with respect to matters within its jurisdiction, and can arrive at decisions without consulting the citizens concerned. (See also W73-14457 and W73-14460) (Bell-Cornell)
W73-14459

AN ILLUSTRATIVE MODEL OF RIVER BASIN POLLUTION CONTROL,
Harvard Univ., Cambridge, Mass.
R. Dorfman, and H. D. Jacoby.
In: Models for Managing Regional Water Quality (ed. by R. Dorfman, H. D. Jacoby, and H. A. Thomas, Jr.), Harvard University Press, Cambridge, Mass., p 84-141 (Chapter 3), 1972. 6 fig, 11 tab, 5 ref, 1 append.

Descriptors: *River basin commissions, *Water pollution control, *Management, *Political aspects, *Mathematical models, Standards, *Water quality standards, Decision making, Costs, Municipal wastes, Industrial wastes, *Regional analysis, Technology, Planning, Systems analysis.

That water quality management decisions are reconciliations of diverging opinions and conflicting interests is almost universally ignored in most discussions of water resource design and project evaluation. Consequently, there are no known methods of design which account for political considerations. The second of a pair of essays that endeavors to integrate social and economic considerations with the technical and engineering aspects of water quality management, this article tests a conceptual model of political decision making applicable to water resource problems by applying it to a hypothetical river basin. Several municipal and industrial dischargers contribute to the generally poor quality of the sample river; most of these same agents, along with others, both inside and outside the basin, have an interest in bringing the river to a higher quality standard. The questions are how high a standard to strive for and who should bear the cost of achieving it. The model collects and organizes pertinent data, and predicts that certain initially conceivable decisions will not, in fact, be adopted. The model focuses on a pollution control commission charged with formulating and implementing a plan for the basin and on the way economic and technical factors combine with political considerations to influence commission decisions. MUNICIPAL EVALUATION OF REGIONAL WATER QUALITY MANAGEMENT PROPOSALS,
Resources for the Future, Inc., Washington, D.C.
C. S. Russell
In: Models for Managing Regional Water Quality (ed. by R. Dorfman, H. D. Jacoby, and H. A. Thomas, Jr.), Harvard University Press, Cambridge, Mass., p 142-203 (Chapter 4), 1972. 9 fig, 12 tab, 46 ref, 1 append.

Descriptors: *Water quality control, *Benefits, Estimating, *Evaluation, *Mathematical models, *River basin commissions, *Decision making, Alternative planning, Political aspects, Human population, Water supply, Water treatment, Costs, Aesthetics, Recreation facilities, Cost-benefit theory, Financing, Cost sharing, Municipal water, Chemicals, Biochemical oxygen demand, Equations, Systems analysis, *Regional analysis.
Identifiers: Improvements, Interest groups, Nashua (N.H.), Dissolved minerals, Group benefits.

Presented is an approach to the problem of municipal evaluation of the benefits from local water quality improvements. The attitudes of municipal authorities are important influences on commission decision making. As a result, the analysis of basin-wide quality decisions requires an estimate of the value of alternative plans, as viewed from the standpoints of participating cities. Municipal authorities' acceptance or rejection of a regional scheme depends on their balancing of tis consequences for their various constituents, who enjoy city benefits but also must pay taxes. A model of municipal behavior in these circumstances is formulated and tested. The model and its implementation are discussed in two parts: (I) The identification of interest groups and the estimation of group benefits from various levels of quality improvement and of the group cost shares under alternative financing plans; and (II) the combination of these estimates within the framework of a political constraint and a set of relative group political weights (municipal willingness to pay for aesthetic improvement and increased recreational opportunities). An application of the model to Nashua, New Hampshire is presented. An appendix: 'Mineralization Damages to Water System Customers--Their Conceptual Role and Some Empirical Results' is included. OPTIMUM GOVERNMENT INVESTMENT IN SUPPLY SYSTEMS YIELDING UNCERTAIN OUTPUTS,
S. J. Turnovsky.
In: Models for Managing Regional Water Quality (ed. by R. Dorfman, H.D. Jacoby, and H.A. Thomas, Jr.), Harvard University Press, Cambridge, Mass., p 233-264 (Chapter 6), 1972. 2 fig, 14 ref.

Descriptors: *Governments, *Investment, *Management, Economics, *Design, *Optimization, *Stochastic processes, Estimating, Benefits, Marginal costs, Marginal benefits, Decision making, Equations, Mathematical models, Systems analysis, *Risks.
Identifiers: *Supply systems, Nonlinear programming, Consumers.

In water resources project development, one must account for inevitable uncertainties in system performance due to variation in the myriad system inputs and parameters. This is the second of a pair of articles which considers the special problem of uncertainty as it affects the design and operating decisions made by public agencies. This article considers the optimal planning of public investment and management schemes when there is a stochastic component in the pattern of goods they provide. Particular attention is paid to the estimation of benefit functions in this situation, and to the design of supply systems when output variance is subject to control. With the aid of a model based on consumer decision making where supplies are stochastically determined, a procedure for estimating the expected benefits from consuming such commodities is derived. The results are then used to determine the optimal price and design for a stochastic supply system; the optimization is performed in two steps: (1) determination of how to select specifications that will enable a supply system of a given quality to be achieved most economically; and (2) assuming an efficient design, the socially optimal price and the standard deviation, mean, and reliability of the supply are established. (See also W73-14457 and W73-14462) (Bell-Cornell)
W73-14463

ARTIFICIAL AERATION AS A SUBSTITUTE FOR WASTEWATER TREATMENT,
L. Ortolano.
In: Models for Managing Regional Water Quality (ed. by R. Dorfman, H.D. Jacoby, and H.A. Thomas, Jr.), Harvard University Press, Cambridge, Mass., p 265-311 (Chapter 7), 1972. 4 fig, 4 tab, 34 ref.

Descriptors: *Water pollution control, *Tertiary treatment, *Aeration, *Dissolved oxygen, *Optimization, Model studies, Costs, *Numerical analysis, Management, Water quality, Standards, Dynamic programming, Alternative planning, Esturaries, Streams, Economies of scale, Equations, Systems analysis, Waste water treatment.
Identifiers: *Delaware Esturary, Computer algorithms, Cost functions, Sensitivity analysis.

Artificial aeration is the deliberate introduction of oxygen into a watercourse to enhance self-purification. Mathematical models are used to examine the role of artificial aeration as a substitute for tertiary treatment in the control of the dissolved oxygen levels of streams and estuaries. The models determine the location and sequencing of artificial aerators and tertiary treatment plants to meet the specified water quality standards at minimum cost. The models presented increase in complexity from a simple case involving only a single aerator location and no tertiary treatment, to a very general case involving an arbitrary number of aeration locations and waste sources. The simpler models are appropriate for individual municipalities or industries, while the more general models can be used for regional planning. Most of the cases discussed are illustrated by numerical examples based on data from the Delaware Estuary, somewhat simplified for ease of computation. The models consistently yieldsolutions favoring artificial aeration over tertiary treatment. Various sensitivity analyses indicate that aearation figures prominently in model solution even when aeration cost parameters are increased significantly. (See also W73-14457) (Bell-Cornell)
W73-14464

WASTEWATER CONVEYANCE MODELS,
T. Chi.
In: Models for Managing Regional Water Quality (ed. by R. Dorfman, H.D. Jacoby, and H.A. Thomas, Jr.), Harvard University Press, Cambridge, Mass., p 312-361 (Chapter 8), 1972. 4 fig, 11 tab, 12 ref.

Descriptors: *Water quality control, *Waste water treatment, *Conveyance structures, *Pipes, *Treatment facilities, *Regions, Design, Management, Optimization, Economics, Technology, Costs, Size, Flow rates, Hydraulic gradient, Economies of scale, Scheduling, Investment, Methodology, Estuaries, Equations, Systems analysis.
Identifiers: Delaware Estuary, Cost functions.

Technological and cost functions pertaining to waste water treatment and conveyance are developed in a form appropriate for incorporation in a comprehensive model for regional management of water quality. The transporting of wastes to some combination of regional treatment plants, or piping them out to sea, is considered as an alternative to on-site waste removal. The model identifies efficient spatial and temporal patterns of wastewater treatment, conveyance, and ultimate disposal to receiving water at a stage in the over-all project design in which the principal waste sources have been determined, and decisions have been made regarding water quality in the streams. It accommodates several waste sources, treatment plants, and alternative discharge points; solutions give schedules of construction of control works and operation of the various components over a period of 20-30 years. The objective function includes cost of construction and operation of the various components discounted to the present. Used is a sample problem concerned with multiperiod planning of estuarine quality control and utilizing data from the Delaware Estuary. A modified form of Roger's technique of random sampling has been used in an application of the model to the polluted estuary. (See also W73-14457) (Bell-Cornell)
W73-14465

FLOW REGULATION FOR WATER QUALITY MANAGEMENT,
Cornell Univ., Ithaca, N.Y. Dept. of Environmental Engineering.
D. P. Loucks, and H. D. Jacoby.
In: Models for Managing Regional Water Quality (ed. by R. Dorfman, H.D. Jacoby, and H.A. Thomas, Jr.), Harvard University Press, Cambridge, Mass., p 362-431 (Chapter 9), 1972. 11 fig, 8 tab, 11 ref. OWR Projects C-1034 (No. 1575) (2) and C-1640 (No. 3151) (6).

Descriptors: *Political aspects, *Flow control, *Water quality control, *Linear programming, *Multiple-purpose reservoirs, *Management, Reservoir storage, Analytical techniques, Model studies, Evaluation, Streams, Waste treatment, River basins, Stochastic processes, Digital computers, Simulation analysis.

Flow regulation is considered as a means of quality control. A set of deterministic and stochastic linear programming models is developed to screen alternative multipurpose flow regulation schemes--and the associated waste treatment plans--in search of those few that warrant detailed analysis by digital simulation. A mathematical model of carbonaceous and nitrogenous biochemical pollution and a model of political decision making are combined to screen flow regulation and wastewater treatment alternatives according to the likelihood of their political admissibility, as well as their economic and technical feasibility. The models are applied to a hypothetical Bow River Valley planning problem developed in previous chapters of the book. (See also W73-14457) (Bell-Cornell)
W73-14466

CONCEPTS FOR EFFECTIVE MANAGEMENT OF WATER QUALITY IN CONNECTICUT,
Connecticut Dept. of Environmental Protection, Hartford.
R. B. Anderson.
University of Connecticut, Storrs, Institute of Water Resources Report No. 18, April 1973, 54 p, 16 fig, 41 ref.

Descriptors: *Water quality, *Water management (Policy), *Water pollution control, Economics, *Connecticut, Evaluation, Institutional constraints, Management.

The basic elements necessary for an effective water quality management program are presented with concept limitations. Economic factors are illustrated by comparing water quality management to a free market condition. Engineering considerations are discussed including mathematical water quality predictive models and other technical considerations. The behavior of local governments is analyzed as it relates to regional water quality management aspects. A conceptual approach with a real world example is presented for analyzing water quality management and waste treatment management problems. The example consists of a waste discharger and a downstream water user with minimum water quality requirements. Attempts to define least cost and cost effective pollution abatement strategies as well as to perform cost analyses of specified water quality standards are described.

REPORT ON HALF MOON LAKE.
Half Moon Lake Restoration Committee, Eau Claire, Wis.

March 1973. 106 p, 5 fig, 12 tab, photos, 8 ref, append.

Descriptors: Water quality, *Water quality control, *Recreation, *Environmental effects, Water pollution, Nutrients, Financing, Shoreline cover, Fishing lakes, Effluents, *Wisconsin.

Identifiers: *Shoreline maintenance, Eau Claire (Wisc), Shoreline development, *Half Moon Lake (Wisc).

The Half Moon Lake Restoration Committee was created by the City of Eau Claire in 1971 to study the deteriorating quality of the lake and to determine ways to improve it. Lying entirely within the city limits, the lake, relatively shallow with a maximum depth of 9 feet, is a 132 acre ox bow cutoff of the Chippewa River. Renewal water comes from small springs, storm sewers, rain and snowfall. The Committee focused on questions of the history and quality of urban development on the five mile shoreline of the lake, sources of water and flow of water, water quality in the lake, recreational opportunities offered by the lake and adjacent park complex, and means of financing proposed improvements. The Committee views the Carson Park-Half Moon Lake complex as an extremely important recreation asset in the county and thus recommends a three-phase plan for improvement. Phase I consists of actions that can be undertaken immediately and will offer significant benefits. These actions include a shoreline maintenance program, a citizen clean-up campaign, land acquisition, wherein as much private ownership as possible should come under public ownership or public control. Scenic easements should be secured where purchase by the city is impossible. Phase II includes projects that require considerable study and investment including facilities to improve the water quality of the lake by using a well capable of delivery 2.5 mgd as a supplemental source to reduce nutrient content by flushing effect; provision of an iron removal process; removal of silt and oils from storm sewers by creation of sedimentation facilities. Phase III would include long term projects such as the construction of a dam to control silt entering the lake and the diversion of storm water runoff. (Elfers-North Carolina)

WATER AND LIQUID WASTE MANAGEMENT: POLICIES, SYSTEMS PLANS, PROGRAM.
Tulare County Planning Dept., Visalia, Calif.

Prepared for Tulare County Association of Governments, December 1971. 354 p, 26 fig, 6 tab, 46 plates, 6 append.

Descriptors: *Planning, *Water supply, *Sewerage, Environmental effects, Urbanization, Land use, Water demand, Projections, Financing, Coordination, Rural areas, *California.
Identifiers: *Urban growth policies, *Utility extension policies, *Tulare County (Calif), Kaweah River basin (Calif), Three Rivers (Calif).

The purpose is not only to plan for future county-wide water supply and wastewater disposal systems, but also to help formulate a county-wide growth strategy and face several crucial issues related to land use planning and environmental quality. This report is closely related to other elements of the County's General Plan and to the pilot study to develop a prototype Environmental Resources Management Element of a General Plan. Scope is limited to rural areas of the county, unincorporated communities and cities with a population of less than 5,500. These communities were classified as: Farm Labor Residential Community; Minor Rural Service Center; Major Rural Service Center; Municipality; Unincorporated Residential Tract; and Recreation Oriented and Retirement Community. Sections on the specific planning subareas and projections, evaluation of existing water supply and wastewater systems, future water demands and wastewater loads, water quality objectives, recommended management plans, and plan implementation, especially financing are presented. Some of the recommendations include the provision of water and sewer services only to communities with a favorable growth prognosis, the development of additional groundwater recharge facilities, the discouragement of scattered and fragmented systems, the extension of existing systems to promote orderly urban growth, the prohibiting of system extensions in airport zones, flood plains, aquifer recharge areas, and potential recreation areas, and the discouragement of the use of septic tanks. (See also W73-14498) (Elfers-North Carolina)

WATER AND LIQUID WASTE MANAGEMENT: POLICIES, SYSTEMS PLANS, PROGRAM--PART II.
Tulare County Planning Dept., Visalia, Calif.

Prepared for Tulare County Association of Governments, June 1972. 163 p, 31 fig, 26 tab, 2 append.

Descriptors: *Planning, *Water supply, *Sewerage, Environmental effects, Urbanization, Land use, Water demand, Projections, Financing, Groundwater recharge, *California.
Identifiers: *Urban growth policies, *Utility extension policies, *Tulare County (Calif), Central Valley Project (Calif), Dinuba (Calif), Tulare (Calif), Visalia (Calif).

This report is the second part of a very comprehensive effort to plan for future water supply and wastewater disposal systems for Tulare County, particularly in relation to issues of environmental quality and land use planning. It contains an overview of the growth pattern of three cities, Dinuba, Tulare and Visalia, whose urbanized acreage for each community is expected to double by 1990, and their key water supply and pollution problems. These cities are situated on the valley floor overlying an extensive underground reservoir which provides a potable water supply for domestic and municipal services. Planning factors such as socio-economic development, population, and land use are examined. An evaluation of existing water supply and wastewater systems, recommendations for expansion of these systems, and a discussion of financing and implementing these improvements are included. Some of the recommendations include the full support of the Central Valley Project which would convey water from the Sacramento area, the development of additional groundwater recharge facilities, the extension of central water and sewerage systems to promote orderly growth, the discouragement of septic tanks via zoning and subdivision regulations, the exclusion of sewer trunk lines from areas planned for agricultural and open space uses, and the adoption of ordinances requiring pretreatment of certain wastes at their source. POLLUTION IN A NEO-CLASSICAL WORLD.--THE CLASSICS REHABILITATED.
S K Kuipers, and A Nentjes
The Economist, Vol 121, No 1, p 52-67, 1973. 3 fig, 4 ref.

Descriptors: *Theoretical analysis, *Pollution abatement, *Gross National Product, *Limiting factors, Economic efficiency, Mathematical models, Agriculture, Industries, Environment, Productivity, Employment.
Identifiers: *Pollution control costs, *Economic growth.

Increasing returns to industry and output growth resulting from technical progress, capital accumulation and working population growth is the basis of the neo-classical growth theory. The effect of the rising cost of economic growth now incurred by the recognized necessity of pollution abatement in this theory is investigated and a rehabilitation of the classical theory of growth is recommended. This would involve recognition of the environment as a scarce resource and, thus, the increasing costs of pollution could, under certain assumptions, place a limit on the growth output. A simplified model which associates pollution costs with capital stock and quantity of environment in a specific country and includes the possible effects of several forms of technical progress is employed. The analysis indicates that the neo-classical 'golden age' of continuous full employment is only a special case in which land-augmenting technology exceeds the growth rate of labor in efficiency units and the propensity to save is sufficently high. Under alternative parametric values the model generates a classical progressive state or a classical semi-stationary state. This analysis is compared to the Club of Rome's publication 'The Limits to Growth.' (Weaver-Wisconsin)

THE EFFECTS OF POLLUTION CONTROL ON THE NONFERROUS METALS INDUSTRIES: LEAD. PART I. INTRODUCTION AND EXECUTIVE SUMMARY.
Charles River Associates, Inc., Cambridge, Mass.

Available from the National Technical Information Service as PB-207 155, $3.75 in paper copy, $1.45 in microfiche. Report prepared for Council on Environmental Quality, December 1971. 21 p, 3 tab.

Descriptors: *Pollution abatement, *Economic impact, Air pollution, *Water pollution control, Costs, Zinc, Lead, Industries, Regulation.
Identifiers: *Lead industry, Sulfur dioxide, Market analysis, Industry organization.

A broad profile of the lead industry is presented including its market environment, technology, and internal structure. The probable economic effect and costs to meet the Environmental Protection Agency standards of sulfur dioxide emissions from smelters into the air and waste discharges into water are evaluated, giving estimates of long-run costs for attaining 90% feed sulfur removal. Although long-run consumption trends (growth at 1% per year) are not expected to be altered due to the relative price inelasticity of demand for lead and the small price increases required to finance pollution control costs, a loss of 40% of the tetraethyl market is expected by 1975 due to increased use of lead-free gasoline. Replacement of older mines and smelters and increased market concentration are expected supply trends, which will be accelerated as pollution control costs real-

locate supply from high- to low-cost producers due to the disproportionate incidence of these costs to high-cost producers. (See also W73-14517) (Weaver-Wisconsin)
W73-14516

THE EFFECTS OF POLLUTION CONTROL ON THE NONFERROUS METALS INDUSTRIES: LEAD. PART II. STRUCTURE OF THE INDUSTRY.
Charles River Associates, Inc., Cambridge, Mass.

Available from the National Technical Information Service as PB-207 156, $4.85 in paper copy, $1.45 in microfiche. Report prepared for Council on Environmental Quality, December 1971. 92 p, 2 fig, 4 tab.

Descriptors: *Industries, *Lead, Industrial production, Marketing, Prices, Mining, Regulation, Economic impact, Pollution abatement, *Missouri, Water pollution control.
Identifiers: *Industry structure.

General and specific characteristics of the lead industry and its market environment (including demand and supply conditions, the state of technology, the structure of the industry, price trends and industry-relevant governmental policies) are reviewed in order to provide a basis for the economic evaluation of pollution controls on the lead industry. Supply trends indicate that the U.S. is gaining an increasing share of world production due to low-cost technologies applicable to new deposits discovered in Missouri. Although mining costs vary considerably among firms, a typical company faces large fixed costs, sharply increasing short-run costs, and nearly constant average costs for moderate short-run output changes or substantial long-run changes. Smelting and refining, which account for the greatest proportion of costs in lead production are the greatest sources of pollution due to sulfur dioxide emissions and their relatively costly conversion to sulfuric acid. Lead consumption has increased at an annual rate of 1% due mainly to the battery industry, although a short-run decline in the tetraethyl market is expected. Because no close substitutes exist for lead, its demand is highly price inelastic, although inventory fluctuations associated with the business cycles and changes in capacity have caused periodic price instability. Increasing industry concentration is expected due to the introduction of large, high quality ore reserves in Missouri. A review of the industry indicates a natural division between high- and low-cost producers. (See also W73-14516) (Weaver-Wisconsin)

WATER AND WASTEWATER PLAN FOR ANDERSON, BLOUNT, AND KNOX COUNTIES, TENNESSEE - VOLUME I, WATER SUPPLY AND DISTRIBUTION.
Allen and Hoshall, Memphis, Tenn.

Report ET-SA-18-I-72 prepared for East Tennessee Development District, Knoxville, July 1972. 188 p, 18 fig, 59 tab, 2 append. CPA-TN-04-00-0136.

Descriptors: *Water supply, *Water distribution, Planning, Coordination, *Tennessee.
Identifiers: *Utility extension, *Knoxville SMSA, *Utility extension policies, Knoxville (Tenn), Anderson County (Tenn), Blount County (Tenn), Knox County (Tenn).

Water for the three-county Knoxville SMSA (Standard Metropolitan Statistical Area) is currently provided by twenty-eight separate utility systems, several of which provide inadequate service due to inadequate supply, inadequate treatment facilities, or inadequate distribution facilities. Only a few of these independent systems have formulated current or long-range plans regarding water supply and distribution. This study reports individually on the operations of each system. By means of population forecasts and land use maps, the study team predicted future water requirements in the area. Recorded flows show an abundance of surface water supply for the area's future needs. Land use and population projections would not justify a single regional water systems by 1990, but merger of several specific systems and establishment of three County Utility Boards to assure provision of recommended facilities in a coordinated and efficient manner are recommended. Cost estimates for each recommended project are given, and construction of specific facilities in each county at 5 year increments through 1990 is recommended. (See also W73-14683) (Stein-North Carolina)

WATER AND WASTEWATER PLAN FOR ANDERSON, BLOUNT, AND KNOX COUNTIES, TENNESSEE - VOLUME II, WASTEWATER COLLECTION AND TREATMENT.
Allen and Hoshall, Memphis, Tenn.

Report ET-SA-18-II-72 prepared for East Tennessee Development District, Knoxville, July 1972. 121 p, 8 plates, 30 tab, 4 append. CPA-TN-04-00-0136.

Descriptors: *Waste water treatment, *Sewerage, Septic tanks, Planning, *Tennessee.
Identifiers: *Waste water collection, *Knoxville (Tenn), Anderson County (Tenn), Knox County (Tenn).

Twelve wastewater utility systems now serve the three-county Knoxville SMSA (Standard Metropolitan Statistical Area), although public wastewater service is available only within municipal limits and in more densely inhabited areas of certain utility districts. Septic tanks are widely used, but present a hazard to the public welfare. Aside from insufficient territorial coverage, inadequacies of existing wastewater systems are attributable to excessive infiltration of surface water into collection systems or overloaded facilities brought on by new development. Few of the wastewater utility systems have current or long-range plans. High water-quality and effluent treatment standards promulgated by three state agencies constrain options for sewage treatment. Based on population and land-use forecasts, the study recommends specific wastewater service facility improvements through 1990. Population and land-use projections do not justify unified county systems, although County Utilities Boards are recommended to assure wastewater services on a coordinated, efficient basis. The study estimates costs of recommended projects and classifies all recommendations as short-range or intermediate-range priorities. Additional recommendations are county Sewer Use Ordinances and regulation of septic tanks. (See also W73-14682) (Stein-North Carolina)

BETTER WATER FOR PEOPLE IN LAS VEGAS,
Las Vegas Valley Water District, Nev.
T. R. Rice.
Journal of the American Water Works Association, Vol 65, No 4, p 229-231, April 1973. 3 photo.

Descriptors: *Water supply, *Water supply development, Pumping, Reservoir leakage, *Pollution abatement, *Nevada.
Identifiers: *Lake Mead (Nev), Southern Nevada Water Project, Las Vegas Valley Water District.

Although water for Las Vegas, whose population now exceeds 300,000 in the metropolitan area, originally came from several artesian wells, a lowered water table has long since caused the wells to cease their free flow. Today Las Vegas derives its water 57% from Lake Mead and 43% from well water. Since 1954, the Las Vegas Valley Water District has been operational as the prime supplier of water in Southern Nevada. Two years and over a million dollars have been spent for engineering and scientific studies of a water pollution problem caused by return flows entering Lake Mead via the Las Vegas Wash. A pollution-abatement program that will end pollution in Lake Mead and provide the means for reclaiming water for future use has been recommended to the state legislature. Unusual modern technology adopted by the Water District includes one of the largest gas-driven water-pumping stations in the world

and one of the largest rubber-lined covered reservoirs. Current 5-year expansion plans call for facilities costing $20 million to meet growing high per capita usage. (Stein-North Carolina)

DISPOSAL OF OIL SPILL AT SEA,
O. B. Lindstrom.
U. S. Patent No. 3,749,667, 2 p, 4 ref; Official Gazette of the United States Patent Office, Vol 921, No 5, p 1910, July 31, 1973.

Descriptors: *Patents, *Oil pollution, *Oil spills, Separation techniques, *Pollution abatement, Treatment, Water pollution control, Water quality control, *Waste disposal.
Identifiers: Oil disposal.

A method is provided of clearing up an oil spill by causing combustion of the burned oil to produce a cokey and tarry floating residue which can subsequently be sunk by adding a sinking agent to it. The sinking agent particles (less than 50 mm in size) should be spread over the burning oil. The particles become coated with the floating oil residue and dense enough to sink through the water. The sinking agent particles may be sand, gravel, chalk, gypsum, or slag of heavy minerals. (Sinha-OEIS)
W73-14690

METHOD AND APPARATUS FOR REMOVAL OF SURFACE LIQUIDS,
Megator Pumps and Compressors Ltd., London (England). (assignee).
F. W. McCombie.
U. S. Patent No. 3,748,264, 4 p, 1 fig, 5 ref; Official Gazette of the United States Patent Office, Vol 912, No 4, p 1530, July 24, 1973.

Descriptors: *Patents, *Oil spills, *Oil pollution, Equipment, Separation techniques, *Pollution abatement, Water quality control, Water pollution control, *Skimming.

The apparatus comprises a barrier which is extendable and forms an enclosure which may be contracted or extended as needed. It comprises a flotable support, a pair of drive drums mounted on the support, an elongated resilient barrier strip wound about each drum, a rear wall that forms a barrier, and a flotation element connecting the ends of the strips and the rear wall. The apparatus is completed by a skimming apparatus that forms the subject of U. S. Patent application Ser. No. 114,157. It can pump away the surface layer without removing an appreciable amount of the underlying liquid. A centrally placed suction pipe passing through a perforated strainer plate is surrounded by a circular weir. The lower end of the pipe is positioned in a dish shaped chamber below the plate. A principal objective of both inventions working together is to remove the surface layer of oil which may be in the form of a thin film. (Sinha-OEIS)
W73-14692

COALESCING FILTERS FOR OIL-WATER SEPARATORS,
Brunswick Corp., Skokie, Ill. (assignee)
G. B. Peters.
U. S. Patent No. 3,743,599, 2 p, 2 fig, 2 ref; Official Gazette of the United States Patent Office, Vol 912, No 1, p 273, July 3, 1973.

Descriptors: *Patents, *Oily water, *Separation techniques, Filtration, *Filters, Emulsions, *Pollution abatement, Water quality control, Water pollution control, Coalescence.

A coalescing filter for an oil-water separator comprises a pair of spaced flanges on a perforated tube which serves as the bobbin for coalescing windings. A winding of multifilament nylon twisted yarn completely encloses the perforated tube. The nylon winding is impregnated with an oleophilic resin which provides some mechanical stability to the winding and, more importantly, serves as a base for establishing an oil-resin membrane. (Sinha-OEIS)
W73-14699

VORTEX FLOW SYSTEM FOR SEPARATING OIL FROM AN OIL-WATER MIXTURE,
United Aircraft Corp., East Hartford, Conn. (assignee)
A. E. Mensing, J. W. Clark, and R. C. Stoeffler.
U. S. Patent No. 3,743,095, 7 p, 9 fig, 3 ref; Official Gazette of the United States Patent Office, Vol 912, No 1, p 152, July 3, 1973.

Descriptors: *Patents, *Oil spills, *Oil pollution, *Separation techniques, *Pollution abatement, Water pollution control, Water quality control.
Identifiers: Vortex flow system.

An oil-water mixture, which has been removed from the surface of an oil spill, is pumped into a vortex tube at one end at a very high flow rate so as to impart a strong swirl to the flow in the tube. A small circular coreplate is positioned within an aperture at the center of the opposite end of the vortex tube from which the mixture enters. As the mixture swirls axially toward the opposite end wall, the difference in centrifugal forces due to density differences between the oil and water tends to accelerate the less dense oil radially inward to form a core region almost entirely of oil. The oil leaves the vortex separator through a port in the center of the wall at the end of the vortex separator at which the mixture was injected. The flow surrounding the core, almost entirely water, leaves through the annulus in the downstream end wall and is returned to the body of water from which it was originally removed. (Sinha-OEIS)

06. WATER RESOURCES PLANNING

6A. Techniques of Planning

OPTIMIZATION OF WATER RESOURCE SYSTEMS INCORPORATING EARTHQUAKE RISK: 1973 CONTRIBUTIONS,
California Univ., Los Angeles Dept of Engineering Systems
C. M. Duke, and S. E. Jacobsen.
Available from the National Technical Information Service as PB-223 359, $4.25 in paper copy, $1.45 in microfiche. California Water Resources Center, Davis, Contribution No. 141, June 1973. 113 p, 20 fig, 13 tab, 48 ref. OWRR B-146-CAL (2), B-107-CAL (2), B-122-CAL (1), and B-144-CAL (2).

Descriptors: Earthquakes, *Earthquake engineering, Planning, *Project planning, *Damages, Probability, *California, *Optimization, Model studies, Costs, *Water distribution (Applied), *Attenuation, Optimal development plans.
Identifiers: San Fernando, Los Angeles, San Francisco.

A three-part report covers several phases of the project: (1) A renewal theoretic model is developed for the purpose of evaluating expected future damage costs due to earthquakes for a segment of a water distribution system located in a large seismic region. A probabilistic model is used to obtain expected future damage costs as a function of design intensity and a numerical example is included to indicate the usefulness of the methodology. (by S. E. Jacobsen, M. Torabi and P. B. Bansal). (2) Occurrence of earthquakes in terms of space, size, and time distributions is combined with site functions to establish probability of levels of earthquake intensity at given sites in the Los Angeles and San Francisco areas of California. The method is applicable for decisions on optimizing the routing of aquedicts or other systems extending over large areas subject to seismic disturbance. (by N. K. Anderson and C. M. Duke). (3) An attenuation formula was derived for the Arias instrumental intensity on bedrock and constants in the formula were calibrated for the San Fernando earthquake (1971), using eight bedrock spectra derived from surface accelerograms. From the constant differences between four constrained attenuation curves, it is possible to define site factors to be applied to bedrock intensity in order to estimate surface intensity for zoning purposes. (by K. W. Campbell and C. M. Duke). (Snyder-California)

MICROECONOMIC BEHAVIOR WHEN SUPPLIES ARE UNCERTAIN,
S. J. Turnovsky.
In: Models for Managing Regional Water Quality (ed. by R. Dorfman, H.D. Jacoby, and H.A. Thomas, Jr.), Harvard University Press, Cambridge, Mass., p 204-232 (Chapter 5), 1972. 2 fig, 23 ref.

Descriptors: *Economic analysis, *Decision making, *River basin commissions, *Water users, Behavior, *Water supply, Analytical techniques, Mathematical models, Prices, Consumptive use, Benefits, Stochastic processes, Design, Probability, Equations, Systems analysis, *Risks, *Regional analysis.
Identifiers: Public agencies, Micro-economic units, Production theory, Mean-variability analysis, Production function, Utility function.

In developing water resource projects, one must account for the inevitable fluctuation in system performance due to variation in streamflow, temperature, waste loads, equipment characteristics, and myriad other system inputs and parameters. Water users, in turn, respond to the level of uncertainty they experience, which affects the benefits that are propertly credited to alternative plans. Fairlure to consider this phenomenon can lead to serious errors in system design and evaluation. This is the first of a pair of articles which considers the special problem of uncertainty as it affects the design and operating decisions made by public agencies. This article explores the behavior of micro-economic units--households and productive farms--when the supply of some input is subject to uncertainty. A general, single-period model is developed which follows the mean-variability point of view and is essentially an extension of classical production (and consumption) theory. Then turning to the consumer, a parallel model is developed where the notation that previously referred to inputs is interpreted as applying to consumption goods. THE SOCIO-ECONOMIC DIMENSION OF WATER MANAGEMENT,
Battelle Memorial Inst., Columbus, Ohio. Regional Economics Div.
D. C. Sweet.
In: 'Dimensions of Water Management,' Proceedings of the 1st Annual Water Resources Conference, March 24, 1970, Columbus, Ohio, p 12-20, (1970). 2 fig.

Descriptors: *Optimum development plans, *Social values, Economics, Planning, Cost-benefit analysis, Administration, Water resources, Value, Decision making, *Management, Projections, Regions, River basin development, Economic impact, Model studies.
Identifiers: *Socio-economic impact, *Susquehanna River Basin, *Water management model.

An ideal water management methodology is described in order to provide a theoretical basis for evaluation and design of working processes. The Susquehanna River Basin model, an example of a water management process based upon the ideal, is presented. The elements which comprise the ideal system include inventory and compilation of data describing the various socio-economic, physical and ecological characteristics of the area. Thus, a notion of primary demand on existing water resources may be derived and compared with their potential for supply. The definition process of the goals for the system includes establishment of the social and economic value of various water resources. Finally, both the short- and long-run socio-economic impact of accomplishment of the goals must be estimated and evaluated. Cost-benefit analysis must be employed in selection of possible alternative means of achieving the prescribed goals. The Susquehanna River Basin model developed in Battelle-Columbus is considered as one of the few models which relates socio-economic components to the physical components of a water resource planning area. (Weaver-Wisconsin)
W73-14506

DES MOINES METROPOLITAN SANITARY SEWERAGE SYSTEM STUDY: PART B--MAIN SEWAGE TREATMENT PLANT.
Veenstra and Kimm, West Des Moines, Iowa.

Central Iowa Regional Planning Commission, Des Moines, December 31, 1971. 111 p, 8 fig, 12 tab, 5 appendices.

Descriptors: *Planning, *Sewage treatment, *Treatment facilities, Waste treatment, Forecasting, Alternative planning, Iowa, Financing, Tertiary treatment, Waste water treatment.
Identifiers: *Des Moines (Iowa).

Expansion of the sewage treatment plant to handle flows from all or parts of the Des Moines, Iowa, metropolitan area was investigated. This is part of a long-range comprehensive plan for collection and treatment of wastes in the Des Moines metropolitan area and covers topics of: (1) state and federal regulations, (2) the existing treatment plant, giving both existing loadings and capabilities, (3) future loadings predicted by type and geographical area, (4) recommendations as to routing and treatment of future loads, (5) alternative methods of providing additional treatment capacity, (6) construction cost estimates, and (7) financing costs of construction and operation. The existing plant was analyzed and found to be worth more than $12 million with a replacement value of over $20 million. It serves a population equivalent of the existing plant. (Poertner)
W73-14529

COMPREHENSIVE WATER AND SEWER PLAN: FREDERICK COUNTY, MARYLAND, VOLUME I.
Beavin Co., Baltimore, Md.

Frederick County Planning and Zoning Commission, Frederick, Maryland, 1969. 83 p.

Descriptors: *Planning, *Data collections, *Water supply, *Sewerage, Sewage treatment, Water treatment, Forecasting, Maryland, Comprehensive planning, Water resources development, Regional development, City planning.
Identifiers: Frederick County (Maryland).

A comprehensive water and sewer plan was prepared for Frederick County, Maryland. Existing systems were inventoried, projections were made of probable future demands, and recommendations for future systems are given. Total 1967 population was 92,100, and is expected to grow to 126,800 by 1980, 209,900 by the year 2000 and 2,127,000 by year 2070, at which time the county will be fully developed. The county has an area of about 670 square miles, of which approximately 34% is forest. Rainfall is about 42 inches a year, and is well distributed throughout the year. Water supplies are from the groundwater which is of good quality. Surface water is not used since streamflow is too dependent on rainfall. However, future development of water supplies calls for stream impoundments as well as further development of groundwater. A system of 20 water filtration plants is recommended, with interconnections to form a country-wide system. In 1969, about 50 percent of Frederick County was served by sewers. Water quality in the Monocacy River below the sewage treatment plant is presently unsatisfactory. Besides this plant, other sources of pollution comes from farm animals. A country-wide system of 28 treatment plants if recommended. Plants should remove at least 90 percent of the BOD; effluents should be used, rather than merely discharged; and animal sanitation should be improved. (Poertner)
W73-14530

METROPOLITAN COMPREHENSIVE WATER, SEWAGE, AND SOLID WASTE PLANNING: VOLUME I--BACKGROUND.
Bi-State Metropolitan Planning Commission, Rock Island, Ill.

March, 1970. 139 p, 17 fig, 22 tab, 1 appendix.

Descriptors: *Planning, *Water supply, *Sewerage, *Sewage treatment, *Solid wastes, Comprehensive planning, Iowa, Illinois, Forecasting, Water resources development, Data collections, Regional development, City planning, Short-term planning, Long-term planning, Legal aspects, Geologic investigations.

A comprehesive inventory and analysis was made of water, sanitary sewerage, storm drainage and solid waste systems in the two-county, two-state planning region of the Bi-State Metropolitan Planning Commission. The region includes Scott County, Iowa and Rock Island County, Illinois. It covers 873 square miles and is bisected by the Mississippi River. Total population in 1967 was about 296,000 and is expected to increase to about 353,000 by 1985. This study covers the following topics: (1) an inventory of the existing facilities in every community in the planning area; (2) a determination of future utility needs; (3) an inventory of local geologic conditions; (4) an inventory of pertinent federal, state, and local legislation; (5) an analysis of the existing facilities in light of future needs, geologic conditions, and present legislation; (6) preparation of a comprehensive 1985 plan based on the analysis; and (7) formulation of a short-range development program to implement the plan to 1975. This volume covers background material relevant to the study, including: (1) applicable state, federal and local laws, (2) federal agencies doing work in the subject areas, (3) federal grants-in-aid, (4) physical features in the study area, (5) methodology used for predicting future needs, (6) goals and objectives of the types of service studied. (Poertner) (See also W73-14532 and W73-14533)
W73-14531

METROPOLITAN COMPREHENSIVE WATER, SEWAGE, AND SOLID WASTE PLANNING STUDY: VOLUME II--INVENTORY ANALYSIS AND PLAN.
Bi-State Metropolitan Planning Commission, Rock Island, Ill.

March, 1970. 323 p, 74 fig, 35 tab, 1 append.

Descriptors: *Planning, *Water supply, *Sewerage, *Sewage treatment, *Solid wastes, Comprehensive planning, Iowa, Illinois, Forecasting, Water resources development, Data collections, Regional development, City planning, Short-term planning, Long-term planning, Legal aspects, Geologic investigations.

The Bi-State Metropolitan Planning Commission prepared this report to inventory and analyze existing water supplies, sanitary sewerage, storm drainage, and solid waste disposal. This report includes the following: (1) an inventory of the existing facilities in every community in the planning area: (2) a determination of future utility needs; (3) an inventory of local geologic conditions; (4) an inventory of pertinent federal, state, and local legislation; (5) an analysis of the existing facilities in light of future needs, geologic conditions, and present legislation; (6) preparation of a comprehensive 1985 plan based on the analysis; and (7) formulation of a short-range development program to implement the plan to 1975. This volume contains the inventory and analysis of existing systems and the plan for future systems. In 1967, the population of the 873 square mile region was about 296,000; by 1985 it is expected to grow to about 353,000. About 80 percent of all water comes from the Mississippi River and a problem is arising from the pollution by coliform bacteria, which has increased over 6 times from 1959 to 1964. It is recommended that existing water treatment plants be expanded to serve all areas within the central urbanized areas with water from the Mississippi River. Sanitary sewage facilities serve about 260,000 people, providing various levels of sewage treatment. Expansion of the service areas is recommended. Storm sewer plans call for separation of sewers in the large communities--the smaller communities are financially incapable of providing such sewers. Detailed study of solid waste problems is recommended. (Poertner) (See also W73-14531)
W73-14532

METROPOLITAN COMPREHENSIVE WATER, SEWAGE, AND SOLID WASTE PLANNING STUDY: VOLUME III--SHORT-RANGE DEVELOPMENT PROGRAM.
Bi-State Metropolitan Planning Commission, Rock Island, Ill.

March, 1970. 75 p, 35 tab.

Descriptors: *Planning, *Water supply, *Sewerage, *Sewage treatment, *Solid wastes, Comprehensive planning, Iowa, Illinois, Forecasting, Water resources development, City planning, Regional development, Short-term planning, Legal aspects, Geologic investigations.

The Bi-State Metropolitan Planning Commission, prepared a study on an inventory, analysis and plans for water, sanitary sewerage, storm drainage, and solid waste management. This volume covers the short-range development plan of the program which included the following topics: (1) an inventory of the existing facilities in every community in the planning area; (2) a determination of future utility needs; (3) an inventory of local geologic conditions; (4) an inventory of pertinent federal, state, and local legislation; (5) an analysis of the existing facilities in light of future needs, geologic conditions, and present legislation; (6) preparation of a comprehensive 1985 plan based on the analysis; and (7) formulation of a short-range development program to implement the plan to 1975. The report is composed of three major sections: (1) financial resources available, including current revenues, methods of borrowing, grants-in-aid and other financial considerations; (2) specific program proposals for 1970-1975, covering 453 projects costing a total of $83,146,000 (excluding solid waste management); and (3) additional general and specific program recommendations. Two major concepts recommended are: (1) enactment and enforcement of ordinances relative to the subject matter of this study, and (2) increased cooperation of local jurisdictions to solve common problems. (Poertner) (See also W73-14531)
W73-14533

WELLESLEY -- A CASE STUDY OF THE WATER RESOURCE PROBLEMS OF A GROWING SUBURBAN MUNICIPALITY,
Boston Univ., Mass. Dept. of Hydrogeology.
D. S. Hunnewell.
May 21, 1973. 40 p, 18 ref.

Descriptors: *Water resources development, *Forecasting, *Planning, *Water demand, *Water supply, Massachusetts, Water requirements, Dependable supply, Water shortage, Imported water, Political aspects, Institutions, Urbanization, Water contracts, Conservation.
Identifiers: *Wellesley (Massachusetts), Boston (Massachusetts).

The Town of Wellesley, Massachusetts, is an example of a town faced with an impending water shortage. An earlier study by a professional engineering company recommended that Wellesley develop additional groundwater supplies rather than join the Metropolitan District Commission of Boston. However, the State Attorney General ruled that these groundwater supplies were previously unused by Wellesley, and therefore, under State law, could not be developed. Furthermore, the State Department of Public Health ruled that the proposed wells: (1) were too close to existing sewers, thereby risking contamination, and (2) would lower water levels in a river which already was being artificially augmented. The alternative -- joining the MDC -- is not without problems since the cost of water is $120 per million gallons compared to the Wellesley rate of $40 per million gallons and the MDC is also facing possible water shortages in the near future. Wellesley is currently served by 7 wells with a sustained yield of 6.1 mgd, with projected demands for 1990 ranging from 5.0-5.3 mgd for an average, and maximum daily demands of about 9.25-9.81 mgd. A local conservation group has been formed and is promoting the conservation of water both voluntarily and through changes in water rates. Another study suggests that State laws and regulations on water development within the MDC are antiquated and Wellesley should be allowed to develop the wells recommended in the engineering study. (Poertner)

COMPREHENSIVE WATER AND WASTEWATER PLAN, 1969.
Baltimore City Dept. of Public Works, Md. Bureau of Engineering.

August 31, 1970. 86 p, 12 fig, 5 tab, 5 appendices.

Descriptors: *Comprehensive planning, *Water supply, *Sewerage, *Sewage treatment, Forecasting, Maryland, Water resources development, Water delivery, Water demand, Construction.
Identifiers: *Baltimore (Maryland).

A comprehensive water and wastewater plan was developed for the City of Baltimore to guide future development. Annual revisions of the plan are specified for presentation at public hearings, adoption by the mayor and city council, and approval by the State Health Department. The City of Baltimore derives its water from three surface sources--two reservoirs and the Susquehanna River. Three water treatment plants have a combined capacity of 360 mgd. Water distribution covers all of the City of Baltimore and parts of 3 adjacent counties, covering about 220 square miles. By the year 2000, it is estimated that the service area will cover about 700 square miles and will rely on increased water usage from the Susquehanna River. Recommended improvements to 1977 total $38,054,300 including $12 million for improvements to water filtration plants and over $19 million for improvements and extensions to water transmission mains. Pollution of Baltimore's waters is from 9 sources including: (1) commercial and industrial discharges, (2) septic tanks, (3) malfunctioning or inadequate treatment plants, (4) illegal sewer connections, (5) storm runoff, (6) marine craft, (7) leaching from dumps and landfills, and (8) natural sources. Significant commercial and industrial sources are known and efforts are being made to reduce this pollution. Other programs are directed against other forms of pollution, including upgrading of present treatment plants. (Poertner)

REPORT ON REGIONAL WASTEWATER TREATMENT FACILITIES FOR THE FREDERICK METROPOLITAN AREA, FREDERICK COUNTY, MARYLAND.
Baker-Wibberley and Associates, Inc., Hagerstown, Md

Frederick County Metropolitan Commission, Frederick, Maryland, January 31, 1973. 36 p, 3 fig, 7 tab.

Descriptors: *Planning, *Sewage treatment, *Treatment facilities, *Regional development, Alternative planning, Maryland, Waste water treatment, Financing.
Identifiers: *Frederick County (Maryland).

Various methods of providing additional wastewater treatment capacity to the Frederick, Maryland metropolitan area were studied and evaluated. The Frederick metropolitan area is projected to experience rapid growth with the area reaching almost total development by year 2000. Population in 1970 was about 38,500 and is expected to reach 169,000 by 2010. Wastewater flows were about 5.35 mgd in 1970, and in 2010 flows are expected to be about 17.70 mgd. The present treatment plant serving the City of Frederick is expected to be used to total capacity within 5 to 10 years. Four alternate sites were examined for sewage treatment plants along the Monocacy River. On the basis of cost, the most economical site was chosen and the report recommends that land acquisition and design begin immediately. Treatment by the activated sludge process is recommended, along with sludge incineration. Cost of the system is estimated at $5,881,000 (exclusive of land) for a plant capacity of 6.0 mgd, and federal and state grants of 87.5 percent of this cost are available. As an interim measure, it is recommended that suburban areas be allowed to hook up to the City of Frederick treatment plant. (Poertner)

BASIC CONCEPTS IN SYSTEM PLANNING OF WATER RESOURCES,
Roorkee Univ. (India). Water Resources Development Training Centre.
M. K. Singhal.
Indian Journal of Power and River Valley Development, Vol 23, No 2, p 36-38, February 1973. 1 fig, 5 ref.

Descriptors: *Water resources, *Planning, *Systems analysis, *Optimization, Simulation analysis, Storage, Dams, Reservoir releases, Economic efficiency, Linear programming, Decision making, Methodology, Computers, Analytical techniques, Mathematical models, *Optimum development plans.

Man is confronted with the problem of planning in the face of increasingly limited resources. The concept of system planning provides a powerful tool for optimal planning of water resources. A system is defined as an integrated assembly of independent and interdependent components designed to carry out a predetermined function. The development of the systems approach is traced and its use illustrated by formulating a simplified mathematical model which uses linear programming and simulation analysis for hypothetical planning of a storage dam. Types of mathematical models are discussed and the steps in system planning are outlined. The hypothetical planning problem is to determine the desirable storage and the target annual output reservoir release for achieving economic efficiency. (Bell-Cornell)

INVESTMENT CRITERIA AND MATHEMATICAL MODELLING TECHNIQUES FOR WATER RESOURCES PLANNING IN ARGENTINA: THE MIT-ARGENTINA PROJECT,
Massachusetts Inst. of Tech., Cambridge. Dept. of Civil Engineering.
D. C. Major.
In: Systems Approaches to Developing Countries, Proceedings of Symposium, sponsored by International Federation of Automatic Control and the International Federation of Operational Research Societies, Algiers, Algeria, May 28-31, 1973, p 235-239, 1973. 2 fig, 11 ref.

Descriptors: *Water resources, *Planning, *Mathematical models, *River basins, Irrigation, Water supply, Hydrologic models, Simulation analysis, Stochastic processes, Investment, Management, Economics, Research, Social aspects, Systems analysis.
Identifiers: *Argentina, Rio Colorado, Power production, Developing countries.

A research program at MIT for the application of modern investment criteria and mathematical modeling techniques for water resources planning in Argentina is described. The project lasted for two years and had three principal objectives: (1) To adapt modern water resources planning techniques to Argentina; (2) to train Argentine professionals in the use of these techniques; and (3) to apply the techniques to a basin in Argentina for the purpose of developing alternative management and development plans for the river responsive to alternative economic and social objectives. The key organizational features of the MIT-Argentina program are described; the nature of modern water resources planning methods is outlined, the two central elements being multiobjective planning and the combined use of mathematical programming models and hydrologic simulation models. The basin selected for study is the Rio Colorado where present purposes of development are creating and enlarging irrigated zones and producing power. A description is presented of the system models used in the case study. Included are: A mathematical programming screening model to find configurations testable for hydrologic feasibility by the second model, a hydrologic simulation model; and a mixed integer 'sequencing' model utilizing the results of the first two models to develop the appropriate scheduling of hydrologically feasible projects over time. (Bell-Cornell)

CONSTRAINTS AND STRATEGIC CHOICES IN WATER SUPPLY INVESTMENT,
Wye Coll., Ashford (England). School of Rural Economics and Related Studies.
I. D. Carruthers.
In: Systems Approaches to Developing Countries, Proceedings of Symposium, sponsored by International Federation of Automatic Control and the International Federation of Operational Research Societies, Algiers, Algeria, May 28-31, 1973, p 225-234, 1973. 5 fig, 1 tab, 6 ref.

Descriptors: *Water supply, *Investment, *Constraints, *Management, *Domestic water, *Decision making, Rural areas, Systems analysis, Public utilities, Economics, Engineering.
Identifiers: *Kenya (Africa), Developing countries, Resource scarcity.

Systems analysis appears to offer considerable operational value for the domestic water supply sector. This contention is examined in the context of the Kenya rural water program. Three aspects of the program are considered: (1) changes in the input mix; (2) changes in the process for installing and maintaining schemes; and (3) the requirements for feedback. It is concluded that the concepts, as well as the methods, of systems analysis would provide useful management input in a sector where technical engineering considerations tend to dominate decision making. It is found that special conditions obtain requiring more capital intensive methods, a new approach to budgeting, institutional evolution leading to a strong provincial organization, and a more comprehensive feedback of information to policy makers and management. (Bell-Cornell)
W73-14671

GUIDELINES FOR SYSTEMS PLANNING INVESTIGATIONS AND OPTIMUM UTILIZATION OF WATER RESOURCES AND NORMS IN A DEVELOPING AREA,
Madhya Pradesh Government Control Board for Major Projects, Bhopal (India).
D. R. Sikka.
In: Systems Approaches to Developing Countries, Proceedings of Symposium, sponsored by International Federation of Automatic Control and the International Federation of Operational Research Societies, Algiers, Algeria, May 28-31, 1973, p 463-465, 1973.

Descriptors: *Water resources, *Optimum development plans, *Alternative planning, *Systems analysis, River basins, Water utilization, Economics, Engineering, Management, Decision making, Mathematical models.
Identifiers: *Developing countries, Power planning.

In planning water resource projects in developing countries, it is necessary to account for the size and scope of the needs of the area. The planning involves a large number of choices, assumptions and uncertainties in both engineering and economics; even after accounting for the technological constraints of topography and location, several alternative schemes of development with varying capacities and operating policies, technological features, and time streams of development are possibilities for meeting the various water derivative demands. These have to be considered in totality and in conjunction with power planning. Systems approach presents a variety of possible alternatives and their economic consequences, permitting optimal choice balancing the interest of the individual states as well as the region as a whole. Objectives of a proposed water resources systems study are enumerated; input and system studies are listed; and river basin planning for optimum water use and supplies, and area size for water resource exploitation are discussed. Needed are: (1) clear quantification of a country's size and time factors of growth rate; (2) an integrated management authority; (3) development under short, medium and long-term measures; (4) data collection and release programmes; and (5) development of surface and sub-surface waters according to time and finance limitations, for consumptive and non-consumptive uses. 6B. Evaluation Process

A STUDY OF MANAGERIAL PRACTICES IN RURAL WATER SYSTEMS,
University of Southern Mississippi, Hattiesburg. Bureau of Business Research.
P. Cartee, and D. C. Williams, Jr.
Available from the National Technical Information Service as PB-223 373, $4.50 in paper copy, $1.45 in microfiche. Mississippi State University, Mississippi State Water Resources Research Institute Report, July 1973. 125 p, 1 fig, 20 tab, 18 ref, 3 append. OWRR B-008-MISS (1).

Descriptors: *Management, Water supply, *Rural areas, *Mississippi, *Water management (Applied), *Operation and maintenance, Costs.
Identifiers: *Farmers Home Administration.

The rural community water system program of the Farmers' Home Administration was initiated in Mississippi in late 1962. The number of systems has grown until the total is now over 580, the second largest of all the states. Due to the rapid growth and the changing demands and standards placed on the systems, a study of the systems' managerial practices was deemed appropriate. Although many positive aspects were observed in the management of the systems, the emphasis was directed toward deficiencies in management. Specific deficiencies noted were: water operator qualifications and training; water quality surveillance and lack of in-house testing programs; cross-connection prevention programs; inflated initial memberships used in determining system feasibility; and lack of adequate internal business controls. Also of concern to this study were the relation of operating and maintenance costs per user to system size, the relation of contracted to in-house costs of operations and maintenance, and a case study of the effectiveness and efficiency of combining systems.
W73-14208

SOCIOLOGICAL DIMENSIONS OF LEISURE INVOLVEMENT IN WATER-BASED RECREATION,
Washington Univ., Seattle. Coll. of Forest Resources.
D. R. Field.
Available from the National Technical Information Service as PB-223 349, $3.50 in paper copy, $1.45 in microfiche. Project Completion Report, July 1973. 43 p, 2 fig, 11 tab, 67 ref. OWRR A-047-WASH (2).

Descriptors: *Social aspects, Methodology, *Recreation demand, *Attitudes, *Behavior, *Social participation, Motivation.
Identifiers: *Leisure, Social aggregate variables.

A baseline study was designed to identify essential sociological dimensions of participation in water-based activities. Objectives were: (1) To identify social groups participating in water-based recreation, as well as the social and economic characteristics of user-nonuser populations, (2) To identify variation among social groups participating in specific water-based recreation activities, (3) To determine in what manner involvement in specific water-based recreation is complementary or divergent from involvement in other outdoor leisure pursuits, (4) To compare similarities and differences among water-based recreational users and nonusers in terms of involvement in general patterns of leisure behavior. While data about user-nonuser populations were scarce, the general relationship of differences in terms of socio-demographic characteristics continued to be valid. With the wealth of data regarding participation, the question arose: why were predictive models of recreational demand misleading. The current research emphasis was shifted toward a systematic analysis of those factors associated with participation in a selected set of water-based activities wherein the results would have meaning for improving the predictive capabilities of models designed to measure recreation demand.

THE VALUE OF INFORMATION IN MAKING PUBLIC DECISIONS,
New Mexico Univ., Albuquerque. Dept. of Economics.
W. R. Porter.
Intermountain Economic Review, (1971). p 26-40, 1 fig, 3 tab, 9 ref. OWRR A-017-NMEX (1).

Descriptors: Model studies, *Costs, Planning, *Decision making, *Cost benefit analysis, *Benefits, Water resources development, Value.
Identifiers: Information value.

A viable and efficient sequential decision model was developed and tested which integrated information cost and stochastic benefits into the basic benefit-cost analysis for water resource project development. Given the very high costs of obtaining reliable estimates of benefits for water resource projects such a model could be very useful to government agencies wishing to get accurate benefit measurements but constrained by a limited budget for such information.

THE ROLE OF URBAN ENGINEERING IN THE NATIONAL WATER POLICY ASSESSMENT,
National Water Commission, Arlington, Va. Engineering and Environmental Sciences Div.
A. B. Bigler, and J. E. Flack.
September, 1971. 54 p, 2 append. OWRR A-013-COLO (2).

Descriptors: Engineering, *Systems analysis, *Water management, Model studies, Information exchange, Coordination.
Identifiers: *Interdisciplinary approach.

With the emergence of interdisciplinary approaches to help solve urban problems it has become necessary to clearly define the role of specific disciplines and the interrelationships among them. Engineering is basically responsible for physical-technological aspects of urban areas. Engineers have often been negligent of social and aesthetic issues but as members of a larger team looking at the total environment these problems can be overcome. As members of an interdisciplinary team, engineers would provide physical and operational criteria, alternative technical courses of action, and information on technological consequences. The team would take a systems analysis approach but there is a great need for 'social engineering' skills to catch up with physical engineering and model building. A model for integrated urban water management is proposed which consists of two key features: a water resources advisory service which acts as a focal point for research and social information, and an interdisciplinary team using a system analysis approach to plan an integrated water management system. SHORELINE ANALYSIS OF THE CITY OF SARASOTA.
Smally, Wellford and Nalven, Sarasota, Fla.

Prepared for the Tampa Bay Regional Planning Council, May, 1970. 149 p, 10 fig, 46 ref. HUD Florida P-109.

Descriptors: *Shorelines, *Aesthetics, *Preservation, Land use, Urbanization, Shore protection, Environmental effects, Controls, Regulations, *Florida.
Identifiers: Shoreline preservation, *Sarasota (Fla), Shoreline impact zones.

A planning background and framework is provided for the maintenance of the special character and attractiveness of the Sarasota shoreline. The report is divided into three main parts: (1) a historical sketch of the development of the shoreline area including natural physical processes, Indian settlements, and the most recent urbanization processes; (2) a comprehensive look at the trends in land use and water use of specific areas of the shoreline and the Bay; and (3) a presentation of concepts and possible controls for the future development of the area. The basic finding is that the quality of the shoreline at present is very good but that planning and guidance is necessary to maintain this state. Various concepts and regulations are proposed: (1) delineation of shoreline impact zones, i.e. the strip of land directly on the waterfront plus an adjacent strip extending a fairly short distance inland, (2) concept of visual access be elevated to approach a public right, (3) controls for boating uses; (4) planned use of dredging spoil to create public islands, (5) protection of the bay ecosystem with special attention to halting pollution; and (6) updating of city code to control construction. THE GRAND TRAVERSE BAY SPORT FISHERY: ANGLER ACTIVITY, REVENUE, AND ECONOMIC IMPACT,
Michigan Univ., Ann Arbor. School of Natural Resources.
J. M. Kapetsky, and J. R. Ryckman.
Available from NTIS, Springfield, Va 22151 as COM-73-10462 - Price $3.00 printed copy; $1.45 microfiche. Michigan University Sea Grant Technical Report No 34, January 1973. 32 p, 2 fig, 7 tab, 11 ref. MICHU-SG-B-201.

Descriptors: *Sport fishing, *Freshwater fish, *Michigan, *Bays, *Economic impact, Water resources development, Recreation facilities, Tourism, Community development.
Identifiers: *Grand Traverse Bay (Mich).

Over a 1-year period, from May 1971 to May 1972, sport fishing activity in Grand Traverse Bay, Michigan, amounted to an estimated 69,000 angler days. Visitors to the area expended more than two-thirds of total angler activity. An estimated $418,000 of gross income attributable to the fishery resource accrued to the three-county community adjacent to the bay over the 1-year period, mostly from anglers using public launching sites and from charter fishermen. Net income to the community from sport fishing was estimated at $203,000. Business activity generated by sport fishermen created an estimated 21.5 full-time equivalent jobs which were attributable to the fishery resource. Included in the community are Antrim, Grand Traverse, and Leelanau Counties,

with a combined population of nearly 63,000 (U.S. Bureau of Census, 1970). Traverse City, at the southern end of the west arm of the bay, is the economic and cultural center of the community, with a population of about 18,000 (U.S. Bureau of Census, 1970). Tourism and recreation rank with manufacturing as leading economic activities in the region. (Woodard-USGS)

PIGEON LAKE, PLANNING A RECREATIONAL RESOURCE.
Battle River Regional Planning Commission (Alberta).

December 1966. 27 p, 1 tab, 18 maps.

Descriptors: Recreation, *Recreation facilities, *Land use, *Planning, *Canada, Local governments.
Identifiers: *Resort community, Development plan, Local government reorganization, Implementation, Battle River Region (Alberta), Wetaskin County (Alberta), *Pigeon Lake (Alberta).

Pigeon Lake, a 35.25 square mile spring fed area with a water shed extending an average of 3 miles back from shore, is approximately 40 miles southwest of Edmonton and within a one hour time/distance radius with a total population of 458,000 of which 405,000 is urban. As background for the proposals developed, the study outlines related regional facilities including nearby lakes and means of access, existing land use area around the lake, density of current resort development along the edge, and the nature of existing land use controls. General principles of physical development are stated and a general recreational development plan is proposed, dealing with not only Pigeon Lake but also Battle and Wizard Lakes. Private and general public resort development is restricted to specific parts of the lakeshore, areas for wilderness recreational use are suggested, and much of the remaining shoreline would remain devoted to agricultural uses. A secondary road network is layed out. Requirements for adequate implementation of these proposals are explored with implications for the form of local municipal organization and a request that the Provincial Department of Municipal Affairs critically appraise the establishment of a new system of resort community government. Specific recommendations and numerous maps are included. (Edwards-North Carolina)

MASTER PLAN FOR STORM DRAINAGE: FORT WAYNE-NEW HAVEN-ALLEN COUNTY METROPOLITAN AREA.
Schnelker (Philip L.), Inc., Fort Wayne, Ind.

Prepared for The Three Rivers Co-ordinating Council, April 1972. 174 p, 5 fig, 4 tab, 16 plates, 3 append. CPA-IN-05-00-0130.

Descriptors: *Storm drains, *Storm runoff, *Rainfall-runoff relationships, Forecasting, Rational method, Urbanization, Land use, Watersheds, Design criteria, Correlation analysis, *Indiana.
Identifiers: Allen County (Ind.), Fort Wayne (Ind.), New Haven (Ind.).

A plan is formulated for the construction and improvement of all necessary storm drainage systems in Allen County, Indiana. Storm drainage systems must be built far in advance of full urban development; they will help facilitate orderly development. Focus is on forecasting future storm runoff, especially in relation to changing land use, and the engineering design of the systems. With regard to design criteria, such topics as runoff estimating methods, rainfall-runoff relationships, time of concentration criteria, and roughness coefficients are discussed. A detailed presentation is included of the runoff forecasting procedure used for the small watersheds in the county. Three basic methods were used: (1) interpolation of flood-frequency analyses was used for gaged streams; (2) modification of the Rational Formula method was used for ungaged basins of 500 acres or less; and (3) a Correlation Method, developed for the study, was used for basins over 500 acres. In the last two methods the key parameters used for local modification were drainage area, length of principal channel, vertical fall of principal channel, soil type, and projected land use. EXTENDING THE ST. LAWRENCE SEAWAY NAVIGATION SEASON: THE COST-BENEFIT APPROACH,
Wisconsin Univ., Milwaukee. Dept. of Economics.

Descriptors: *St. Lawrence Seaway, *Navigation, *Cost-benefit analysis, *Ice, Technology, Economic impact, Transportation, Economic efficiency.
Identifiers: *Navigation season extension, Shipping.

Winter close-down prevents the St. Lawrence Seaway from realizing its true potential as a full service, low cost transportation route. Such close-downs weaken the Seaway's competitive position with overland-seaboard routes used as alternatives. A cost-benefit analysis, based on available data, of the possible extension of the operating season for two, four, and six weeks is presented. Coast Guard estimates of costs for season extension are employed because of their separation of ice breaking costs, construction costs, and increased annual costs. Estimated economic benefits include: cost savings for present traffic, the increased regional income due to new traffic, impact of diverted traffic, and the savings on the stockpiling of bulk cargo not shipped during the winter close-down. A four week extension was found to be the minimum necessary to generate significant transportation savings, although longer extensions are also economically justified. (Weaver-Wisconsin)

EFFECTS OF FISHING AND HUNTING EXPENDITURES ON A LOCAL COLORADO ECONOMY,
Montana Univ., Missoula. School of Forestry.
R. E. Lovegrove, and D. D. Rohdy.
The Annals of Regional Science, Vol 6, No 2, p 108-116, 1972. 4 tab.

Descriptors: *Economic impact, *Recreation, *Fishing, *Hunting, Regional economics, Model studies, Input-output analysis, Income analysis, Evaluation, *Colorado.
Identifiers: Game management, *Grand County (Colo.), Multiplier estimation, Impact optimization.

In order to both satisfy ever increasing demand for fishing and hunting and maximize economic impact of these activities, fish and game authorities must determine efficient expenditure schemes based on knowledge of the specific economic impacts of alternative public expenditures. The recreational impact is evaluated using a three-phase methodology based on data compiled from Grand County, Colorado. The methodology includes: (1) construction of an interindustry model of the country for 1968, (2) estimation of expenditures directly related to the pursuit of the sport (s), and (3) estimation of the total economic impact through consideration of both (1) and (2). Income multipliers were derived from the interindustry model. Results from mail questionnaires led to the estimation of sportsmen expenditures which indicated that fishermen, in aggregate, spent nearly eight times as much as hunters. Final analysis indicates that fishing accounted for 11.1% and hunting 1.4% of total economic activity in the county and that jointly they generated 21% of total direct, indirect, and induced household income. CLUSTER ANALYSIS AND WATER PROJECT EVALUATION,
South Dakota State Univ., Brookings. Dept. of Economics.
J. E. Wiebe.
Water Resources Bulletin, Vol 8, No 6, p 1189-1197, 1972. 10 fig, 1 tab, 2 ref.

Descriptors: *Project benefits, *Welfare (Economics), *Evaluation, Regional economics, Economic impact, *Tennessee River, Income, Employment, Water resources development.
Identifiers: *Cluster analysis.

Large-scale water projects are designed to generate positive economic and social benefits at their site. This study tested the hypothesis that income and employment benefits would be positively related to the areas where the projects were located. The research area was a 120-county region of the Tennessee River Watershed in the geographic location of the Tennessee Valley Authority. Cluster analysis was used to delineate counties in the watershed on the basis of changes in selected variables over time, weighted and divided for analysis into ten different combinations; these included 'Per capita income,' 'Total income,' 'Total employment,' 'Capital invested in manufacturing,' 'Percentage total population 25 years old and over with no school,' 'Percentage total population 25 years old and over with at least one year of college education,' and 'Percentage population in income category of $7000 and over.' Conclusions indicate that economic benefits can be assummed to be regional and not pronounced in counties adjacent to TVA. (Weaver-Wisconsin)

ECONOMIC EVALUATION OF SPORT FISHERIES--WHAT DO THEY MEAN,
Slaney (F. F.) and Co. Ltd., Vancouver (British Columbia).
D. Gordon, D. W. Chapman, and T. C. Bjornn.
Transactions of American Fisheries Society, Vol 102, No 2, p 293-311, 1973. 4 fig, 13 tab, 23 ref.

Descriptors: *Recreation, *Fishing, *Value, *Economic impact, *Idaho, Decision making, Welfare (Economics), Resource allocation, Evaluation, Social values, Analytical techniques.
Identifiers: Demand estimation, Consumer surplus.

Techniques for valuation of sport fisheries were reviewed, compared and evaluated using a 1968 survey of anglers in Idaho. Based on the survey, the following measures of economic impact were estimated; (1) gross annual expenditures by sport fishermen, (2) net value and consumer surplus of various high quality sport fishery resources in Idaho, and (3) distribution of resident and non-resident fishing effort in the state. The survey provided daily expenditures and total days fished from which transfer costs spent by anglers were estimated, and demand curves simulated for eight fisheries in Idaho. On the basis of these curves maximum revenue (net value) and consumer surplus at the optimum daily angler fee were estimated. Results indicate a total net value of approximately $4.7 million and consumer surplus of $9.4 million associated with the eight fisheries. Comparison of techniques and results of the present study to others suggests that more consistent procedures would improve comparability of results. Although resource value was found to be unsatisfactorily estimated by gross expenditures, capitalized values may be useful. User-oriented worth of a fishery if were owned and marketed by a monopolist were approximated by estimates of net worth. (Weaver-Wisconsin)

A RATIONALE FOR THE REGIONALIZATION OF PUBLIC WATER SYSTEMS,
Environmental Protection Agency, Washington, D.C. Div. of Water Supply.
K. A. Boyd, and F. A. Bell, Jr
Water Resources Bulletin, Vol 9, No 1, p 73-80, 1973. 1 fig, 3 tab, 18 ref.

Descriptors: *Water works, *Potable water, *Consolidation, *Economic efficiency, Regions, Water rates, Public utilities, Legislation, Water delivery, Water quality standards, Cost analysis, Public health, *Regional analysis.
Identifiers: Small water utilities, Water service.

Studies of community water supply systems indicate that small systems have significantly more problems in their construction, operation, and in achievement of national Drinking Water Standards than do larger systems. The problem of analysing the economics of water service was simplified by studying costs of service, divided into personnel costs and capital costs, and water service rates for five example systems. In so doing, a rationale is set forth for requiring and/or encouraging the consolidation or regionalization of all systems serving populations beneath certain sizes. Minimal population sizes would be determined based on the small water systems' capability to produce an adequate supply of safe drinking water at reasonable cost. Estimates of basic costs and a range of water rates, thought to be acceptable to the customer, are used to determine public water system sizes which might be expected to achieve fiscal viability. Policy recommendations include both state and federal review of the extent and severity of small public water system problems and their resolution through consolidation or regionalization. (Weaver-Wisconsin)

WATER FOR THE FUTURE,
Ohio Agricultural Research and Development Center, Wooster.
T. L. Napier.
Ohio Report, Vol 58, No 2, p 57-59, 1973. 3 tab.

Descriptors: *Water resources development, *Sites, *Relocation, *Population, *Rural sociology, Social aspects, Social adjustment, Social impact, *Ohio, *West Virginia, Impoundments, Water supply, *Social impact.
Identifiers: Social attitudes, Social alienation, Watershed development.

The social-psychological impact of the expansion of water impoundments and subsequent population relocation upon rural community groups in Ohio and West Virginia were studied. The specific hypothesis tested stated that watershed development resulted in an alienated population. Four communities, carefully chosen to ensure comparability of the community groups, were sampled on a systematic random sample basis. An alienation attitudinal scale was constructed and pre-tested. The scale consisted of 21 Likert-type items intended to measure the affected groups' attitudes toward community leadership, other people in the group, personal estrangement from the community and basic satisfaction with the community. The results indicated that watershed development did not destroy people's perception of their community. However, physical displacement and subsequent community disruption leads to negative attitudes. (Weaver-Wisconsin)

Available from the National Technical Information Service as AD-750 090 $4.85 in paper copy, $1.45 in microfiche. Army Engineer Institute for Water Resources, Alexandria, Virginia, Final Report IWR 72-8, August 1972. 74 p, 4 tab. DACW 31-71-C-0045

Descriptors: *Environmental effects, *Harbors, *Ships, *Economics, *Oil, Offshore platforms, Channels, Navigable waters, Transportation, Ecology, Dredging, Economies of scale, Cost-benefit ratio, Foreign trade, Oil spills, Wetlands, Costs, Decision making, Risks, Design criteria, Benefit-cost analysis
Identifiers: *Deep-draft shipping, *Supercarriers, Dry bulk trade, Refineries, Crude petroleum, Water transshipment, Secondary economic effects.

The findings of an examination of the need for deep water ports and alternatives to accommodate deep-draft ships in U.S. trade are summarized. Benefits and costs of the alternatives are estimated based on consideration of their engineering, environmental and economic characteristics. Petroleum was found to dominate bulk commodities requiring extensive deepwater facilities in the future. Savings in transportation costs indicated that, in economic terms, the cost of developing alternative deepwater terminals would be justified. Offshore facilities located advantageously with respect to areas of high demand and to existing or feasible refinery areas are shown to be economically and environmentally preferable to channel dredging at existing terminals. Determination of optimal locations and capacities of deepwater ports is subject to uncertainities regarding specific requirements for additional refinery capacity. The potential economics of adapting ship sizes to channel condition by increasing capacity without increasing draft is emphasized. Deepwater transshipment ports on the East and Gulf Coasts for dry bulk goods seem economically unfeasible. Action on petroleum ports is urged, but is dependent on the establishment of an institutional mechanism to coordinate effective planning, design and control of their development and operation to eliminate or minimize environmental and ecological damage. THE LITANY OF SCARCITY VERSUS THE CHALLENGE OF ABUNDANCE,
Montana Univ., Missoula. School of Forestry.
R. W. Behan.
Journal of Soil and Water Conservation, Vol 28, No 2, p 50-51, 1973.

Descriptors: *Natural resources, *Food abudance, *Human population, Supply, Demand.

Traditional conceptions of natural resources based upon the belief that resources are a fixed inventory which could never adequately supply the world's ever growing population, that science and technology are agents of environmental degradation and that the standard of living is simply the ratio of fixed resources to growing population are refuted. First, history has shown the Malthus prediction to be the reverse of the reality--that productivity has increased geometrically while

population has only increased arithmetically and in many cases has stabilized. Secondly, technology is the set of value-neutral methods by which man choosen to transform resources to serve his needs. Finally, resources are not fixed inventories, but are a functional concept related to physical substance, utility perceived in the substanceand technology. Thus, resources as functional concept are not inherently limited and in place of a litany of scarcity we should recognize the challenge of abudance. This challenge involves making necessary changes such that abudance may be achieved and when achieved, properly distributed. (Weaver-Wisconsin)

RESOURCES FOR THE FUTURE, ANNUAL REPORT, FOR THE YEAR ENDING SEPTEMBER 30, 1972.
Resources for the Future, Inc., Washington, D.C.

(1972). 123 p.

Descriptors: *Environment, *Long-term planning, Social aspects, Human population, Energy, *Natural resources, *Human resources.
Identifiers: Resource adequacy, Energy crisis, Pollution, Demography, Resource availability, Energy consumption.

In addition to the year's accomplishments and the financial status of Resources for the Future, Inc, an essay by Joseph L. Fisher and two special articles are presented. The essay examines the dichotomy of interests held by environmentalists and those concerned with poverty. The issues are, in fact, interrelated and present common areas for amelioration. The first special article is based on recent RFF studies concerning energy and voices the need for a long-range, comprehensive set of national energy policies in order to divert a possibly impending energy crisis. The question of the relative importance of population growth as compared with economic growth, various forms of technology, and patterns of comsumption and their specific implications for pollution and resource availability are considered. Results indicate that population growth will have significant effects on resource adequacy, environmental quality and consequently, maintenance of the present way of life. Review of the year's work underscored the critical importance of energy consumption and its relation to environmental quality and a wide range of social and economic problems which can only hope to be solved with new methods of policy formulation. DECISION-MAKING IN WATER RESOURCE ALLOCATION,
Oregon State Univ., Corvallis.
C. Brown, J. G. Monks, and J. R. Park.
D. C. Heath and Co., Lexington, Massachusetts, 1973, 111 p. Price $10.00. OWRR B-016-ORE (3).

Descriptors: *Decision making, *Watershed management, Social aspects, Political aspects, Economics, Benefits, *Oregon, *Water allocation (Policy).
Identifiers: Junction City (Ore), Willamette Valley (Ore).

The Junction City project, or more correctly the Amazon Flat Creek Watershed development, was chosen, because it contained all levels of government participation and involved a degree of democratic input into the decision by the general populace. A local agency of government was created to administer and to manage the project. It was necessary to submit a tax base to the voters of the area, and therefore an election was held. This complete process from the local elections to gain local approval through the administrative processes of a bureaucratic system into the political system of the Congress provided an excellent vehicle for the study of decision-making in a compact situation. Very few persons actually participated in the decision process even though the democratic process provided them the legal right to do so. The information flow by those in authority and control did not permit appropriate development of opposition until it essentially became too late for such opposition to be effective. The legal channels of communication are inadequate even when they are supplemented by news stories and public hearings. Residents within the water control district perceive that a specific category of people is receiving the most benefit from the project. Understanding the nature of a public good and identifying advocates were found to be fruitful approaches to this study. The Junction City project was initiated as a flood control and drainage project, but when the concept of irrigation was introduced, some people began to look at the potential gain resulting from irritation more than at the potential loss resulting from floods and standing ground water. The local administrative unit (that is, the water control district) is composed of residents who act as directors but do not necessarily see themselves as government officials. The name of the local administrative unit was misleading to many residents.

A SYSTEMS APPROACH TO ASSESSMENT OF RURAL WATER SUPPLY PROGRAM EFFECTIVENESS,
Asian Inst. of Tech., Bangkok (Thailand). Dept. of Environmental Engineering.
R. J. Frankel.
In: Systems Approaches to Developing Countries, Proceedings of Symposium, sponsored by International Federation of Automatic Control and the International Federation of Operational Research Societies, Algiers, Algeria, May 28-31, 1973, p 241-246, 1973. 2 fig, 3 tab.

Descriptors: *Rural areas, *Water supply, *Evaluation, *Systems analysis, Methodology, Constraints, Resource allocation, Economics, Social aspects, Data collections.
Identifiers: *Effectiveness, *Developing countries, *Thailand, Scare resources, Information, Impact evaluation.

Methodology was developed to evaluate the effectiveness of Thailand's effort in providing potable water to rural communities and to demonstrate the improvements in impact evaluation made possible through application of systems analysis. Just as feasibility studies are necessary to evaluate the technical and economic acceptability of proposed projects, so are impact studies necessary to assess the economic and social effects of projects already undertaken. In Thailand, an impact evaluation was undertaken to analyze the effectiveness of the National Potable Water Project and to provide feedback to the government for improving the administrative, technical and operational aspects of the program. The methodology developed measured the social, economic and public health implications of the water projects towards achieving rural community development. The evaluation addressed the broad issues of whether the water systems have: (1) had a positive effect on community attitudes towards the local and central governments; (2) fostered economic growth; and (3) had a significant positive effect on water use habits and on the overall level of community health. Data are being collected from some 165 village projects throughout northeast Thailand. (Bell-Cornell)

STUDY OF THE CINCINNATI RIVERFRONT - PART I: REGIONAL ASPECTS.
Cincinnati Planning Commission, Ohio.

October, 1969. 16 p, 2 fig, 5 tab, 16 append.

Descriptors: *Regional development, *Recreation demand, Rivers, Land use, Flood plains, Projections, *Ohio River.
Identifiers: *Riverfronts, *Regional economy, *Land use suitability, Waterborne commerce, *Cincinnati.

The Cincinnati regional riverfront is defined as a 45 mile reach of the Ohio River from Lawrenceburg, Indiana to New Richmond, Ohio. The study focuses on the economy of the area, where the population is expected to increase by 20% between 1960 and 1980; on waterborne commerce, with changing patterns in shipping reflected in fewer coal-coke terminals and more terminals devoted to oil-gasoline products, and chemicals; on industrial expansion devoted chiefly to power plants, iron and steel manufacture, atomic energy installations and gas and electric utilities; on land uses in riverfront area; and on the rapidly increasing demands for recreation. Much of the data presented is based on U. S. Army Corps of Engineers reports and previous Planning Commission studies. A key feature of the study is a land use suitability analysis in which various areas of the riverfront region are ranked on the basis of accessibility, flood plain levels, and relationships between land uses. Some basic conclusions are that the region will grow economically at a nominal rate until 1980, that there is a large amount of vacant land available but much of it is not suitable because of lack of access or potential flooding, and that recreation demands are becoming a significance force in the development of the region with needs for future harbor and launching facilities for pleasure craft becoming increasingly evident. EXTERNALITIES, FACTOR PROPORTIONS AND THE LEVEL OF EXPLOITATION OF FREE ACCESS RESOURCES,
London School of Economics and Political Science (England).
J. R. Gould.
Economica, Vol 39, No 156, p 383-402, 1972. 8 fig, 17 ref.

Descriptors: *Economic efficiency, *Resource allocation, Model studies, *Theoretical analysis, Industries, Welfare (Economics).
Identifiers: *Free-access resources, *Externalities, Factor proportions, Resource utilization.

The doctrine that free-access resources are over-exploited finds its theoretical foundation in the work of Pigou and Knight during the 1920's. Knight's analysis of the single variable factor is discussed and further elaborated in order to render the model logically consistent and easy to manipulate as well as to confirm Knight's doctrine that free-access resources are over-exploited. Next, the model is extended to include two variable factors making it necessary to consider the problem of efficient factor proportions. As a result of inefficient factor proportions the over-exploitation theorem is invalidated. Thus, free-access resources may be over- or under-exploited, and accordingly, increasing-cost industries may be over- or under-expanded. The case of increasing returns to variable factors, as analysed by Worcester, is compared with Knight's model. Worcester's assumption of indivisibility of the resource leads to a straightforward prescription of subsidy which does not follow from the assumption of divisibility as in the case of Knight's model. WATER QUALITY AND CONSUMER COSTS.
Orange County Water District, Santa Ana, Calif.

May, 1972. 73 p, 13 fig, 17 tab, 24 ref.

Descriptors: *Water quality, *Water values, *Water utilization, *Data collections, Public benefits, Water users, California, Impaired water use, Potable water, Water distribution (Applied), Water supply, Water softening.
Identifiers: *Orange County (California).

Domestic water users were surveyed by the Orange County Water District and nine water purveying agencies in Orange County to determine the relationships between water quality and related consumer costs. Water quality varied from poor quality water from the Colorado River to high quality ground water. House values included in the survey ranged from below $20,000 to above $50,000. The survey was performed by personal interviews, with families picked from the telephone directory in 40 sampling areas. A total of 1,193 interviews were conducted in 16 cities. Questions were asked relative to: (1) the use of bottled water, (2) replacement of water heaters, (3) use of water softeners, (4) replacement of water piping, (5) occurrence of water damage in homes, (6) satisfaction with present water characteristics, and (7) willingness to pay for better water quality. These questions, and others, were correlated to water quality. Colorado River water, with a total dissolved solid (TDS) concentration of about 746 mg/l, imposes a cost of from $10 to $17 per household per month over expected State Water Project water which should have a TDS of 199 mg/l. FUTURE MUNICIPAL AND INDUSTRIAL WATER REQUIREMENTS IN THE QU'APPELLE RIVER BASIN.
Saskatchewan Water Resources Commission, Regina. Investigation and Planning Branch.

Qu'Appelle Basin Study, Item 230, April, 1972. 68 p, 1 fig, 53 tab, append.

Descriptors: *Water supply, *Water requirements, Withdrawal, Projections, Consumptive use, Municipal water, Industrial water, *Canada.
Identifiers: *Qu'Appelle River Basin, Regina, Moose Jaw, Melville, Saskatchewan.

Future water withdrawals in the Qu'Appelle River basin are expected to decrease significantly by the year 2000 because of the expected phasing out of the Regina power plant after 1985. Municipal water requirements are expected to rise during this period and account for 88.5% of the basin's withdrawals by 2000. Three cities in the basin, Regina, Moose Jaw, and Melville, will account for about 90% of the municipal requirements. Detailed water requirement data for these three cities and twenty-three towns, which are expected to grow, are presented in numerous tables. Water requirements are estimated for industries having their own water supplies. Municipal water supply requirements are estimated on the basis of population projections and an assumed increase of one gallon per capita per day for each year from 1970 to 2000. AMARILLO, TEXAS: REPORT ON WATER DISTRIBUTION SYSTEM, 1967.
Freese, Nichols and Endress, Fort Worth, Tex.

January, 1968. 36 p, 6 fig, 4 plates, 13 tab, 3 append.

Descriptors: *Water distribution, *Distribution systems, Water requirements, Design criteria, Planning, Water supply, *Texas.
Identifiers: Capital improvements, Amarillo (Tex), Canadian River (Tex).

Specific water distribution requirements can be predicted with confidence for about five year periods. Thus, this engineering-oriented study is an extension or re-evaluation of a study conducted in 1962. The study includes an analysis of water demands and peak water use rates, a description of the existing distribution system, a presentation of engineering design criteria, an analysis of the capability of the existing system to meet future requirements, and a table of specific improvements for the five year period up to 1972. The report focuses on a detailed improvement program but it also serves as a general guide for water distribution planning to the year 1990. Among the long-range guidance issues discussed are the use of the Canadian River for a new source of water, the eventual use of groundwater, and the need for one or two new pressure zones as the metropolitan area expands. (Elfers-North Carolina)
W73-14243

WATER USE, CONSUMPTION, AND OUTLOOK IN THE U.S. IN 1970,
Geological Survey, Washington, D.C. Water Resources Div.
C. R. Murray.
Journal of the American Water Works Association, Vol 65, No 5, p 302-308, May 1973. 7 fig, 5 tab, 11 ref.

Descriptors: *Water utilization, *Water users, *Water consumption (Except consumptive use), *United States, Annual, Water supply, Water demand, Domestic water, Industrial water, Municipal water, Stock water, Irrigation, Surface waters, Groundwater, Water reuse, Water resources, Projections.

Every 5 years the U.S. Geological Survey does a study of water use in the United States. In this summary of the report for 1970, comparisons and estimates are made, and every major type of water use is investigated. Estimates of water withdrawals and water consumption in the US in 1970 include about 370,000 mgd or 1,800 gal per capita per day for uses other than the generation of hydroelectric power. About 87,000 mgd of the fresh water withdrawn was consumed; this amounted to about 420 gal per capita per day. About 2,800,000 mgd was withdrawn for hydroelectric power generation; this, like other withdrawal figures, is a cumulative figure because it includes water withdrawn from and returned to streams several times along their courses. Water used for hydroelectric-power generation is equivalent to 2-1/3 times the total runoff in the conterminous US. (See also W72-13829) (Knapp-USGS)
W73-14355

A COMPARISON OF URBAN WATER USE IN AUSTRALIA AND THE U.S.,
Swinburne Coll. of Tech., Hawthorn (Australia).
C. R. Weeks, and T. A. McMahon.
Journal of the American Water Works Association, Vol 65, No 4, p 232-237, April 1973. 2 fig, 3 tab, 6 photo, 26 ref.

Descriptors: *Water utilization, *Water demand, *Australia, Industrial water, Water measurement, *United States, Statistical methods, Correlation analysis, Cities, Urbanization.
Identifiers: Melbourne (Australia), Victoria (Australia).

A quantitative study to evaluate factors involved in residential and industrial water use in Australia was conducted. Levels and patterns of water use in Australia and the United States were compared. Data on Australian water use came from the major metropolitan areas, although specific residential water-use data came from three study areas in Victoria. All data on water use in the United States came from published reports. Some conclusions from the comparison were: present per capita water use in Australian cities is approximately 80% of the use in U.S. cities; overall per capita growth rate in water use is higher in Australian cities than in the U.S.; industrial water use in Melbourne per unit of production is generally lower than the corresponding U.S. figures; components of household use are similar in the two countries; household use of water in the Australian study-area is greater in unmetered and free water-supply areas than in metered areas (whereas in U.S. cities there appears to be no significant difference); and peak rates of demand in Victoria appear to be greater than in U.S. cities. Total demand by the year 2000 for Australian cities is estimated to be 150-190 USgped, which compares with the Water Resources Council figure of 170 USgped for the U.S. (Stein-North Carolina)
W73-14483

WATER RESOURCES OF MIDDLE GEORGIA.
Briley, Wild and Associates, Daytona Beach, Fla.

Available from the National Technical Information Service. Prepared for Middle Georgia Area Planning Commission, Macon. March 1972. 260 p, 33 tab, 23 plates, 4 append. MGAPC-71-08. CPA-GA-04-00-0164.

Descriptors: *Planning, *Water quality control, *Flood control, *Non-structural alternatives, Water supply, Storm runoff, Water resources, *Management, *Georgia.
Identifiers: Middle Georgia Area, Dual drainage system, Flood plain management.

A comprehensive and qualitative study of water supply, water quality control, storm drainage, flood control, and flood plain management for a seven county area around Macon, Georgia is presented. It is intended to define general relationships and offer broad alternatives rather than design specific projects. The report has four basic sections: (1) an inventory and analysis of the region's water resources including supply and demand estimates to 1990 when publicly owned water supplies are expected to be called upon to deliver about 50 mgd of water to domestic, industrial, and commercial users; (2) an outline of a water resources management program including principles for the allocation of surface water and groundwater resources and some policies on runoff related to water quality control; (3) a long range storm drainage and flood control plan that uses a dual drainage system concept whereby a man-made system handles small storms, and natural drainage ways are used for large storms; and (4) a flood plain management program including flood plain zoning, flood hazard identification, flood warning, subdivision regulations, and building codes. Non-structural rather than structural measures are emphasized. (Elfers-North Carolina)

FUTURE ALLOCATIONS OF LAND AND WATER: IMPLICATIONS FOR AGRICULTURAL AND WATER POLICIES,
Iowa State Univ., Ames. Center for Agricultural and Rural Development.
H. C. Madsen, E. O. Heady, K. J. Nicol, and S. H. Hargrove.
Journal of Soil and Water Conservation, Vol 28, No 2, p 52-60, 1973. 9 fig, 7 tab., 20 ref.

Descriptors: *Agriculture, *Institutional constraints, *Water demand, *Water allocation (Policy), *Pricing, Linear programming, Forecasting, Economic efficiency, Land development, Resources development, Water utilization, Competing uses, Crops, Livestock, Food abudance, Economics, Water requirements, Irrigation, Forages.
Identifiers: *Optimal food production, Policy recommendations.

A review of agricultural, land use, and water resources development policy clearly indicates a history of conflicting policy goals. If future food and fiber needs are to be met, the correct mix of policies for development and compensation must be established. A linear programming model was used to establish the possible outcomes during the year 2000, given a framework of selected sets of alternative assumptions concerning farm policy, population, water prices, exports, and technological change. The cost of meeting domestic and export demands for food and fiber was minimized subject to land and water resources. Three general results followed from the analysis: (1) Land should not become physically or economically scarce in 2000; (2) given a national objective of economically optimal food production and land and water use, Western drylands should increase; and (3) given this same economic objective, water would be in surplus supply in the West. Thus, water development for agriculture should be minimized and irrigation development halted if public cost for maintaining given national levels of farm prices and income is to be minimized. WATER SUPPLY PLAN (REVISED) FOR COLUMBUS-FRANKLIN COUNTY,
Mid-Ohio Regional Planning Commission, Columbus.
W. B. Habig, H. T. Merwin, R. B. Cooper, and K. A. Cristofani.
December, 1972. 33 p, 5 fig, 4 tab, 5 plates, 1 append. HUD-Ohio-P-307.

Descriptors: *Planning, *Water supply, *Water demand, *Water distribution, Environmental effects, Water sources, Groundwater, Reservoirs, *Ohio.
Identifiers: Columbus (Ohio), Franklin County (Ohio).

Revisions of the water supply plan element of the Adopted 1969 Water-Related Facilities Plan were necessary because of rapid urban growth and changing water demands, new state and federal legislation, and the increasing concern for environmental quality. The report focuses on new water demand projections up to year 2000, an analysis of possible sources of water supply including groundwater, on-stream reservoirs, and upground storage reservoirs, and update water distribution system plans. Recommendations for the future include the use of groundwater for the next increment of water supply, the study of environmental impacts of possible upground reservoirs, the consideration of wastewater recycling possibilities, the determination of the impact of potential large industrial water users, the implementation of an erosion control program to protect siltation of water supply reservoirs, and the formulation of a new long-range distribution system scheme. The basic theme is one of increasing the flexibility for future action. (Elfers-North Carolina)

6E. Water Law and Institutions

PRIVATE SECTOR REACTION TO NORMAL POLITICAL INSTITUTIONAL PROCEDURES AND OUTCOMES WHEN WATER IS AN ISSUE,
Clemson Univ., S.C. Dept. of Political Science.
H. E. Albert, and D. N. Hall.
Available from the National Technical Information Service as PB-223 375, $6.50 in paper copy, $1.45 in microfiche. Water Resources Research Institute, Clemson University, Clemson, S. C. Report No. 37, 1973. 279 p, 9 fig, 12 tab, 5 append. OWRR B-034-SC (6).

Descriptors: *South Carolina, Social aspects, Political aspects, Administration, *Water pollution, Economics, *Environmental effects, Coasts, *Institutions, *Federal government, *State governments.
Identifiers: Beaufort County (S.C.), Hilton Head Island (S. C.), Columbia (S.C.).

Files, public records and interviews were used to reconstruct a conflict which occurred in South Carolina in 1969 and 1970. The purpose was to establish points of contact between government and various parts of the private sector, determine intergovernmental and interagency relationships, discover the methods used by interest groups to obtain governmental support, and pinpoint possible breakdowns of communication between governmental agencies and between government and the private sector. The conflict centered in the coastal area of South Carolina and dealt with the plans of the Badische Anilin und Soda Fabrik (BASF) Corporation to locate a chemical plant at Victoria Bluff. The residents of nearby Hilton Head Island opposed the plant on the basis of probable pollution. Included in the Hilton Head population are numerous retired business and military leaders, who had both the time and skills necessary to mount a major interest group opposition movement. The opposition was both skillful and effective. BASF finally withdrew all plans for locating their plant in Beaufort County. State officials supported the industry and were unprepared for massive and effective opposition to their normal procedures. Much of their reactions, therefore, was uncoordinated and divisive in its effect. The opposition found its major support with the national government and this interjected elements of federalism.

THE PLACE OF LOCAL AUTHORITIES IN THE MANAGEMENT AND DEVELOPMENT OF WATER RESOURCES,
Manchester County Borough (England).
G. C. Ogden.
Effluent and Water Treatment Journal, Vol 11, No 11, p 607-611, November, 1971.

Descriptors: *Institutions, *Administrative agencies, *Governments, Water resources development, Management, Planning, Coordination.
Identifiers: *Water authorities (England).

Governmental organization for water resource planning and management in England is discussed. The Central Advisory Water Committee appointed to deal with this question recognized the need for national and regional coordination of water resource functions but could find no objective basis on which to recommend between central government-oriented regional water authorities and local government-oriented single purpose authorities. Although local authorities have been recently criticized, they have accomplished significant water resource programs and levels of service and are better than regional authorities in that they are more responsive to the social needs of the people, they have closer links to other planning authorities such as for housing, recreation, and health, and they would be more effective in terms of local coordination and implementation, particularly in resolving conflicts publically. In addition, the local authorities could have representatives on regional authorities for coordination at a broader scale and policy formulation. (Elfers-North Carolina)
W73-14230

GULL LAKE-WATER LEVEL STABILIZATION.
Red Deer Regional Planning Commission (Alberta).

October, 1968. 9 p, append.

Descriptors: Management, *Water sports, *Phreatophytes, *Water level fluctuations, Agriculture, Stabilization, Outdoor recreation, Land classification, *Canada.
Identifiers: *Gull Lake (Alberta).

This brief, requesting assistance under Part VIII Agriculture and Rural Development Act, proposes a project to stabilize water levels in Gull Lake by watershed management in the Gull Lake and Upper Lloyd Creek Basin involving improved land use and productivity by means of drainage, phreatophyte control and diversion. Decline in the Gull Lake water level and extension of marshy beach areas are noted, having detrimental effects on current and future recreational use of Gull Lake. Potential project benefits are ennumerated, including those both for agriculture and recreation, with the conclusion that the optimum value should be obtained from all resources within the area considered for action in this scheme. Proposed future investigation is outlined, accompanied by a cost sharing scheme for the project. Appended are maps of soil capability, oil and gas well locations, recreational capability, shoreland capability, and brief summaries of two preceding studies. (Edwards-North Carolina)

IMPLICATIONS OF PLLRC TAX RECOMMENDATIONS FOR FEDERAL HYDRO PROJECTS AND POWER FACILITIES,
Tennessee Valley Authority, Knoxville. Div. of Navigation Development and Regional Studies.
C. M. Stephenson.
Land Economics, Vol 49, No 1, p 67-75, 1973. 1 tab, 13 ref.

Descriptors: *Public lands, *Taxes, *Compensation, *Federal government, Multi-purpose projects, Powerplants, Income, Local governments, State governments, Federal project policy, Tennessee Valley Authority.
Identifiers: *In-lieu-tax payments, Revenue sharing.

The Public Land Law Review Commission (PLLRC) has developed recommendations with respect to the problem of revenue sharing and payments in lieu of taxes on federal property. These are evaluated in connection with six hydro and power projects in which payments to states and counties are currently made. The TVA payment accounted for 82% of all shared revenues and payments in lieu of taxes for all federal hydro and power projects in fiscal 1970. The remainder of the total $19.6 million was accounted for by the Army Corps of Engineers, Bureau of Reclamation, and the Federal Power Commission. The TVA payment increases steadily because it is based on growing power revenues. However, the Bureau of Reclamation and the Corps of Engineers multipurpose hydro projects base such payments neither on federal investment nor on power sales revenues. Federal payments in lieu of taxes as compared to estimated value of Federal property or revenue of multipurpose projects were found to be meager with the exception of the TVA. Given the PLLRC recommendations for a uniform policy

where payments would reflect a public benefits discount of 10-40% of revenue based on private ownership, the major problem is estimating the amount of potential payments to state and local governments. (Weaver-Wisconsin)

ONTARIO'S WATER TAKING PERMIT PROGRAM,
Ontario Ministry of the Environment, Toronto. Water Quantity Management Branch.
R. P. Dennis.
Water Resources Bulletin, Vol 9, No 1, p 41-48, 1973. 5 fig, 6 ref.

Descriptors: *Water allocation (Policy), *Water permits, *Equitable apportionment, Water supply, Legislation, Common law, Surface water, Groundwater, Water utilization, Wells, Preferences (Water rights), *Canada.
Identifiers: *Ontaria.

Permits issued by the Ontario Ministry of the Environment are required for most water takings in Ontario which are in excess of 10,000 gallons per day for purposes other than domestic, farm or fire fighting. The water-taking program provides protection and control beyond that under common law for situations ranging from water-supply interference between individuals to competing demands. Permits do not create water rights and require permittees to ensure that sufficient water is made available for the needs of prior users. The application of the permit program to an interdisciplinary water-management problem is illustrated by the case of the installation of two high-capacity municipal wells in the rural area of Hunsburger Creek basin to provide additional water for Kitchener, Ontario. Specific permit requirements were designed to protect existing well supplies, streamflow, pond levels and fish. An additional case study of potential conflict in uses of the Big Creek basin indicated that tobacco irrigation reduced stream-flow significantly and that detailed water-management plans for years of extreme irrigative demand should be developed. FLOOD INSURANCE: A REPORT ON ASSISTANCE TO FLOOD VICTIMS IN UNINCORPORATED LAKE COUNTY, ILLINOIS.
North Branch Chicago River Flood Control Steering Committee, Ill.

Prepared for Lake County Board. November 1972. 6 p, 2 append.

Descriptors: *Flood plain insurance, Flood plain zoning, Flood plains, Coordination, Flood damage, Flood protection, *Illinois, Land use.
Identifiers: *Land use controls, *Flood plain management, *Federal Flood Insurance Program, *Lake County (Ill).

The North Branch Chicago River Flood Control Steering Committee was created in 1972 to study flood problems in Lake County and help propose flood relief measures. Their findings are presented on the federal Flood Insurance Program in relation to Lake County. The Flood Insurance Program enables property owners in flood prone areas to purchase flood insurance with the premiums subsidized up to 90% by the federal government. However, this program is only available if the local government in question qualifies via meeting certain federal requirements such as (1) preparing information and maps covering existing flood programs, (2) enacting minimum land use controls (e.g. building codes, zoning ordinances) in flood prone areas, (3) assuring that future flood plain management will be carried out, and (4) designating a local coordinator to be responsible for carrying out the federal Program. Lake County can meet the federal requirements. The creation of a Comprehensive Flood Programs Coordinating Committee is recommended. (Elfers-North Carolina)

FLOOD HAZARD STUDY.
Chatham County-Savannah Metropolitan Planning Commission, Savannah, Ga.

December 1971. 38 p, 6 fig, 1 tab, 1 append.

Descriptors: *Flood plain zoning, *Flood plain insurance, *Flood control, Planning, Non-structural alternatives, Drainage, *Georgia, Land use, *Regulation.
Identifiers: *Savannah (Chatham County).

The Chatham County-Savannah area is characterized by low coastal lands with many canals, rivers and waterways. Much of the area is vulnerable to flooding by extensive rainfall, tidal flooding, or a combination of both. Flooding incidents in 1964 and 1970 highlighted the fact that development has been allowed to take place in areas where physical protection from flooding is poor or entirely lacking. The objective of this study is to present regulations of land use within the flood damage prone zones that will aid in minimizing flood damage, while at the same time insuring the continuance of Federal Flood Insurance for Chatham County. Consequently, the recommendations presented adhere closely to federal guidelines. Primary preventive measure suggested is a Flood Plain District Ordinance, the content of which is explicitly stated. Other preventive measures, such as subdivision regulations, building codes, and other health regulations, are similarly stated in totum; while warning signs, development policies, open spaces and tax adjustments are only generally recommended as needing implementation. As part of a two-pronged approach to flood damage control, needed corrective measures as well as preventive measures are cited. Primarily, channel improvements, watershed treatment, water reservoirs, levees and walls are recommended. (Hoffman-North Carolina)

DES PLAINES RIVER VALLEY: GOALS, POLICIES, AND RECOMMENDATIONS.
Des Plaines River Valley Comprehensive Plan Steering Committee, Ill.

Prepared for Lake County Board of Supervisors, (1971). 4 p.

Descriptors: *Flood plains, *Planning, *Recreation, Water quality, Coordination, Small watersheds, Flood control, Urbanization, *Illinois.
Identifiers: *Flood plain management, Water resource policies, Lake County (Ill), Forest preserves, *Des Plaines River (Ill).

In July, 1970, the Des Plaines River Valley Comprehensive Plan Steering Committee was created by the Lake County Board of Supervisors to develop an overall plan for the river valley and to help coordinate policy formulation and plan implementation. The Des Plaines River which flows 35 miles through Lake County has a history of flooding, as its channel capacity is quite limited, and has recently been deteriorating in water quality. Goals and policies are being formulated in three broad areas of concern: flooding and water management; sanitation and water resources; and recreation and public relations. Some of these policies include the multiple uses of the Des Plaines River, the implementation of flood plain regulations, the acquisition of flood plain areas, the careful planning of large scale developments to control storm runoff, the adoption of Illinois EPA water quality standards and the development of the entire waterfront areas as part of the Lake County Forest Preserve system. Specific recommendations for action focus on acquiring flood plain areas with priority given to 'sites having geological, ecological or historic value, and sites which are being threatened by urbanization', developing the river as a 'water trail' for canoeing and fishing, controlling erosion and sedimentation by use of regulating weirs and dams on river and tributaries, control of storm water runoff, contour plowing of farm lands, and ground cover plantings, and allowing only low intensity urban development in the valley. TRANSACTIONS OF THE 37TH NORTH AMERICAN WILDLIFE NATURAL RESOURCES CONFERENCE,

Meeting held in Mexico City, Mexico, March 12-15, 1972. Wildlife Management Institute: Washington, D.C., 1972. J. B. Trefethen, editor. 472 p, Illus, Maps. Paper. Pr. $6.50.
Identifiers: Birds, Books, *Conferences, Fishes, Human population, *Natural resources, Sea, Symposium, Transactions, Turtle, *Wildlife.

This book contains contributed papers presented at the conference on various aspects of wildlife conservation and management. Part 1 contains papers international conservation challenges, includes papers on renewable natural resources in Mexico; human population, food demands and wildlife needs; balancing human populations with life support systems; and need for a new North American wildlife policy. Part 2 contains technical sessions on natural resources, coastal and marine resources; new needs and views in resource planning; and water, fish, wildlife and society. Part 3 is composed of the reports of special panels involving the ceremony marking the amendment of the 1936 convention for the protection of migratory birds, and the implementation of the council of environmental quality. Finally, the closing general session includes papers on subjects involving soil erosion, chemical contamination of soil and water and recycling of solid wastes.--Copyright, Biological Abstracts, Inc.

IMPROVEMENT OF HYDROLOGICAL SERVICES IN BOLIVIA,
World Meteorological Organization, La Paz (Bolivia).
L. E. Paredes-Arce, and W. Klohn.
In: Decisions with Inadequate Hydrologic Data; Proceedings of 2nd International Symposium in Hydrology, September 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 40-47, 1973. 1 fig, 8 ref.

Descriptors: *Data collections, *Network design, *Economics, *Cost-benefit analysis, Project planning, Decision making, Gages, Instrumentation, Hydrologic data, Water measurement, Stream gages, Rain gages, Precipitation gages.
Identifiers: *Inadequate hydrologic data, *Bolivia.

The Bolivian Government created a unified hydrological and meteorological service in 1968. Available national and international resources are not sufficient for implementation and operation of a minimum national hydrologic network according to the WMO network density criteria. Therefore, a pragmatic approach is required, following different policies in agreement with regional geographic reality. In the mountainous area, priority will be given to immediate and obvious project needs; these will not be satisfied by single stations in project sites, but by local networks. In the eastern plains of Bolivia, no real network is possible owing to geographic isolation, but reference stations will be installed as far as allowed by accessibility of sites and available facilities. Once installed, continued operation of stations will be emphasized. (See also W73-14550) (Knapp-USGS)

PROCEEDINGS OF THE THIRD ANNUAL CONFERENCE ON REMOTE SENSING IN ARID LANDS.
Arizona Univ., Tucson. Office of Arid Lands Studies.

Arizona University, Tucson, Office of Arid Lands Studies. November 1972. 379 p, 183 fig, 5 tab, 163 ref.

Descriptors: *Remote sensing, *Arid lands, *Land use, *Irrigation practices, *Terrain analysis, Surveys, Photogrammetry, Soil moisture, Soil-water-plant relationships, Natural resources, River basins, Flood forecasting, Wheat, Australia, California, Arizona, Data collections.

Of the 24 papers presented a number are addressed to the use of remote sensing in water-oriented problems: The NOAA/NESS program of remote sensing of soil moisture relates to the development of a satellite sensor to provide soil-moisture evaluation in large river basins in order to improve flood and water-level forecasts. Application of a directional reflectance model to wheat canopies under stress enables one to establish the expected consistency between the biological conditions and the remotely-sensed effect. The use of remote sensing techniques in the arid lands of Australia has been applied to land use potential, range-land studies, and mineral exploration and geology, a prime example of the number of operational applications to studies and inventories of an arid environment. Vegetation-terrain feature relationships in southeast Arizona may be determined on relatively small-scale imagery as a valuable indicator of vegetation distribution in an arid area. Monitoring the effects of a changing resource base in an arid lands area: The west side of the San Joaquin Valley, California, illustrates the use of remote sensing to determine land use changes in this arid region for the years 1957 and 1971, focusing on the nature, location, magnitude, direction, and rate of such changes. Remote sensing of irrigation techniques and crop patterns in the Douglas basin, Arizona, describes 7 test areas, irrigation methods used in each, and the crop type, showing conclusively that remote sensing is an effective method of determining the relationship of tail water runoff to various irrigation practices. THE NOAA/NESS PROGRAM OF REMOTE SENSING OF SOIL MOISTURE,
National Environmental Satellite Service, Washington, D.C.
D. R. Wiesnet.
In: Proceedings of the Third Annual Conference on Remote Sensing in Arid Lands; Tucson, November 1972: Arizona University Office of Arid Land Studies, p 66-72, 1972. 3 fig, 6 ref.

Descriptors: *Remote sensing, *Microwaves, *Soil moisture, Aircraft, Satellites (Artificial), Arid lands, Deserts, Arizona, Radiation, Data collections.
Identifiers: *Microwave radiometry.

Radiation emitted in the microwave band of the electromagnetic spectrum by a wet soil is quite different from that emitted by a dry soil. Considerably less energy is detected from the wet soils, and emissivity also varies with the wavelength. A 13.4 GHz radiometer detects radiation emitted from a depth of 5 cm in dry soil. By using lower frequencies, it is possible to sense radiation that is deeper in the soil. (See also W73-14326) (Knapp-USGS)

BASIC CONSIDERATIONS OF HIGH RESOLUTION SIDE-LOOKING RADAR IMAGERY,
Goodyear Aerospace Corp., Litchfield Park, Ariz. Sensor Applications Engineering.
E. S. Leonardo.
In: Proceedings of the Third Annual Conference on Remote Sensing in Arid Lands; Tucson, November 1972: Arizona University Office of Arid Lands Studies, p 78-103, 1972. 19 fig.

Descriptors: *Remote sensing, *Radar, *Aircraft, *Topographic mapping, Terrain analysis, Data collections, Forests, Geology, Land use.
Identifiers: *Side-looking radar.

High resolution side-looking radar is an active sensor capable of day or night operation and, depending on wavelength, unaffected by weather conditions. The end product is an image that can be interpreted and analyzed by geologists, foresters, cartographers and other earth scientists. High resolution side-looking radars direct a narrow beam of energy at right angles to the flightpath. A pulse of radar energy is transmitted from the radar antenna, and the relative intensity of the reflections is used to produce an image of a narrow strip of terrain. The wavelength of energy used in high resolution radars varies from about 1 cm to 3 cm. (See also W73-14326) (Knapp-USGS)
W73-14332

THE APPLICATION OF RADAR AND INFRARED IMAGERY TO QUANTITATIVE GEOMORPHOLOGICAL PROBLEMS,
Texas Univ., Austin. Bureau of Economic Geology.
P. J. Cannon.
In: Proceedings of the Third Annual Conference on Remote Sensing in Arid Lands; Tucson, November 1972: Arizona University Office of Arid Lands Studies, p 104-123, 1972. 12 fig, 5 ref.

Descriptors: *Remote sensing, *Radar, *Infrared radiation, *Small watersheds, Mapping, Geologic mapping, Terrain analysis, Data collections, Vegetation, Drainage patterns (Geologic).

A detailed quantitative geomorphic investigation of an area can be supported by radar and infrared imagery. The Mill Creek drainage basin in south-central Oklahoma was selected as the area for study because of the availability of the data. The usefulness of radar imagery as a quantitative geomorphic tool depends on the size of the area to be investigated, the relief, and the distribution of vegetation. Infrared imagery can provide geomorphic information comparable in amount and quality to information taken from some photographic and topographic studies. Radar and infrared imagery can be used in conjunction to counteract their shortcomings, providing a new and valuable tool to the quantitative geomorphologic investigations of drainage basins. Regional evaluations of drainage basins can be made with radar imagery, and infrared imagery can provide special data about small component basins and portions of basins. (See also W73-14326) (Knapp-USGS)
W73-14333

APPLICATION OF A DIRECTIONAL REFLECTANCE MODEL TO WHEAT CANOPIES UNDER STRESS,
Michigan State Univ., East Lansing. Dept. of Botany.
G. R. Safir, G. H. Suits, and M. V. Wiese.
In: Proceedings of the Third Annual Conference on Remote Sensing in Arid Lands; Tucson, November 1972: Arizona University Office of Arid Lands Studies, p 124-135, 1972. 6 fig, 8 ref.

Descriptors: *Remote sensing, *Infrared radiation, *Moisture stress, *Wheat, Surveys, Data collections, Mathematical models.

A mathematical model was used to predict the directional reflectance of two wheat canopies under disease stress by wheat spindle streak mosaic virus and of the same two canopies under mild water stress. The model enables the directional reflectance of a given crop canopy to be traced to causative factors which are both geometrical and spectral in nature. Field measurements were made of the spectral reflectance of healthy wheat at two angles of view and at two stages of growth. The measured reflectances, in the spectral range of 0.5 to 1.3 micrometers, agreed well with values predicted by the model, indicating that the major components of a wheat canopy that contribute to its directional reflectance can be identified and analyzed. Using the model, it is possible to provide insights as to which detection techniques are most likely to be successful for the detection of wheat and wheat stresses. (See also W73-14326) (Knapp-USGS)
W73-14334

THE USE OF REMOTE SENSING TECHNIQUES IN THE ARID LANDS OF AUSTRALIA,
California Univ., Santa Barbara. Geography Remote Sensing Unit.
R. R. Thaman, and D. A. Cottrell.
In: Proceedings of the Third Annual Conference on Remote Sensing in Arid Lands; Tucson, November 1972: Arizona University Office of Arid Lands Studies, p 136-151, 1972. 85 ref.

Descriptors: *Remote sensing, *Australia, *Aerial photography, Surveys, Land use, Arid lands, Data collections, Hydrology, Vegetation, Exploration, Geologic mapping, Grazing, Ecology.

A study of the use of remote sensing techniques in arid Australia is of considerable interest for a number of reasons: (1) the extensive and isolated nature of the area makes it particularly suitable for surveys using remote techniques; (2) historically, some of the first operational surveys using remote sensing techniques on a regional basis were carried out in this area; (3) considerable research has been conducted by a number of Commonwealth, State and Territorial agencies, private companies, and educational institutions in the use of remote sensing techniques; and (4) the benefits of the use of remote sensing techniques in the arid environment are of considerable economic value to Australia. VEGETATION-TERRAIN FEATURE RELATIONSHIPS IN SOUTHEAST ARIZONA,
Oregon State Univ., Corvallis. Rangeland Resources Program.
D. A. Movat.
In: Proceedings of the Third Annual Conference on Remote Sensing in Arid Lands; Tucson, November 1972: Arizona University Office of Arid Lands Studies, p 152-166, 1972. 8 fig.

Descriptors: *Remote sensing, *Satellites (Artificial), *Terrain analysis, *Vegetation, *Arizona, Geomorphology, Topography, Data collections.
Identifiers: *ERTS.

ERTS-1 imagery is the first stage of a multistage sampling technique, the purpose of which is to determine the types and amounts of vegetation of sourthern Arizona. A comparison is being made of the facility with which landform identifications can be made using low sun angle monoscopic versus high sun angle stereoscopic techniques. There are positive relationships between certain plant species and certain terrain features. Not all species exhibit positive relationships with all terrain feature variables, but such studies have a definite place in plant ecological investigations. The vegetation groups examined appeared to be successfully discriminated by the terrain feature variables. Terrain features mirror factors which directly influence vegetational response and hence distribution. As a result, those environmental features which can be readily and rapidly ascertained on relatively small-scale imagery may prove to be valuable indicators of vegetation distribution. COMPARATIVE EVALUATION OF THERMAL PROFILE DATA OF HEALTHY AND INFESTED ENGLEMANN SPRUCE,
Forest Service (USDA), Phoenix, Ariz. Bureau of Pest Control.
D. D. Lucht, C. H. Denny, E. L. Morrison, Jr., and C. D. Worthman.
In: Proceedings of the Third Annual Conference on Remote Sensing in Arid Lands; Tucson, November 1972: Arizona University Office of Arid Lands Studies, p 168-187, 1972. 9 fig, 4 ref.

Descriptors: *Remote sensing, *Infrared radiation, *Forestry, Insects, Plant pathology, Plant diseases, Forests, Data collections.
Identifiers: *Engelmann Spruce trees, *Spruce beetles.

An infrared scanner was used to collect thermal ground-truth data in coniferous forest areas. This study contributes to the knowledge necessary to

utilize high altitude thermal scanner data for the previsual detection of spruce beetle investigation in the Engelmann Spruce Forest. The temperature profile of infested trees is closer to ambient air temperature than the temperature profile of healthy trees. Infested trees tend to be warmer than healthy trees during hot weather, and colder during extremely cold weather. (See also W73-14326) (Knapp-USGS)
W73-14337

MULTISPECTRAL REMOTE SENSED IMAGE ANALYSIS BY A SPECIAL ELECTRONIC SYSTEM,
Stanford Research Inst., Menlo Park, Calif.
J. A. Eikelman, Jr.
In: Proceedings of the Third Annual Conference on Remote Sensing in Arid Lands; Tucson, November 1972: Arizona University Office of Arid Land Studies, p 188-205, 1972. 8 fig, 1 tab.

Descriptors: *Remote sensing, *Satellites (Artificial), *Data processing, Clouds, Meteorology, Digital computers, Photography, Data collections.
Identifiers: *Time-lapse photography.

A very important technique that has been applied in studying dynamics and development of clouds is the generation of time-lapse sequences of cloud photographs. This has been particularly true with the data from the applied Technology Satellites that, under normal operations, take a picture every 23 minutes during daylight hours. An electronic system was designed for processing and analyzing satellite and other forms of remotely sensed imagery. The system provides a number of processing-analysis features, including a time-lapse sequence production capability. The system also provides many procedures that are not so easily obtainable by photographic or other techniques. These include variable magnification, image planning, selective image recall, frame-to-frame comparison or change detection, data intermixing, spectral (brightness) analysis, areal and distance measurements, and time-lapse sequencing. These features make this electronic system uniquely attractive for real-time operational applications. (See also W73-14326) (Knapp-USGS)
W73-14338

PRODUCTION OF THEMATIC MAPS BY OPTICAL ANALOG PROCESSING OF COLOR TRANSPARENCIES,
Arizona Univ., Tuscon. Optical Sciences Center.
F. V. Richard, and W. Swindell.
In: Processing of the Third Annual Conference on Remote Sensing in Arid Lands; Tucson, November 1972: Arizona University Office of Arid Lands Studies, p 206-215, 1972. 10 fig.

Descriptors: *Remote sensing, *Mapping, *Aerial photography, *Data processing, Data collections, Analog computers.
Identifiers: *Thematic maps.

The analog scanning technique for the production of thematic maps from color transparencies is a relatively simple technique which offers the advantages of rapid processing, good spectral sensitivity and, at the same time, relatively low cost. The processed version of the transparency is recorded line by line as the original is being scanned. This real time feature of the analog approach allows for rapid processing. REMOTE ANALYSIS OF AIRBORNE PARTICLES BY POLARIMETRY,
Arizona Univ., Tucson. Lunar and Planetary Lab.
D. L. Coffeen.
In: Proceedings of the Third Annual Conference on Remote Sensing in Arid Lands, Tucson, November 1972: Arizona University Office of Arid Lands Studies, p 232-243, 1972. 13 fig, 8 ref

Descriptors: *Remote sensing, *Optical properties, *Air pollution, Pollutant identification, Light quality, Aerosols, Particle size, Particle shape, Data collections.
Identifiers: *Polarimetry, Polarization (Light).

Particles suspended in the atmosphere can be studied by passive measurement of scattered sunlight in the useful wavelength range 0.3-3.5 micrometers. For a given wavelength, time, and direction, four independent parameters are necessary and sufficient to characterize a scattered light beam: intensity, percentage linear polarization and its position angle, and percentage circular polarization. The linear polarization is especially useful in deducing intrinsic properties of particles (size, shape, refractive index) and clouds of particles (cloud height, cloud optical thickness). Particulate air pollution can sometimes be detected, and the particles analyzed, by polarization techniques. (See also W73-14326) (Knapp-USGS)
W73-14341

THE APPLICATION OF SPACE IMAGERY TO ANTHROPOLOGY,
New Mexico Archeological Center.
T. R. Lyons, M. Inglis, and R. K. Hitchcock.
In: Proceedings of the Third Annual Conference on Remote Sensing in Arid Lands; Tucson, November 1972: Arizona University Office of Arid Lands Studies, p 244-265, 1972. 14 fig, 10 ref.

Descriptors: *Remote sensing, *Satellites (Artificial), *Archeology, Land use, Cities, Urbanization, Surveys, Mapping, Data collections, Terrain analysis.
Identifiers: *Anthropology.

Remote sensing may be used in anthropology, archeology, and in ethnology. Gemine and Apollo imagery have, since the return of the first film to earth, served the earth sciences and pointed the way to more sophisticated data gathering, data handling, and data analysis systems. These systems are clearly applicable to the study of man and his environment in the analysis of patterns of human modification of the environment, of change in land use and settlement, and of the influence of physiography on man's activities. These analyses combined with the situation logic inherent in the synoptic view of a study area are all benefits now available to the anthropologist. (See also W73-14326) (Knapp-USGS)
W73-14342

THE KIN BINEOLA IRRIGATION STUDY: AN EXPERIMENT IN THE USE OF AERIAL REMOTE SENSING TECHNIQUES IN ARCHAEOLOGY,
New Mexico Archeological Center.
T. R. Lyons, B. G. Pouls, and R. K Hitchcock.
In: Proceedings of the Third Annual Conference on Remote Sensing in Arid Lands; Tucson, November 1972: Arizona University Office of Arid Land Studies, p 266-283, 1972. 6 fig, 19 ref.

Descriptors: *Remote sensing, *Satellites (Artificial), *Archeology, *Irrigation, Land use, Cities, Urbanization, Surveys, Mapping, Data collections, Terrain analysis.
Identifiers: *Anthropology, *Kin Bineola (N Mex).

Analysis of a prehistoric irrigation system at Kin Bineola, near Chaco Canyon, northwestern New Mexico, was undertaken with the use of conventional black-and-white aerial photographs and a Kelsh plotter for microtopographic mapping. The purpose of this experiment was (1) to determine the effectiveness of photogrammetric procedures in identifying cultural features in an arid area of extremely low relief, (2) to aid in the interpretation and analysis of any identifiable features, and (3) to determine the value of these techniques in helping to plan research strategy. A number of cultural features were identified and mapped, including canals, diversion dams, and habitation sites. The photogrammetric procedures employed are explained in some detail, and the application of these techniques to this archeological problem is demonstrated. (See also W73-14326) (Knapp-USGS)

MONITORING THE EFFECTS OF A CHANGING RESOURCE BASE IN AN ARID LANDS AREA: THE WEST SIDE OF THE SAN JOAQUIN VALLEY, CALIFORNIA,
California Univ., Santa Barbara. Geography Remote Sensing Unit.
J. E. Estes, L. W. Senger, and R. R. Thaman.
In: Proceedings of the Third Annual Conference on Remote Sensing in Arid Lands; Tucson, November 1972: Arizona University Office of Arid Land Studies, p 308-317, 1972. 2 fig, 2 tab, 5 ref. NASA Grant 05-003-404.

Descriptors: *Remote sensing, *Aerial photography, *Satellites (Artificial), *Land use, California, Cities, Irrigation, Oil fields, Urbanization, Grazing, Surveys, Data collections.
Identifiers: *ERTS.

The west side of the San Joaquin Valley, an arid region, is undergoing intensive agricultural development and changes in existing extensive land-use patterns. Land-use changes were studied from high altitude photography and ERTS-1 data. An overall regional change pattern shows changes from an oil-producing and grazing area into a cropping region. ERTS-1 data, acquired over shorter intervals of time, should provide more information on: nature of change; location of change; magnitude of change; direction of change; and rate of change. GEOGRAPHIC INVESTIGATIONS ASSOCIATED WITH THE EROS PROGRAM OF THE DEPARTMENT OF THE INTERIOR,
Geological Survey, Washington, D.C. Geographic Applications Program.
J. L. Place.
In: Proceedings of the Third Annual Conference on Remote Sensing in Arid Lands; Tucson, November 1972: Arizona University Office of Arid Lands Studies, p 318-327, 1972. 5 fig.

Descriptors: *Remote sensing, *Satellites (Artificial), *Land use, Cities, Urbanization, Data collections.
Identifiers: *ERTS, *U.S. Geological Survey.

The Geographic Applications Program of the USGS is evaluating the utility of satellite images, supplemented by high altitude aerial photographs, for studying the changing patterns of man's activities on the earth's surface. This would include such things as land use, population changes, or air and water pollution. Urban mapping is being done at a scale of 1:100,000. Among the 26 cities studied are Phoenix and Tucson. In all approaches to land use monitoring, a computerized information system is being developed to relate land use to a

variety of environmental or socioeconomic factors. A land use classification system is applicable in all 50 states, based upon primary use of high-altitude aerial photography or satellite imagery as major sources of information. (See also W73-14326) (Knapp-USGS)

REMOTE SENSING OF IRRIGATION TECHNIQUES AND CROP PATTERNS IN THE DOUGLAS BASIN, ARIZONA,
J. Altenstadter, and K. Foster.
In: Proceedings of the Third Annual Conference on Remote Sensing in Arid Lands; Tucson, November 1972: Arizona University Office of Arid Lands Studies, p 374-379, 1972. 1 tab.

Descriptors: *Remote sensing, *Land use, *Crops, Irrigation, Return flow, Farms, Vegetation, *Arizona.
Identifiers: *Douglas basin (Ariz).

A joint study between the Office of Arid Lands Studies, University of Arizona, the Cochise County Planning Department, and the Whitewater Draw Natural Resource Conservation District investigation had three objectives: (1) to determine remote sensing responses of various irrigation techniques in the Douglas Basin that potentially contribute to the tail-water runoff problem; (2) attempt to discriminate four major crop types; and (3) determine the amount of land that has been set aside as fallow, idle, or retired from agricultural production. A multistage sensing design consists of (1) ground truth; (2) medium altitude (10,000 ft) thermal imagery and color infrared photography; and (3) ERTS-1 satellite imagery. Seven target areas were chosen in the area as a basis from which detailed runoff monitoring and crop type discrimination could be expanded to other areas. Fallow or idle fields could be delineated best, with orchards next. Alfalfa was correctly discriminated 72% of the time. Cotton and small grain proved the most difficult to discriminate using the color infrared photography. (See also W73-14326) (Knapp-USGS)

DYNAMICS OF SUSPENDED SEDIMENT PLUMES IN LAKE ONTARIO,
Geological Survey, Arlington, Va.
E. J. Pluhowski.
Available from NTIS, Springfield, Va 22151 as E-73-10316 Price $3.00 printed copy; $1.45 microfiche. Contract report for Goddard Space Flight Center, January 1, 1973. 6 p.

Descriptors: *Remote sensing, *Satellites (Artificial), *Turbidity, *Lake Ontario, Suspended load, Data collections, Surveys, Mapping, Path of pollutants.
Identifiers: *ERTS, Welland Canal, Niagara River, Oswego River.

The suspended sediment plumes generated by the Welland Canal and the Genesee River are identifiable in most band 5 frames received from ERTS-1. In descending order of value for plume detection in Lake Ontario are bands 4, 6, and 7. Little or no information content relative to plume detection is available in band 7. The Oswego River plume was not visible during low flow periods; however, it was identifiable immediately following storms. Increased suspended sediment loading emanating from storm runoff increases turbidity levels to the point where the plume becomes visible in the ERTS imagery. Despite the fact that it is detectable from high-altitude (60,000 ft) photography, the Niagara River plume was not visible in any of the ERTS-1 frames. Numerous examples of shoreline erosion were evident in the December 7, 1972, imagery of western Lake Ontario. Near-shore lake circulation patterns are usually apparent whenever turbidity plumes are sensed by the satellite. (Knapp-USGS)
W73-14354

DYNAMICS OF PLAYA LAKES IN THE TEXAS HIGH PLAINS,
Texas Tech Univ., Lubbock. Dept. of Geosciences.
C. C. Reeves, Jr.
Available from NTIS, Springfield, Va 22151 as E73-10455 Price $3.00 printed copy; $1.45 microfiche. NASA contract report for Goddard Space Flight Center, March 31, 1973. 9 p, 3 fig.

Descriptors: *Water balance, *Ecosystems, *Limnology, *Texas, *New Mexico, Playas, Lakes, Lake morphology, Remote sensing, Aerial photography, Satellites (Artificial), Data collections, Computer programs, Data processing, Correlation analysis, Photography, Water level fluctuations.

The objective of this project is to correlate ERTS-1 satellite imagery signatures with the water balance ecosystem and geology-morphology of select lake basins in west Texas. Optical analysis of MSS imagery shows that water fluctuations in large lake basins, such as the Double Lakes site, can be monitored. Also, satellite imagery can be utilized to give a wet census of the number of small lake basins which contain water on any one pass. This becomes advisable, from a time and monetary standpoint, where areas, such as the Southern High Plains, contain tens of thousands of lake basins. Individual storm paths can also be traced. A wet census can also be taken from CCT data, but ground-truth correlation must be conducted in order to determine the number of computer classifications to utilize for differentiation of water from wet muds. STRIP-MINED WATERSHED HYDROLOGIC DATA ACQUISITION STUDY,
Tennessee Univ., Knoxville. Dept. of Civil Engineering.
B. A. Tschantz.
Available from the National Technical Information Service as PB-223 558, $2.75 in paper copy, $1.45 in microfiche. Water Resources Research Center, University of Tennessee, Knoxville, Research Report No. 35, 1973. 17 p, 13 fig, 6 ref. OWRR A-030-TENN (1). 14-31-0001-3843.

Descriptors: *Remote sensing, *Strip mines, *Aerial photography, Hydrologic data, *Tennessee, Mapping, Infrared radiation, Land use, Watersheds (Basins), Data collections.
Identifiers: *Data acquisition.

Remotely-sensed aerial photography of two small strip-mined East Tennessee watersheds was used as a means for obtaining land-use information essential to econometric and hydrologic studies and for reclamation practice surveillance. 1:12,000 scale maps were produced for both watersheds from three color IR photographic flights. Other available high altitude photography and thermal imagery data were used to help map strip-mine disturbed areas. Excellent photographic coverage and quality permitted approximately 5,041 acres of watershed, representing 847 acres of distrubed bench, slope, and slide areas to be mapped for each mission at a cost of less than 10 cents/acre. The study demonstrated the usefulness of using low altitude IR photography for identifying, mapping, and measuring strip-mine disturbance areas.

MEASUREMENT OF FLOOD FLOW AND SUSPENDED SEDIMENTATION BY RADIOISOTOPE METHOD,
Taiwan Power Co., Taipei.
D. S. L. Chu, C. F. Pan, and I. L. Cheng.
Final Report November, 1972. 36 p, 10 fig, 11 tab, 2 appendices. IAEA No. 644/RB.

Descriptors: *Flood flow, *Flow measurement, *Suspended solids, *Instrumentation, On-site tests, Analytic techniques, Sampling, Radioisotopes, Sedimentation, Sediment transport, Flow rates, Flood peak, Flood data, Flood discharge, Current meters.
Identifiers: *Taiwan.

The use of radioisotopes to measure flood flow and suspended sediment was studied in Taiwan. Flood flows were studied by comparison of results of the measurement of flows using tritium, the bromide isotope method, the chromium isotope EDTA method, and by the current-meter method. The use of tritium was found to be an acceptable method for flow measurement, but the low cost of the current meter method makes this method the most preferable. The use of tritium was found to be most effective for a mixing length, in meters, equal to 200 times Q 2/3, where Q is the river flow in cubic meters per second. A dosage of one curie per 20cubic meters per second of flow was found to be best. Suspended solids is an important factor in Taiwan water management, because rainfall is heavy (about 250 cm a year) and erosion occurs easily due to weak geological formations. Various sediment gauges have been tried, but they are difficult to operate under the Taiwan conditions. The radioisotope gauge proved to be of no advantage, although improvements in sensitivity and stability may make it usable. (Poertner)

INTERNATIONAL CONFERENCE ON REMOTE SENSING IN ARID LANDS,
Arizona Regional Ecological Test Site, Tucson
L. K. Lepley
In: Proceedings of the Third Annual Conference on Remote Sensing in Arid Lands; Tucson, November 1972. Arizona University Office of Arid Lands Studies, p 1-11, 1972. 1 fig.

Descriptors: *Remote sensing, *Arizona, *Arid lands, Land use, Satellites (Articifical), Geologic mapping, Exploration, Mapping, Urbanization, Vegetation, Phreatophytes, Data collections, Erosion, Grazing, Oceanography, Farms, Snow cover, Ecology.
Identifiers: *Arizona Regional Ecological Test Site.

The Arizona Regional Ecological Test Site (ARETS) was created in late 1970 by the Department of Interior's EROS program and the University of Arizona at the request of the NASA. The purpose of its formation was to establish a center which would include a remote sensing data library, then facilities and equipment for analysis of the data, and a staff who could probide remote sensing expertise. Equipment available for use includes a video density analyzer to convert photographic density levels into contoured density steps and to automatically measure areas. The multispectral viewer combines black and white photography to produce color or false-color images. (See also W73-14326) (Knapp-USGS)

ORBITAL AND AERIAL (RB-57) PHOTOGRAPHY FOR MAPPING SOILS AND GEOLOGY IN SEMI-ARID WEST TEXAS AND EASTERN NEW MEXICO,
Texas Tech Univ., Lubbock. Dept. of Geosciences.
B. L. Allen.
In: Proceedings of the Third Annual Conference on Remote Sensing in Arid Lands; Tucson, November 1972: Arizona University Office of Arid Lands Studies, p 12-45, 1972. 22 fig, 6 ref.

Descriptors: *Remote sensing, *Satellites (Artificial), *Arid lands, Texas, New Mexico, Geologic mapping, Mapping, Surveys, Palyas, Data collections, Aerial photography.
Identifiers: *ERTS.

Apollo 9 orbital photography and RB-57 overflight photography were used to map soils and geologic features in the west Texas-eastern New Mexico area. The RB-57 overflights were useful for distinguishing areas of brown, gray, red, black, and white soils and revealed several alignments of playa lake basins. Apollo photography was particularly useful for gross geologic relationships such as lineament studies, highly generalized soil mapping, and regional distribution of cultural patterns. Previously undiscerned features on both types of photography could be mapped if the photos were compared to soil surveys and geologic maps of the area. Preliminary examination of ERTS-1 MSS imagery indicates that resolution and definition is adequate for general soils maps and regional geologic studies. Identifiable resolution for high contrast linear objects is on the order of a foot. (See also W73-14326) (Knapp-USGS)
W73-14328

EVALUATION OF ERTS-1 IMAGERY FOR AN INVENTORY OF POST-1890 ACCELERATED EROSION,
Geological Survey, Tucson, Ariz.
R. B. Morrison.
In: Proceedings of the Third Annual Conference on Remote Sensing in Arid Lands; Tucson, November 1972: Arizona University Office of Arid Lands Studies, p 46-65, 1972. 14 fig.

Descriptors: *Remote sensing, *Satellites (Artificial), *Erosion, *Arid lands, Grasslands, Mapping, Surveys, Vegetation, Soil erosion, Alluvial channels, Sedimentation, Data collections.
Identifiers: *ERTS.

ERTS-1 imagery was used to inventory the effects of an episode of accelerated erosion that began in southern Arizona about 80 years ago. Around 1890 the larger streams in this region started actively to downcut their channels, bringing to an end an episode of generally sluggish episode that had lasted for about 4,000 years. The accelerated erosion still continues unabated and poses an ecological-environmental problem of great importance to this region. Causes of the post-1890 erosion still are not fully understood. Four principal causes have been hypothesized: overgrazing, adverse climatic change, reduction of burning of the rangeland, and increase in rodent and jack rabbit population. Overgrazing and climatic change are the two chief factors, and they probably acted together. A fundamental change has taken place in the plant ecology of the whole desert grassland region: grass has steadily declined in abundance and shrubs have increased markedly on the desert plains and foothills (notably mesquite but also burroweed, rabbitbrush, ocotillo, catclaw, and white thorn). ERTS imagery is used to evaluate the present status of post-1890 erosion in the Desert Grassland region, the rates of its increase in representative areas, its causal factors, and the degree of success of past and present ameliorative measures. METALLOGENIC SIGNIFICANCE OF ALASKAN GEOSTRUCTURES SEEN ON NIMBUS AND ERTS IMAGES,
E. H. Lathram.
In: Proceedings of the Third Annual Conference on Remote Sensing in Arid Lands; Tucson, November 1972: Arizona University Office of Arid Lands Studies, p 76, 1972.

Descriptors: *Remote sensing, *Satellites (Artificial), *Structural geology, *Geologic mapping, Exploration, Surveys, Mining, Data collections, *Alaska.
Identifiers: *ERTS.

The northeast- and northwest-trending set of traces of crustal structures shown on Nimbus images also appears on ERTS images of Alaska. Comparison of this set of structures with the distribution of mineral deposits and known major structures yields some interesting relations. In the Canadian Cordillera, the development of mineralized regions seems related to major crustal zones or fractures trending southwestward across the Cordillera from the Precambrian shield. In Alaska, the mineralized region of massive sulfides in Prince William Sound and upper Copper River areas and of porphyry coppers in the Nabesna area forms a broad northeast-trending belt possibly related to the Minto Arch on the shield. The belt of metalliferous deposits in the western Alaska Range follows a comparable northeast trend. Mercury deposits, together with most antimony and tungsten deposits, occupy a northeast-trending belt between the Bristol Bay-Mackenzie Bay linear and extensions of a linear along the lower Yukon River. This belt intersects the northwest-trending Canadian belt of similar deposits in the Fairbanks area. (See also W73-14326) (Knapp-USGS)

A COMPUTER PROGRAM FOR GENERATING SCATTERGRAMS ON THE CALCOMP PLOTTER,
Arizona Univ., Tucson. Dept. of Geography and Area Development.
F. T. Aldrich.
In: Proceedings of the Third Annual Conference on Remote Sensing in Arid Lands; Tucson, November 1972: Arizona University Office of Arid Lands Studies, p 216-231, 1972. 12 fig, 3 ref.

Descriptors: *Data processing, *Computer programs, *Charts, *Statistical methods, Statistics, Correlation analysis, Regression analysis.
Identifiers: *Scattergrams, *Data plotting.

A computer graphics system produces two-dimensional scattergrams on a moderately-sized digital computer and digital increment plotter. Scattergrams produced by this program are of publishable quality. The magnetic tape used to generate the graphs may be saved and played repeatedly to produce multiple copies for research distribution or final copy for reproduction. Accompanying the plotted output is a printed summary of the operations performed. The program also allows overlays of multiple sets of data plotted with different symbols for comparing similar information. (See also W73-14326) (Knapp-USGS)

AN INTERDISCIPLINARY EVALUATION OF ERTS POTENTIAL FOR ARID REGIONS,
Nevada Univ., Reno. Renewable Resources Center.
P. T. Tueller.
In: Proceedings of the Third Annual Conference on Remote Sensing in Arid Lands; Tucson, November 1972: Arizona University Office of Arid Lands Studies, p 284-307, 1972. 1 fig, 1 tab, 2 ref.

Descriptors: *Remote sensing, *Satellites (Artificial), *Arid lands, Deserts, Arizona, Aerial photography, Land use, Urbanization, Mapping, Recreation, Irrigation, Vegetation, Nevada, California, Data collections.
Identifiers: *ERTS.

Remote sensing from aircraft and spacecraft (ERTS-1) offers valuable supplemental source of information for the solution of land-use and environmental problems in arid regions. Much of the arid region is being rapidly populated and growth and development is expected to continue at an accelerating rate. This offers a good opportunity to evaluate the impact of man on the land and water systems. Arid regions possibly offer greater potential for the effective use of this imagery than many other parts of the country. The arid regions are generally cloud, smoke and haze free much of the year; they contain large homogeneous areas which are ideal for imagery calibration. A great variety of landforms are found in the desert and are often closely correlated with vegetation distribution, soil classification units, and land use and management. Data available for this study are NASA high flights (RB57F) in July of both 1970 and 1972. Red, green and blue bands, black and white infrared, color and color infrared multispectral data are available on 70 mm format at an approximate scale of 1:432,000. Color and color infrared photographs are also available. (See also W73-14326) (Knapp-USGS)

AUTOMATED PLOTTING AND UPDATE OF LAND USE MAPS AND RELATED INFORMATION IN SOUTH CENTRAL ARIZONA,
Geological Survey, Washington, D.C. Geographic Applications Program.

J. L. Place, and J. R. Wray.
In: Proceedings of the Third Annual Conference on Remote Sensing in Arid Lands; Tucson, November 1972: Arizona University Office of Arid Land Studies, p 328-343, 1972. 10 fig.

Descriptors: *Remote sensing, *Satellites (Artificial), *Land use, *Mapping, Data processing, Arid lands, Cities, Urbanization, Data collections, Farms, Arizona.
Identifiers: *ERTS, Phoenix (Ariz).

The Geographic Applications Program of the U.S. Geological Survey is participating in investigations in the Arizona Regional Ecological Test Site. This consists of land use mapping and change detection experiments at two different scales. A Calcomp 763 plotter was used to plot a land use map of the entire Phoenix Quadrangle. The urban and builtup areas around Phoenix are shown with different symbols representing cells for residential, commercial, industrial, urban open, transportation, and quarrying. The agricultural land is shown with different symbols representing tree crops and nontree crops. Desert parkland is shown, as is military property. Overlain on this is the black culture plate of the standard topographic quadrangle. In this way, much time is saved in adding place names, boundaries, grids, and information. When data are processed by a computer, the land use and data of information for both the new and old information are retained. In this way, trends can be monitored automatically. An updated map may be plotted automatically. (See also W73-14326) (Knapp-USGS)

PROGRESS ON GEOLOGIC-TERRAIN MAPPING FOR LAND-USE PLANNING IN THE TUCSON AREA,
Geological Survey, Denver, Colo.
R. B. Morrison.
In: Proceedings of the Third Annual Conference on Remote Sensing in Arid Lands; Tucson, November 1972: Arizona University Office of Arid Lands Studies p 344-363, 1972. 6 fig.

Descriptors: *Remote sensing, *Terrain analysis, *Geologic mapping, *Hazards, Planning, Land use, *Arizona, Mapping, Surveys.
Identifiers: *Flood mapping, *Tucson (Ariz).

Land use planning should be founded on an inventory and appraisal of the whole natural environment, with an objective assessment of the various kinds of natural advantages and limitations. Also, different possibilities for land use at given sites should be tested according to systems concepts, so that unfavorable or hazardous situations or adverse environmental changes can be anticipated and avoided and the most desirable and least detrimental use of land can be promoted. The most fundamental environmental factors, other than climate, are geologic and terrain factors. Ranked in decreasing order of importance, they are: (1) topographic-geomorphic factors; (2) geologic factors; (3) hydrologic factors; and (4) soil factors. In most cases these geologic-terrain factors are more fundamental and relevant to proper land-use planning than social, economic, and political considerations. A large area surrounding Tucson, Arizona, is rapidly undergoing development for residential, commercial, and industrial uses. The development is proceeding without a comprehensive regional plan for potential land uses. To aid in planning, geologic-terrain maps were made for the 1,300 square-mile area in and around Tucson. These maps are to be published at 1:125,000 scale. They are produced mainly by interpretation of ultrahigh altitude color and color-infrared aerial photographs, controlled by available published and unpublished reports and maps and by some additional field observations. WATER RESOURCES OF WISCONSIN--LAKE MICHIGAN BASIN,
Geological Survey, Washington, D.C.
E. L. Skinner, and R. G. Borman.
For sale by USGS, Washington, D.C. 20242 $1.50 per set. Hydrologic Investigations Atlas HA-432, 1973. 4 sheets, 42 ref.

Descriptors: *Water resources, *River basins, *Lake Michigan, *Hydrologic data, Streamflow, Runoff, Flow rates, Water yield, Water quality, Chemical analysis, Hydrologic cycle, Water demand, Water balance, Hydrologic budget, Water utilization, Precipitation (Atmospheric), Land use, Topography, Environmental effects, Maps, Irrigation, Planning.

This 4-sheet atlas describes the water resources of the Lake Michigan basin as an aid to water management. Described are the distribution, characteristics, and physical environment of the resource, as well as the hydrologic budget, water quality, water problems, and water use. The information will be used to select sites for systematically monitoring the effects of a changing environment on the hydrology of the area. Data were gathered from various agencies and collected during field investigations. The Lake Michigan basin is a 3,600 square mile drainage area that lies along eastern Wisconsin and borders the western shore of Lake Michigan. It consists of several subbasins whose main stem streams discharge directly into Lake Michigan and into Green Bay. The study area does not include basins whose main stem streams discharge into Green Bay from the west and south. Included in the Lake Michigan basin are Door, Kewaunee, Manitowoc, Ozaukee, and Sheboygan Counties and parts of Brown, Calumet, Fond du Lac, Kenosha, Milwaukee, Racine, Washington, and Waukesha Counties. (Woodard-USGS)

STATUS OF FLOOD-PLAIN MAPPING, GREATER PITTSBURGH REGION, PENNSYLVANIA, 1972,
Geological Survey, Carnegie, Pa.
R. M. Beall, and A. C. Lardieri.
Open file report, September 1972. 16 p, 1 map, 3 tab, 10 ref.

Descriptors: *Floods, *Flood plains, *Mapping, *Pennsylvania, Investigations, Programs, Planning, Flood protection, Flood data, Maps.
Identifiers: *Pittsburgh region (Penn).

The purpose is to show the extent of recent flood-mapping activity, the coverage by flood plain information reports in the six county Greater Pittsburgh region, and to provide summary information about the flood problems and flood investigations of urban places within the region. The Greater Pittsburgh regional studies deal chiefly with the six western Pennsylvania counties of Allegheny, Armstrong, Beaver, Butler, Washington and Westmoreland. Old flood studies have not been searched or referenced on the map because patterns and zones of inundation are subject to change. Flood-prone areas may be altered by encroachment from any or all sides, by channel improvement or floodwall or levee construction, or by the natural or enhanced channel processes of scour and fill. The flood-mapping activities shown are those of the U.S. Army Corps of Engineers, U.S. Geological Survey, and U.S. Department of Agriculture Soil and Conservation Service. Flood plain information reports released through 1971 are listed. (Woodard-USGS)
W73-14352

HISTORIC AND JUNE 1972 FLOOD ELEVATIONS, GREATER PITTSBURGH REGION, PENNSYLVANIA,
Geological Survey, Carnegie, Pa.
R. M. Beall.
Open-file report, September 1972. 11 p, 1 fig, 1 map, 2 tab, 11 ref.

Descriptors: *Floods, *Flood stages, *Peak discharge, *Pennsylvania, Historic floods, Correlation analysis, Map, Hydrologic data, Flood data, Flood discharge, Streamflow, Gaging stations.
Identifiers: *Pittsburgh region (Penn).

The flood of June 1972 was a notable one in a large part of the Greater Pittsburgh region. Tropical storm Agnes in late June 1972 had several peculiarities of behavior and effect. A six-county area (consisting of the Pennsylvania Counties of Allegheny, Armstrong, Beaver, Butler, Washington, and Westmoreland) can claim its share of notoriety because of the severe flooding in the eastern tributaries of the Allegheny and lower Youghiogheny Rivers. The combined effect was a flood of notable magnitude along the lower reaches of the Allegheny and Monongahela Rivers and in the Ohio River for some distance downstream from Pittsburgh. Storm runoff from the Beaver River basin and the upper Monongahela was substantial but not unusual. Maps and tables show the extent by which the June flood exceeded or was below flood stage. In places where a flood-stage figure has not been established or is not relevant to the definition of that term, the distance above or below bankfull stage is shown and listed, if available. Record-breaking flood heights were observed at the following mapped and listed sites: Clarion River at St. Petersburg, and Redstone Creek at Waltersburg. New record maximums (not listed) were also observed in the upper Mahoning River basin and in other headwater basins in the eastern half of the region. (Woodard-USGS)

LAB AUTOMATION AT LOW COST,
Digital Equipment Corp., Maynard, Mass. Lab. Data Products Group.
D. Glover.
Research Development, Vol 24, No 5, p 22-25, May 1973. 3 fig.

Descriptors: *Laboratory equipment, *Costs, *Automation, Computers, Instrumentation, Data storage and retrieval, Data transmission, Flexibility.
Identifiers: *Computer design.

This discussion covers those factors that must be considered in choosing a low cost laboratory computer system. Such a system may be either (1) a small system which is expandable to a medium size system or into a satellite interfaced to a large central system, as the lab requirements expand, or (2) a full-blown, time-shared system. This, of course, depends on the need of the laboratory, funding and the resources it commands. Those common elements that exist in the instrumentation in the laboratory should be considered in choosing from the variety of approaches available. The approach obviously depends on the desired end result and the decision as to how it should be attained. Computer output, data storage, and resolution enhancement are also very important considerations. (Holoman-Battelle)

CANAL BANK RETAINING WALL MEANS AND METHOD,
P. R. Jacobs, and M. L. Jacobs.
U. S. Patent No. 3,744,255, 5 p, 7 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 912, No 2, p 454, July 10, 1973.

Descriptors: *Patents, *Canal construction, Engineering structures, *Concrete-lined canals, Ecology, *Canal embankments, Recreation, Natural resources, Cast-in-place structures.

A concrete inclined canal bank retaining wall and method of constructing it are described. A canal is dug with inclined earthern banks. The concrete inclined retaining wall is poured onto the banks immediately after the canal is dug and before the canal becomes filled with water or the banks deteriorate because of rain storms or wave action. Expansion joints at spaced intervals along the length provide for expansion and contraction of the retaining walls upon changes in ambient temperatures. The sloping wall surface may be roughened to provide niches for sheltering marine life. (Sinha-OEIS)

LANCASTER COUNTY PLANNING COMMISSION: STORM DRAINAGE STUDY.
Weston (Roy F.), Inc., West Chester, Pa.

August 1970. 24 p, 10 ref, 3 append.

Descriptors: *Storm drains, *Storm runoff, Runoff, *Design criteria, *Drainage systems, Drainage, Environmental effects, Sewers, Drains, *Pennsylvania.
Identifiers: Storm intensity, *Lancaster County (Penn).

Design criteria are recommended which will provide the basis for the design of adequate storm drainage facilities for suburban, urban, industrial, and agricultural areas of Lancaster County Pennsylvania, where growth has changed many of its areas from principally rural farm orientation to a commercial-residential nature. An inventory is provided of the existing major storm drainage systems within the county and the scope of a future storm sewer report of a more comprehensive nature is suggested. Included within the recommended design criteria for storm drainage facilities are the basic runoff equations for the determination of the volume of runoff, using the 'Rational Method,' runoff coefficients relative to the various types of surfaces, and storm intensity duration curves for various frequency storms based on data supplied by U. S. Weather Bureau records. Gutter flow and inlet location, and erosion control are discussed. Maps relating to the major and minor sewer systems in the county are included. (Edwards-North Carolina)

LASER DOPPLER VELOCITY MEASUREMENTS OF SWIRLING FLOWS WITH UPSTREAM INFLUENCE,
California Univ., Santa Barbara.
K. L. Orloff, and H. H. Bossel.
Avaialable from NTIS, Springfield, Va 22151 as NASA CR-2284 Price $3.00 printed copy; $1.45 microfiche. National Aeronautics and Space Administration Contractor Report NASA CR-2284, July 1973. 42 p, 12 fig, 3 plate, 24 ref. NGR 05-010-025.

Descriptors: *Rotational flow, *Vortices, *Fluid mechanics, Analytical techniques, Velocity, Anemometers, Instrumentation, Flow measurement, Theoretical analysis, Equations, Reynolds number, Correlation analysis, Streamflow.
Identifiers: *Laser-doppler anemometer.

Swirling flow in a rotating tube is studied by flow visualization at a moderate Reynolds number, and its velocity field is measured by laser-Doppler anemometry. The tube has constant diameter, and approximately uniform initial rigid rotation of the flow is assured by passing the flow through a rotating plug of porous metal before it enters the test section. At moderate swirl values, an object mounted on the tube centerline causes a closed bubble to form upstream of the obstacle, with a clearly defined stagnation point on the axis, and recirculating flow inside the bubble. The bubble length grows upstream as the swirl is increased, until it breaks up into a Taylor column reaching all the way upstream and downstream at swirl values above a certain critical value. A vortex jump (in the sense of Benjamin) occurs downstream of the obstacle except when the Taylor column is present. Using a laser Dopper anemometer, axial and swirl velocity profiles are obtained at several stations upstream and downstream of the bubble, and in and around the bubble. The experimental velocity profiles, the stream surface plots, and the velocity distribution on the axis are compared with the corresponding results of solutions to the equation of inviscid rotating flow. WAVE MEASUREMENTS OFF OXNARD, CALIFORNIA,
Naval Civil Engineering Lab., Port Hueneme, Calif.
W. E. Hoffman.
Available from the National Technical Information Service as AD-451 129, $6.00 in paper copy, $1.45 in microfiche. Report No. NCEL-TN-530, August 1964. 52 p, 33 fig, 6 tab, 5 ref.

Descriptors: *Breakwaters, *Harbors, Jetties, Beaches, *Coastal engineering, *Waves (Water), Equipment, Ocean waves, Engineering structures, *Sediment transport, *California.
Identifiers: Nearshore processes, Sand bypassing, *Littoral sand drift, Beach stabilization, Sand transport, Oxnard (Calif).

A description is presented of a mainly water level (wave) measuring complex in about 18 feet of water behind and in the vicinity of an off-shore breakwater for a small craft harbor. The breakwater serves as a trap for sand which is by-passed periodically around the jetties of a major harbor about one mile downshore (Port Hueneme, California). Instruments and methods are discussed for the complex as progressively improved over a 10 year period beginning in 1953. Types of measurements are presented with typical daily average: Surface water level variation from three stations-height 1.5 feet and period of 11.3 seconds; water temperature 60 degrees F; breaking wave height 2.9 feet and 6.5 period; littoral current velocity-SE set at 60 feet/minute-wind velocity on-shore at 15 knots. The beach and sea surface were recorded on photographs periodically. All data collected was sent to Coastal Engineering Research Center for analysis and reporting. The data are intended to improve the understanding of behavior of waves and beaches behing and in the vicinity of an off-shore breakwater. Effective July 1964, the Los Angeles District of the Corps of Engineers assumed responsibility for the complex. The information presented is considered useful mainly to those planning subject type installation. (Sinha-OEIS)

LABORATORY STUDY OF SEICHING INDUCED ON AN OFFSHORE SHELF,
Naval Civil Engineering Lab., Port Hueneme, Calif.
L. E. Robson, and D. B. Jones.
Available from the National Technical Information Service as AD-653 711, $6.00 in paper copy, $1.45 in microfiche. NCEL Technical Note N-895, February 1967. 46 p, 25 fig, 5 tab, 13 ref, 2 append.

Descriptors: Beaches, *Seiches, *Waves (Water), *Coastal engineering, *California, *Nuclear explosions.
Identifiers: *Mono Lake (Calif), Wave tank experiments, Dispersive wave trains, Long period waves.

An exploratory investigation was made in the laboratory wave tank to determine whether with existing equipment an oscillation (seiche) of the water over a submerged shelf just offshore could be induced by an incident train of shorter waves and if so, whether the run-up from the wave system on the beach would thereby be affected significantly. This study was a phase of current work dealing with the run-up and other shore effects of surface gravity waves from underwater explosions. When the wave-maker was set to generate short waves, a low-amplitude dispersive train preceded the regular (periodoc) train. Weak low-frequency oscillations in the run-up record occurring prior to the arrival of the periodic train were detected in seven of eighteen runs analyzed, the frequencies agreeing with estimates of first-mode shelf-seiche frequencies. A special run-up factor was evaluated for four of seven runs; it indicated maximum run-up in the long-period wave spectrum along of from 35% to 85% of the maximum run-up in the spectrum of the incident dispersive waves. The highest value was associated with the highest incident train. From these results it was concluded that a seiche existed in some of the runs. It is believed that the principal reason why no oscillation was detected in other runs is that the heights of the incident dispersive waves (which could not be increased) were too small. When the wave-maker was set to generate long waves, the initial waves at the shelf were those of the periodic train. (Sinha-OEIS)

REFRACTION OF DISPERSIVE WAVES ON A BEACH,
Naval Civil Engineering Lab., Port Hueneme, Calif.
J. R. Evans, and D. G. True.
Available from the National Technical Information Service as AD-618 876, $3.00, in paper copy, $1.45 in microfiche. NCEL Technical Note N-738, June 1965. 26 p, 15 fig, 2 tab, 2 ref.

Descriptors: *Refraction (Water waves), *Beaches, Coasts, *Coastal structures, *Nuclear explosions, Earthquakes, *Tsunamis, Coastal engineering, *Breakwaters, Piers.
Identifiers: *Dispersive waves, Near shore processes, Refraction patterns, Underwater earthquakes, Water shock, Snell's Law, Green's Law.

This study concerns measurements in the laboratory of refraction patterns of dispersive waves on a veach and the comparison of results with those predicted by theory. The object was to determine the effects of nuclear explosive excited surface water waves, air blast and water shock on piers, breakwater and other waterfront structures. Dispersive waves are also generated by earth movements under water which generate tsunamis. Beaches front many waterfront structures and hence affect wave loading on the structures. It was found that refraction of dispersive type waves on a beach may be predicted by use of Snell's Law, and amplitudes of refracted waves may be predicted by a modified form of Green's Law. EXPERIMENTAL STUDY OF LONGSHORE CURRENTS ON A PLANE BEACH,
C. J. Galvin Jr., and P. S. Eagleson.
Available from the National Technical Information Service as AD-615 790, $3.00 in paper copy, $1.45 in microfiche. Technical Memorandum No. 10, January 1965. 88 p, 38 fig, 12 tab, 35 ref, 1 append.

Descriptors: *Beaches, *Erosion, Deposition (Sediments), Sedimentation, *Sediment transport, *Coasts, *Waves (Water).
Identifiers: *Near shore processes, *Longshore currents, Surf zone, Wave effects.

Measurements were made of the characteristics of breaking waves and the resulting longshore currents for 34 combinations of wave height (up to 0.22 foot), period (0.90 to 1.50 seconds), and breaker angle (up to 32 degrees), along a 20-foot test section of a 30-foot plane, smooth concrete beach with a slope of 0.104. Observation and measurement show that most of the fluid in the surf zone stays there, and that longshore current velocity initially increases downstream from an obstacle. Velocity increases along the beach because the fluid forming the breaking wave has been withdrawn from the surf zone, and thus already has a longshore component of motion, to which is added the longshore component of motion of the breaking wave. A differential equation for this non-uniform flow agrees qualitatively with the measured variation of velocity with breaker angle and with distance from an obstacle. The non-uniformity of the flow was also indicated by the mean water level, which increased, and the breaker position and runup limit, which moved shoreward, downstream from the obstacle, but there is a possibility that these measurements were affected by the experimental apparatus. The energy used to maintain the flow of longshore currents is a small fraction (less than 1/10) of the energy brought to the surf zone by shoaling waves. The mean velocity of uniform longshore currents is approximately given by $V \pm gmT \sin 20b$, an equation which is one form of the conservation of mass in the surf zone. (Sinha-OEIS)

WATER WAVES FROM UNDERWATER EXPLOSIONS IN SHALLOW WATER, PART II: CHARACTERISTICS OF WAVES NEAR THE SHORELINE AND METHOD OF ESTIMATING WAVE FORCES ON A VERTICAL BARRIER,
Naval Civil Engineering Lab., Port Hueneme, Calif.
H. Wang.
Available from the National Technical Information Service as AD-665 799, $6.00 in paper copy, $1.45 in microfiche. Report No. NCEL-TN-945-Pt-2, January 1968. 61 p, 35 fig, 10 ref, 1 append.

Descriptors: Ocean waves, Beaches, Shores, *Sea walls, Seashores, Data processing, *Barriers, *Waves (Water), *Nuclear explosions.
Identifiers: *Near shore processes, Incident wave shape, Water particle velocity, *Wave profiles, Surface gravity waves, Beach slope.

The characteristics of dispersive water waves--wave celerity, water particle velocity, and wave deformation--were studied in the laboratory in a region adjacent to the shoreline on a beach which has a 1:14 slope. The waves were generated by immersing a plunger at a distance from the shoreline in water of constant depth. A numerical scheme for the calculation of mean water particle velocity in the horizontal direction was developed according to the principle of continuity. This scheme is highly stable and is suitable for small computer facilities such as the IBM 1620. Methods for the estimation of wave forces and pressures on a vertical barrier, mounted as a seawall, were developed. The methods are based on momentum consideration and require knowledge of the water particle velocity in the horizontal direction and the shape of the incident wave. (Sinha-OEIS)

MODELLING TECHNIQUES FOR A SYSTEM ENGINEERING APPROACH OF THE PROBLEMS OF WATER USES FOR AGRICULTURAL PURPOSES,
Padua Univ. (Italy). Instituto di Elettrotecnica e di Elettronica.
A. Lepschy, S. Milo, and D. Torriano.
In: Systems Approaches to Developing Countries, Proceedings of Symposium, sponsored by International Federation of Automatic Control and the International Federation of Operational Research Societies, Algiers, Algeria, May 28-31, 1973, p 491-497, 1973. 6 fig.

Descriptors: *Hydraulic engineering, *Hydraulic systems, *Mathematical models, *Systems analysis, *Simulation analysis, *Design, Agriculture, Water users, Resource allocation, Canals, Networks, Reclamation, Irrigation, Computers, *Irrigation.
Identifiers: State variable approach, Hydraulic plants, Developing countries.

The problems of reclamation and irrigation plants are becoming increasingly important for a better exploitation of agricultural resources and for the improvement of land use. The main results hitherto obtained in the field of hydraulic system simulation are summarized and a possible exploitation of these methods for design purposes is presented. Techniques are suggested to derive mathematical models for studying the most important problems which arise in the design and control of hydraulic plants. A main characteristic of the models considered is the adoption of a state variable approach, and the use of those techniques which refer to system theory and are suitable for the

computer approach to problems of system engineering concerning land use. A state variable model of canal networks for agricultural purposes is presented; this model may be set up by combining elementary block diagrams corresponding to the main kinds of subsystem into which the whole system may be subdivided. A model for a hydraulic hoisting reclamation plant is discussed and the approach to the solution of a design problem is presented based on the comparison of the values of some performance indexes corresponding to different control policies. PRESSURE TRANSIENT ANALYSIS OF NATURALLY FRACTURED RESERVOIRS WITH UNIFORM FRACTURE DISTRIBUTION,
Atlantic Richfield Co., Dallas, Tex.
H. Kazemi.
Society of Petroleum Engineers Journal, Vol 9, No 4, p 451-462, December, 1969. 13 fig, 4 tab, 15 ref.

Descriptors: *Fractures (Geologic), *Oil reservoirs, *Porosity, *Porous media, Pressure, Drawdown, Fluid flow, Heterogeneity, Homogeneity, Unsteady flow, Mathematical models, Storage capacity.
Identifiers: *Pressure transient analysis, Boundary effects, Skin effect, Warren-Root equations.

A number of papers are reviewed on the analysis of flow and buildup tests for obtaining reservoir characteristics. An ideal theoretical model of a naturally fractured reservoir with a uniform fracture distribution is presented. This model consists of a finite circular reservoir with a centrally located well and two distinct porous regions, referred to as matrix and fracture. The matrix has high storage but low flow capacity. The fracture has low storage, but high flow capacity. The flow in the entire reservoir is unsteady state. In general, the analysis of a naturally fractured reservoir from pressure transient data relies considerably on the degree and type of heterogeneity of the system. Testing procedures and facilities are sometimes as important. Nevertheless, under favorable conditions, calculations should be possible of in-situ characteristics of the matix-fracture system, such as pore-volume ratio, overall capacity of the formation, total storage capacity of the porous matrix, and some measure of matrix permeability. The behavior of a fractured reservoir approaches that of an equivalent system of homogeneous reservoir at large times. (Gray-NWWA)

EFFECT OF ANISOTROPY AND STRATIFICATION ON PRESSURE TRANSIENT ANALYSIS OF WELLS WITH RESTRICTED FLOW ENTRY,
Atlantic Richfield Co., Dallas, Tex.
H. Kazemi, and M. S. Seth.
Journal of Petroleum Technology, Vol. 21, No. 5, p 639-646, May, 1969. 9 fig, 15 ref.

Descriptors: *Flow resistance, *Anisotropy, *Stratification, *Pressure, Drawdown, Productivity, Flow, Subsurface flow, Mathematical models.
Identifiers: *Drill-stem tests, *Boundary conditions, Buildup, Interference test, Pressure transient analysis.

A numerical model was devised with a more realistic boundary condition than in earlier studies. A chart is provided to include the effect of anisotropy in production impairment estimations. The results of the conventional interference test analysis, which are based on total penetration, can be applied to reservoirs, with restricted flow entry Equations were derived to calculate the proper duration of flow and buildup tests. These equations can be used in analyzing short-term tests, such as drill-stem tests, and as a preliminary measure in tests designed to indicate permeability stratification. (Gray-NWWA)

FACTORS THAT AFFECT WELL LIFE,
Universal Oil Products, St. Paul, Minn. Johnson Div.
R. L. Schreurs.
Irrigation Age, Vol 4, No 9, p 12, 14-15, 18, April, 1970. 2 fig.

Descriptors: Wells, *Water wells, Iron bacteria, Chemical reactions, Bactericides, Groundwater, *Scaling, Corrosion, *Aquifer characteristics.
Identifiers: *Well development, *Acidizing, Well efficiency, Pumping tests, Incrustation.

The expected service life of a well might be judged in somewhat the same way as human life expectancy. This analogy between wells and humans can be carried further in that both are prevented from producing at the highest level of their capabilities by causes completely foreign to themselves. There is nothing that can be done to the well itself to overcome such difficulties, but it is important to be able to recognize these outside causes so as not to waste time and money trying to solve them by treating the well. There are, however, a number of things which can cause the well to perform below its capability. These are a result of damage to the well itself and can be corrected by proper treatment. The most important of these is the clogging (incrustation) of the well screen or slotted portion of the well casing. An in-depth discussion of the common forms of incrustation and appropriate treatments is presented and a hypothetical study is graphically depicted. Stressed is the point that an incrusted well is inefficient and costly. To insure long, trouble-free life, a well should be inspected regularly, precise records kept and proper treatment applied at the appropriate time. (Cambell-NWWA)

SOME EFFECTS OF SIZE DISTRIBUTION ON PARTICLE BRIDGING IN LOST CIRCULATION AND FILTRATION TESTS,
Texas Univ., Austin.
C. Gatlin, and C. E. Nemir.
Journal of Petroleum Technology, Vol 13, No 6, p 575-578, June, 1961. 4 fig, 3 tab, 19 ref.

Descriptors: *Particle size, *Particle gradation, *Filtration, *Well filters, Gravels, *Granules, Bentonite, *Drilling fluids.
Identifiers: *Particle bridging, Maximum packing density, Filter cake permeability, Spurt loss, Lost circulation, Nut shells, Furnas method.

Particle size distribution such as to provide maximum density of beds of packed solids (according to the method of Furnas) was investigated in a laboratory study of loss of mud circulation and filter cake formation. Tests on the bridging and sealing of a wedge-shaped slot showed that a maximum density distribution of nut shell particles was more effective than a randomly selected sample of the commercial product. Samples of fractionated bentonite were used in mud filtration tests on paper and on sandstone cores. Size range of the bentonite particles was 0.05 to 40 microns. The spurt loss at the beginning of filtration was least with the maximum density distribution but the rate of filtration following the initial spurt was lowest in the mud with a preponderance of the small particles (which could not be considered as inert). The suggestion is offered that the Furnas theory may have application in the selection of aggregate for gravel packs and other filtration conditions. (Gray-NWWA)

THE HORIZONTAL WELL AS A NEW METHOD OF RANGE WATER DEVELOPMENT,
Agricultural Research Service, Tucson, Ariz.
J. T. Welchert, and B. N. Freeman.
Progressive Agriculture in Arizona, Vol 21, No 6, p 8-11, November-December, 1969. 6 fig, 1 tab.

Descriptors: *Wells, *Water wells, Aquifer characteristics, *Groundwater, *Water sources, *Aquifers, Seepage, Springs.
Identifiers: *Horizontal wells, Trapped water, Controlled seepage area, Cased springs.

Providing stock water where desired at a price that is reasonable has always been a problem for the stockman. Conventional systems such as dirt tanks, catchment basins, vertical wells and springs have been satisfactory in some cases but each has a characteristic limitation. With the introduction of horizontal wells the potential is to tap relatively small, trapped water supplies that go undeveloped in conventional vertical well drilling. These systems are closed, gravity powered, inexpensive, efficient, reliable, sanitary and maintenance-free. A point which is stressed is that 'horizontal wells' cannot be drilled just anywhere. Proper site selection, using reliable indicators, and the recognition of the two basic types of trapped waters, the dike and the contact source, are the keys to successful well development. Equipment, methods of development and system advantages are discussed. (Smith-NWWA)

EFFECTIVENESS OF THE OPTIMIZATION OF THE INPLANT REGIMENS OF HYDROELECTRIC PLANTS,
V. D. Urin.
Hydrotechnical Construction, ASCE, No 10, p 976-979, October 1972. 1 fig, 2 tab, 6 ref. (Translated from Gidrotekhnicheskoe Stroitel'stvo, No. 10, p 37-39, October 1972).

Descriptors: *Hydroelectric plants, *Regimen, *Optimization, Dynamic programming, Economic efficiency, Evaluation, Load distribution, Flow, Benefits, Hydraulic structures, Hydraulic turbines, Conduits, Mathematical models, Systems analysis, Equations.
Identifiers: *Effectiveness, Operating characteristics.

Optimization of a hydroelectric plant regimen for a given load calls for the solution of three mutually related problems of selecting the optimum: (a) number of operating units--obtainable from the average characteristics of the units, aided by simple automation; (b) composition of the operating units--effectiveness depends upon number of operating units and number installed; and (c) load distribution among the units. Evaluation is made of the effectiveness of each of the three optimization elements, utilizing the experience obtained from many analyses made at the electric shop of ORGRES Trust from 1966-1969. Flow and relative growth characteristics have been constructed for 20 hydroelectric plants in Transcaucasia, with use made of data from full-scale investigations for 19 of these plants. The inplant regimen was optimized by the method of combined characteristics, which is a graphical analogue of dynamic programming. To control the analyses, the energy characteristics of one of the plants was obtained also by dynamic programming. It is concluded that optimization of the inplant regimens for hydroelectric plants yields substantial advantages and its introduction is necessary in order to increase the technical-economic indices of the plants. PHYSICAL AND THERMAL PROPERTIES OF FROZEN SOIL AND ICE,
Continental Oil Co., Ponca City, Okla.
L. H. Wolfe, and J. O. Thieme.
Society of Petroleum Engineers Journal, Vol 4, No 1, p 67-72, March, 1964. 14 fig, 5 ref.

Descriptors: *Frozen soils, *Ice, Permafrost, *Tensile strength, *Shear strength, *Compressive strength, Thermal conductivity, Specific heat, Thermal properties, Clay, Silt, Soil moisture, Underground storage, Cryogenics, Soil physical properties.
Identifiers: Thermal diffusivity, Liquified gas storage.

Underground storage of cryogenic liquids, such as liquid natural gas, requires prior knowledge of the strength and thermal characteristics of the soil. Methods are described for the measurement of tensile, compressive and shear strengths, specific heats and thermal conductivities of soils. These properties were measured on a clay and a silt, at moisture contents of 17% and 22%, at temperatures from ambient to -195C. Thermal diffusivity values for silt, clay and ice were calculated. Diffusivity increased with the moisture content. Lowering the temperature increased the strength of the soils. Thermal properties of frozen soils are more dependent on moisture content than on temperature. (Gray-NWWA)

THE EFFECT OF STRESS ON PERMEABILITY OF SANDSTONE CORES,
California Univ., Berkely.
I. Fatt.
Society of Petroleum Engineers Journal, Vol 3, No 2, p 95-100, June, 1963. 11 fig, 14 ref.

Descriptors: *Permeability, Permeameters, Flow, Rock properties, *Sandstone, *Stress, Pressure, Earth pressure.
Identifiers: Boise (Idaho), Berea (Ohio), Grubb (California), Permeability anisotropy, Permeability reduction, Nonuniform stress, Radial stress, Axial stress.

Studies are reported on the permeability anisotropy and the permeability under nonuniform stress of cores of Boise, Berea, and Grubb sandstones. Permeability anisotropy was a function of overburden pressure. Increase in applied stress from 0 to 5000 psig caused a significantly greater reduction in vertical permeability than in horizontal. Boise and Berea sandstones showed increasing isotropy at higher applied stress. Permeability reduction under nonuniform stress was less than that under uniform stress. Grubb sandstone was very sensitive to overburden pressure. Permeability reduction of the Berea and Grubb sandstone cores subjected to simulated overburden pressure was a function of the ratio of the radial to axial stress. (Gray-NWWA)

EFFECT OF OVERBURDEN PRESSURE ON SOME PROPERTIES OF SANDSTONES,
California Univ., Berkeley.
V. M. Dobrynin.
Society of Petroleum Engineers Journal, Vol 2, No 4, p 360-366, December, 1962. 12 fig, 14 ref.

Descriptors: *Overburden, *Pressure, Physical properties, *Porous media, *Compressibility, Density, Resistivity, Permeability, Seismic waves, Poisons, Ratio, Mathematical studies, *Sandstones, Pressure.
Identifiers: Longitudinal waves.

Experimental data show that physical properties of porous rocks change under pressure. Two sandstones were examined in the overburden pressure range from 0 to 20,000 psi while the internal pore pressure was atmospheric in one series and 1800 psi in another. Physical properties measured were compressibility, density, resistivity, permeability, and velocity of longitudinal waves. Changes in physical properties are determined to a large extent by the pore compressibility. Pore compressibility can be calculated (in the pressure range investigated) by knowing the maximum pore compressibility andthe magnitude of the pressure. Mathematical equations were developed that describe the effect of pressure on significant physical properties of sandstones. These relationships are shown graphically. (Gray-NWWA)

Descriptors: *Rock properties, *Shear strength, *Stress, Strength, Boreholes, Flow, Saturated flow, Permeability.
Identifiers: *Borehole stability, *Permeability reduction, Displacement distribution, Water shutoff.

In many cases, an increased production rate effected by substantially increasing the pressure gradient through the formation adjacent to the borehole causes excessive sand production, wear of production equipment and necessitates reworking the well. A mathematical analysis was made of the steady state flow rates, stresses and displace-

ments developed in the vicinity of the borehole by applied surface loads and flow of liquids from a rock formation saturated with an incompressible fluid. To prevent rock failure, the rock shear strength must be approximately two-thirds the formation fluid pressure. Permeable rocks sometimes become partially plugged during normal completion and production of a well. The analysis showed that if a region of permeability reduction of 1000:1 extends to a radial thickness of 1 per cent of the borehole diameter, the rock must be about 80 percent stronger than for the unplugged state. No additional rock strength is required for a stable borehole if plugging extends beyond 15 percent of the hole diameter, although a further decrease of production rate is obtained. If gradual plugging occurs during production of a well, the borehole wall will fail when the plugged region extends to a thickness at which the required rock strength exceeds the actual rock strength. (Gray-NWWA)

CORRELATIONS OF PHYSICAL PROPERTIES OF POROUS MEDIA,
Texas A and M Univ., College Station.
W. D. Von Gonten, and R. L. Whiting.
Society of Petroleum Engineers Journal, Vol 7, No 3, p 266-272, September, 1967. 2 tab, 7 ref.

Descriptors: *Physical properties, Correlation analysis, *Regression analysis, *Porosity, *Permeability, Density, *Porous media, Sandstone, Limestone, Young's modulus, Poisson's ratio.
Identifiers: Formation factor, Shaliness factor, Shear modulus, Capillary pressure curve, Pore radius, Displacement pressure.

Physical properties were measured on 568 oil well cores from the Illinois Basin, Rock Mountain area, California, Louisiana and Texas; 478 were sandstone; 90 limestone. Properties obtained on all samples were porosity, grain density, air permeability, formation factor, shaliness factor, mercury-injection capillary pressure curve, midpoint pore radius, average pore radius, equation of capillary pressure curve, and displacement pressure. On 123 sandstone and 61 limestone samples, sonic velocities of the compressional and shear waves were measured and Poisson's ratio, Young's modulus, shear modulus, bulk modulus and sonic velocity were calculated. A regression analysis program was used on a computer to evaluate the coefficients of the equations and to determine which independent variables were significant in each equation. Seven equations are presented for predicting porosity, formation factor and permeability. These equations should be useful in contributing to the understanding of the relationship between the physical properties of porous media. (Gray-NWWA)
W73-14728

THE ALTERATION OF ROCK PROPERTIES BY PERCUSSION SIDEWALL CORING,
Shell Oil Co., Ventura, Calif.
G. M. Webster, and G. E. Dawsongrove.
Petroleum Transactions, AIME, Vol 11, No 4, p 385-388, April, 1959. 12 fig, 1 tab, 1 ref.

Descriptors: *Cores, *Porosity, *Permeability, *Rock properties, *Sandstones, Laboratory tests, Capillary action, Physical properties, Porous media.
Identifiers: Sidewall cores, Conventional cores, Diamond cores, Oil content, Water content, Percussion coring, Thin sections, Photomicrographs.

Percussion sidewall cores from nine oil-productive sandstone zones were compared with conventional cores from the same zones. Photomicrographs of thin sections from sands recovered by percussion sidewall coring indicated some shattering and readjustment of the grains. Disturbance was more pronounced in harder, less porous sands. Porosities of sidewall samples were significantly higher for the less porous sands than for samples from conventional cores. Little difference was noted when the porosity of the conventional core sample was 20% or greater. Limited data indicates that permeabilities of percussion core samples are lower than those of conventional samples, except in the low permeability range, in which case, the reverse may be found. Mercury capillary pressure determinations indicate that the effective pore size and pore size distribution have been appreciably altered in the percussion cores. Somewhat higher water contents and lower oil contents in the sidewall cores can be attributed to invasion of mud filtrate. (Gray-NWWA)

A STUDY OF FORMATION PLUGGING WITH BACTERIA,
Alberta Univ., Edmonton.
J. T. Raleigh, and D. L. Flock.
Journal of Petroleum Technology, Vol 17, No 2, p 201-206, February, 1965. 12 fig, 1 tab, 13 ref.

Descriptors: *Bacteria, *Injection, *Flooding, *Sands, *Limestones, Brines, Porous media, Capillary action, Pores, Rock properties.
Identifiers: *Bacillus subtilis, Capillary pressure curves, Pore-geometry factor, Thomeer, Displacement pressure, *Formation plugging.

The injection of water into formations may be decreased, or the pressure increased, in consequence of plugging of the porous rock by bacteria in the injected water. In a laboratory study, the injection rate and concentration of bacteria were held constant in tests on two sandstones and two limestones. Bacillus subtilis (dead) was suspended in 2.5% sodium chloride solution. The pore geometry factor (Thomeer) was calculated from measurements of properties of the 15 cores examined. The pore geometry factor is a measure of the sorting and interconnection of the pore sizes. Results showed that the factor was a significant rock characteristic for correlation with depth of plugging but failed as an indicator of rate of plugging. Neither permeability nor irreducible water saturation correlated with rate of plugging. The pore geometry factor might have application in establishing injection water specifications in more homogeneous rocks having only primary porosity development. (Gray-NWWA)

R. H. McLean, C. W. Manry, and W. W. Whitaker.
Journal of Petroleum Technology, Vol 19, No 2, p 251-260, February 1967. 19 fig, 2 tab, 16 ref.

Descriptors: *Cements, *Slurries, *Mud, *Casings, Flow, Laminar flow, Turbulent flow, *Non-Newtonian flow, Gels, Yields strength, Reynolds number.
Identifiers: Flow patterns, *Slurry displacement, Eccentric annulus, Mobility ratio, Bingham plastic.

Successful primary cementing of casing leaves no continuous channels of mud capable of flow during subsequent production. A study of the mechanics of mud displacement by cement slurry was made by means of analytical models and displacement experiments. Tendency of the cement to bypass mud is a function of the geometry of the annulus, the density and flow properties of the mud and the cement slurry, and the rate of flow. Bypassing can be prevented if the pressure gradient produced from circulation of the cement and by buoyant forces exceeds the pressure gradient necessary to drive the mud through the narrowest side of the annulus at the same velocity as the cement. Unless the cement slurry has greater density than the mud, the requirement to balance the pressures is to maintain the Bingham yield strength of the cement greater than the yield of the mud multiplied by the maximum distance from the casing to the wall of the borehole and divided by the minimum distance. Thinning a cement slurry can increase turbulent flow in an eccentric annulus but will reduce the efficiency of displacement. Rotation of the casing served to remove the channel of gelled mud that formed between the pipe and the nearby wall in very eccentric annuli. (Gray-NWWA)

RHEOLOGICAL DESIGN OF CEMENTING OPERATIONS,
Halliburton Services, Duncan, Okla.
K. A. Slagle.
Journal of Petroleum Technology, Vol 14, No 3, p 323-328, March, 1962. 2 fig, 2 tab, 10 ref.

Descriptors: *Cements, *Slurries, Hydraulics, *Viscosity, *Turbulent flow, Laminar flow, Reynolds number, Pozzolans, Bentonite, Diatomaceous earth, Non-Newtonian flow, Casings, Viscometers.
Identifiers: API Class A cement, Thixotropy, Fanning friction factor, Rotational viscometer, API RP10B, Hydraulic radius.

Laboratory measurements were made of flow properties of API class A cement slurries and of slurries containing the common cement additives. A multi-speed rotational viscometer was used. From a logarithmic plot of shear rate vs. shear stress, the flow-behavior index and the consistency index were determined. Average values of these factors and of the densities of the slurries are tabulated for samples of cement (API Class A) from seventeen sources. Examples are shown of the application of these properties in field operations to calculate flow rates, pressure drops, and critical velocities to approach turbulent flow in the casing-borehole annulus for several hole diameters. (Gray-NWWA)

A LIQUID FREON PERMEAMETER,
Socony Mobil Oil Co. Inc., Dallas Tex.
B. G. Hurd.
Society of Petroleum Engineers Journal, Vol 2, No 1, p 18-20, March, 1962. 2 fig.

Descriptors: *Permeability, *Permeameters, Rock properties, *Instrumentation, Darch's law, Flow, Porous media, Nitrogen.
Identifiers: *Freon, Dichlorodifluoromethane, Laboratory equipment.

The design of a liquid-Freon permeameter is shown schematically. It can be assembled from stock items of laboratory equipment. The method of use is described. The liquid-Freon permeameter retains the inherent accuracy of the liquid permeameter while affording the speed and ease of operation of the gas permeameter. Replicate measurements and comparison of results with those with conventional liquid and gas permeameters showed adequate precision up to 1000 md. The liquid-Freon permeameter is not recommended for permeabilities higher than 1000 md. (Gray-NWWA)

BURST RESISTANCE OF PIPE CEMENTED INTO THE EARTH,
Gulf Research and Development Co., Pittsburgh, Pa.
R. E. Zinkham, and R. J. Goodwin.
Journal of Petroleum Technology, Vol 14, No 9, p 1033-1040, September, 1962. 9 fig, 1 tab, 20 ref.

Descriptors: *Cements, *Well casings, *Tensile strength, *Compressive strength, Shear, Stress, Design data, Steel pipes, Casings, Strength of materials, Youngs modulus, Mathematical study.
Identifiers: *Burst resistance, *Casing design, Cement sheath, Mud filter cake, Hydraulic fracture.

A modification in casing design practices is proposed that could either reduce the amount and grade of steel required to contain a specified internal pressure, or allow the working pressure to be increased for a specified weight and grade of pipe. A mathematical study was made of the increased burst resistance a cement sheath would provide. Limiting assumptions were: (1) the pipe is completely surrounded by cement, and (2) any mud filter cake between the cement and the earth has the same physical properties as either the cement or the earth. Calculations showed that a cement sheath provides little or no support to the casing when the cement is unconfined or effectively stressed only in tension. When the cement is confined between the pipe and the earth and is loaded in compression, the pipe could receive a substantial amount of support. Data are shown in six charts. The potential usefulness of the cement sheath may be further increased by such downhole conditions as increased pressure, temperature, and confinement. The higher the modulus of elasticity for the cement sheath and the surrounding earth, the greater the amount of support they will give the pipe. (Gray-NWWA)

STRENGTHENING ROCK BY INJECTION OF CHEMICAL GROUT,
Corps of Engineers, Omaha, Nebr. Missouri River Div.
H. B. Erickson.
Journal of the Soil Mechanics and Foundations Division, American Society of Civil Engineers, Vol 94, No SM1, p 159-173, January 1968. 4 fig, 2 tab, 5 ref.

Descriptors: *Grouting, *Rock mechanics, Materials, Rock properties, Underground structures, *Stress, *Shear, *Resins, *Chemical grouting.
Identifiers: Epoxy resin grout, Polyester resin grout, Shear planes, Joints, Stress relief.

After any excavation of cohesive rock, the rock around the new opening contains the original fractures - joints, sheer planes and fractures - plus additional fractures caused by the stress relief inherent in the excavation process. If the openings are not immediately strengthened by some means, individual blocks of rock can rotate out of their original position and weaken the formation through the development of new fracture systems. This may possibly close off the excavation. If, however, the openings are filled with a chemical grout of the proper strength formation stability can be improved. Factors are presented which determine the feasibility of chemical grouting in field situations. Descriptions of equipment, types of grout and methods used for emplacement, and a field case study are also presented. (Smith-NWWA)

FAILURES IN THE BOTTOM JOINTS OF SURFACE AND INTERMEDIATE CASING STRINGS,
Atlantic Richfield Co., Dallas, Tex.
F. J. Schuh.
Journal of Petroleum Technology, Vol 20, No 1, p 93-101, January, 1968. 4 fig, 4 tab, 6 ref.

Descriptors: Casings, *Cement, Pipes, Wells, Rotary drilling, *Welded joints, Joints (Connections), Momentum transfer, Strength of materials, *Well casings.
Identifiers: *Casing failure, *Torque, Cementing plugs, Cementing equipment, Rotary speed, Drill collars, Thread-locking compounds, Pipe threads.

Failure in the bottom joints of casing can require expensive remedial action. Various possible causes of failure were examined. Failures are caused by high energy torque impulses delivered from the drill string while drilling the cementing plugs, cement, and float equipment from the bottom joints of the casing string. The magnitude of the torque impulse is a function of the drill string rotational momentum. Graphs show the minimum rotary speed and collar size required to unscrew casing without and with thread-locked couplings. Recommendations to eliminate failure are: (1) cement all casing strings with two plugs; (2) strengthen the three lowermost couplings joining the bottom four joints (six couplings on seven joints if a bottom plug cannot be used); (3) on J-55 or stronger casing and on all float equipment, clean all threads to be strengthened with suitable solvent before applying thread-locking compounds; (4) on H40 grade, strengthen the connections with a 1/4-inch fillet weld, and (5) limit rotary speed while drilling out cement to a safety factor of two between the torsional strength of the thread-locked joints and the maximum torque impulses of the bottom collars. CATHODIC PROTECTION WORKS,
Harco Corp., Cleveland, Ohio.
H. W. Hosford.
Industrial Water Engineering, Vol 7, No 3, p. 33-34, March, 1970. 3 fig.

Descriptors: *Corrosion control, *Cathodic protection, Cathodes, Equipment, *Coatings, Metal pipes, Engineering structures, Resistivity.
Identifiers: *Stray current corrosion, *Galvanic corrosion, Coal-tar enamel coatings, Sacrificial anodes, Electrical bonding.

Cathodic protection is an electrical method of preventing corrosion. It works by making the metal surface to be protected a cathode of an electrochemical cell. By implication, cathodic protection principals can be used to prevent the corrosion of any metal. This is accomplished by directing an artificial, external current from a sacrificial anode to the cathodic pipe, which makes it impossible for the cathodic pipe itself to corrode. A discussion is presented of the basic types of corrosion and their causes, and the principals of cathodic protection in different corrosive environments with a very basic cost analysis. THE BOREHOLE TELEVIEWER--A NEW LOGGING CONCEPT FOR FRACTURE LOCATION AND OTHER TYPES OF BOREHOLE INSPECTION,
Mobil Research and Development Corp., Dallas, Tex.
J. Zemanex, R. L. Caldwell, E. E. Glenn, Jr., S. V. Holcomb, and L. J. Norton.
Journal of Petroleum Technology, Vol 21, No 6, p 762-774, June, 1969. 15 fig, 14 ref.

Descriptors: *Well logging, *Subsurface investigations, *Acoustics, *Well casings, *Fractures (Geologic), Electrical well logging, Rock properties, Faults (Geologic), Fissures (Geologic), Porosity, Limestone, Borehole cameras.
Identifiers: Fracture orientation, *Borehole television, Acoustic picture, Transducer, Magnetometer, Vugs, Permian formation, Indiced fracture, Casing inspection.

The Borehole Televiewer (BHTV) produces an acoustic picture in the form of a well log. The log, which is run continuously, can define both induced and natural fractures, and can show vuggy porosity, the size and distribution of perforations in casing, and casing failures. The basic method is as follows. A piezoelectric transducer probes the borehole wall with bursts of acoustic energy. Orientation of the log is provided from the earth's magnetic field by a flux-gate magnetometer. A motor rotates the transducer and magnetometer within the tool at about 3 revolutions per second. Appropriate electronic circuits process signals from the transducer and magnetometer for use at the surface. The borehole can be filled with any homogeneous gas-free liquid. The resulting log presents the borehole wall as if it were split vertically and laid flat. Any physical changes in the borehole wall appear as changes in picture intensity. Photographs and diagrams illustrate the operation of the device. Although the instrument is regarded as of greatest utility in the quantitative evaluation of natural and induced fractures where no other logging device is as effective; application to inspection of casing, location of vugs and washouts, identification of lithology, and determination of dip may be equally as significant. (Gray-NWWA)

A FIELD STREAMING-POTENTIAL EXPERIMENT,
Schlumberger Well Surveying Corp., Ridgefield, Conn.
M. Gondouin, H. J. Hill, and M. H. Waxman.
Journal of Petroleum Technology, Vol 14, No 3, p 305-312, March, 1962. 14 fig, 3 tab, 9 ref.

Descriptors: *Electric well logging, *Resistivity, *Drilling fluids, Logging (Recording), Subsurface investigations, Porous media, Shales, Sands, Pressure measuring instruments, Hydrostatic pressure.
Identifiers: *Streaming potential, Spontaneous potential, Induction log, Mud cake, Electrochemical potential.

Measurements were made in the borehole of the streaming-potential behavior of shales and mud cakes within the Muddy- and Dakota-sandstone interval of a Denver basin well. Pressure in these water-bearing sands is low (gradient 0.25 psi per foot) and they are separated by a shale interval of about 150 ft. A series of experiments was made in which the resistivity of the mud filtrate, the pressure in the borehole, and the logging equipment were varied. Streaming potentials opposite shales were of sufficient magnitude to be important in spontaneous potential interpretation. The shale streaming potentials were linearly dependent on the pressure differential and they increased with mud filtrate resistivity. Streaming potentials opposite sands were higher than those opposite shales when the mud was made with fresh water. The characteristics of the mud used in drilling the sand sections influenced the magnitude of the streaming potential at the time of logging, even though the mud used in drilling had been replaced by another mud before logging. Consequently, mud samples taken at the time of logging may not always be suitable for determining streaming potential corrections. Following a change in mud characteristics, several days were required for the spontaneous potential to stabilize. This effect was due in part to the mud cake acting as an imperfect shale membrane. HYDRAULIC JETTING--SOME THEORETICAL AND EXPERIMENTAL RESULTS,
Gulf Research and Development Co., Pittsburgh, Pa.
J. L. Pekarek, D. K. Lowe, and J. L. Huitt.
Society of Petroleum Engineers Journal, Vol 3, No 2, p 101-112, June, 1963. 16 fig, 10 ref.

Descriptors: *Well casing, *Jets, Sand, Sandstone nozzles, Abrasive blasting.
Identifiers: Berea, *Hydraulic jetting, Well cleanout, *Jet perforating, Notch cutting, Casing perforation, Casing cutting.

The use of a fluid containing an abrasive material has been an established technique for cleaning and cutting in well casings for many years. The use of hydraulic jetting in well completion has become an accepted practice. A theoretical analysis of the mechanism of hydraulic jetting showed that the abrasive material exits from the jet nozzle at a lower velocity than the fluid. The exit particle velocity can be increased by increasing either the density of the fluid or the length of the nozzle and/or decreasing either particle density or particle diameter. There is a point in the divergent jet stream after which the particle velocity exceeds that of the fluid. An equation was derived to predict cutting rate of a circumferential notch and maximum notch depth. The theoretical predictions were substantiated by experimental results, using sand in water as the abrasive material. In addition, some studies were made of the effects of back pressure in the annulus; the distance between the nozzle exit and the casing; the rotational speed of the tool, and the concentration of the abrasive particles. EXPERIMENTAL TESTS OF A METHOD FOR DRILLING WITH EXPLOSIVES,
Esso Production Research Co., Houston, Tex.
L. H. Robinson.
Society of Petroleum Engineers Journal, Vol 5 No 2, p 153-159, June, 1965. 10 fig, 3 ref.

Descriptors: *Rotary drilling, *Explosives, *Drilling equipment, *Rock excavation, Craters, Drilling, Sandstones, Metamorphic rocks, Limestones.
Identifiers: *Shaped charges, Primacord, Detonator, Shock waves, Pentolite, Fracturing.

A proposed method of drilling utilizes sequential detonation of two types of explosive charges delivered to the hole by a conventional drilling fluid through pipe. A shaped charge first produces a long thin hole. A second charge, called a gauging charge, is pumped into the thin hole. The charge explodes and enlarges the hole to gauge. The proposed method was experimentally tested at the surface on 2-ft. cubes of Berea sandstone and on low-porosity (0.4%) metamorphic limestone. The test equipment is shown in diagrams and the results are illustrated by photographs. The proposed technique indicated a charge-to-rock removal ratio that would make the process feasible for drilling wells. A possible drilling sequence with modified rotary equipment is outlined. PARAMETRIC DETERMINATION OF MINIMUM STREAM FLOW FOR TROUT,
Wyoming Univ., Laramie. Water Resources Research Inst.
T. A. Wesche.
Available from the National Technical Information Service as PB-223 377, $4.25 in paper copy, $1.45 in microfiche. Water Resources Series No. 27, June 1973. 102 p, 40 fig, 6 tab, 27 ref. OWRR B-007-WYO (3).

Descriptors: *Trout, *Wyoming, Average flow, *Parametric hydrology, Brown trout, Aquatic habitats.
Identifiers: *North Platte River basin (Wyo), *Average daily flow, Trout cover.

The approach taken in the determination of a suitable minimum flow to be maintained in a stream channel for the preservation of trout populations has centered on three types of physical stream characteristics and the changes observed in them between various discharge levels, based on the average dialy flow (ADF) over the period of record: hydrologic parameters; surface areas and its composition, based on water depth and velocity; and available trout cover. Portions of Douglas Creek and Hog Park Creek, relatively small streams (average daily flows approximately 30 cubic feet per second) located in the North Platte River drainage of southeastern Wyoming, were intensively investigated in the summer and fall of 1972 at 200%, 100%, 50%, 25%, and 12.5% ADF. Water depth, velocity, cross-sectional area, wetted perimeter, hydraulic radius, top width, total surface area, surface area of depth 0.5 feet or greater, and available brown trout cover decrease at the greatest rate for the discharge reduction interval from 25% to 12.5% ADF. As a minimum flow, a discharge in the 25% ADF range will avoid the flow range for which the rate of habitat decrease is greatest.

HYBRIDIZATION IN THE ACIPENSERIDAE FAMILY AND PERSPECTIVE USE OF IT IN STURGEON FARMING, (IN RUSSIAN),
N. I. Nikolyukin.
Tr Vses Nauchno-Issled Inst Morsk Rybn Khoz Okeanogr. 76 p 56-69. 1970. (English Summary.

Identifiers: *Acipenseridae family, *Hybridization, *Sturgeon farming

The most interesting sturgeon hybrid is great sturgeon X sterlet. The first and the second generation from repeated crossing with the female great sturgeon is recommended for commercial production. The repeat hybrid differs from F1 by its faster growth with greater variability, which widens possibilities for slection. Fertility of the great sturgeon X sterlet opens possibilities for new forms with hereditary stability for both the pond and diadromous species. --Copyright 1972, Biological Abstracts, Inc

PUYALLUP HATCHERY POND AND PUMPING PLANT CONSTRUCTION,
Washington State Dept of Fisheries, Olympia
R. K. Jones
Available from NTIS, Springfield, Va 22151 as COM-72-11331. Price $3.00 printed copy; $1.45 microfiche. Contract Completion Report to NOAA, National Marine Fisheries Service, May 1972. 10 p, append

Descriptors: *Fish hatcheries, *Fish reproduction, *Engineering structures, *Salmon, *Washington, Ponds, Concrete construction, Asphalt, Fish migration, Costs, Fisheries
Identifiers: *Orting (Wash), *Puyallup Salmon Hatchery (Wash).

A construction program is described for the Puyallup Salmon Hatchery located on Voights Creek about 1.5 miles east of Orting, Washington. This project consisted of three jobs: (1) construction of four concrete ponds in accordance with Engineer-approved plans and specifications; (2) construction of two 1/4-acre ponds and related supply and drain lines in accordance with Engineer-approved plans and specifications; and (3) an existing rack and a fishway, pumping unit were reconstructed and supply lines were connected. The total cost of this project was $160,789.58 shared equally by the State and by the Federal Government. The additional ponds and water supply should increase production of the Puyallup Hatchery by 57,000 pounds of salmon. (Woodard-USGS)

ELK RIVER SALMON HATCHERY EXPANSION,
Oregon Fish Commission, Portland.
E. K. Neubauer.
Available from the National Technical Information Service as COM-72 11071. National Marine Fisheries Service, Completion Report Project No AFC-59, March 1972. 4 p. NMFS project AFC-59, Contract 14-17-0001-2338.

Descriptors: *Construction costs, *Salmon, *Fish hatcheries, Design, *Oregon.
Identifiers: *Elk River (Ore.), Hatchery expansion.

A final summary of the expansion of the Elk River Salmon Hatchery's rearing capacity from 1 million to 1.7 million smolts is presented. The estimated project cost of $228,000 was equally shared by the Oregon Fish Commission and the National Marine Fisheries Service. The Commission's Division of Engineering was responsible for design and contract document preparation. Because initial bids received on July 31, 1970 exceeded the available funds, the design was altered and new bids were called. The contract was awarded to Richard L. Mertin, Inc. on March 29, 1971 for the low bid of $186,708. Construction began April 5 and proceeded according to contract requirements with no unusual delays or other problems. Three Change Orders were issued during construction which called for quality of material improvements, thus raising the final general contract cost to $206,760. Final inspection on December 13, 1971

found all work complete and acceptable. After purchase of 22 16-tray incubators and a minor test fee, the project closed with an unexpended balance of $6,656. (Weaver-Wisconsin)

Identifiers: *Cascade River (Wash), Skagit County (Wash).

Boulders and ledges in the bed of the Cascade River, Skagit County, Washington, were altered to widen the stream channel and reduce the gradient to enhance passage of chinook and coho salmon. Drilling and blasting of one large granite boulder, ledges and other rock leveled the area to existing water surface or lower, thereby widening the stream channel and reducing the abrupt gradient to provide easier fish passage. Observations have been made periodically of the work area to determine passage conditions at various streamflows. Some of the blasted rock remains in the stream channel but it does not hinder migration. (Woodard-USGS)

ESTIMATION OF ROTENONE CONCENTRATION BY BIOASSAY,
New York State Dept. of Environmental Conservation, Delmar. Wildlife Research Lab.
H. A. Loeb, and R. Engstrom-Heg.
N Y Fish Game J, Vol 18, No 2, p 129-134, 1971, Illus.
Identifiers: *Bioassay, Fishery management, *Rotenone, Salmo-trutta, *Brown trout.

Concentration-response curves were determined for brown trout (Salmo trutta) placed in water dispersions of emulsifiable rotenone. The response measured was loss of equilibrium. The values obtained yielded linear plots on logarithmic paper, when estimated threshold values were subtracted from the concentrations and response times. Linear plots were also obtained by plotting reciprocals of response times against logarithms of concentrations, using semi-logarithmic paper. The intercept of the regression line with the log concentration axis is an estimate of the threshold concentration. The curves obtained have proved to be reliable indicators of residual rotenone concentrations, particularly within the 0.05 to 0.3 ppm concentration range.--Copyright 1973, Biological Abstracts, Inc.

RECOLONIZATION OF A ROTENONE--TREATED SEGMENT OF THE TEN MILE RIVER,
New York State Dept. of Environmental Conservation, Delmar. Wildlife Research Lab.
R. Engstrom-Heg, and H. A. Loeb.
N Y Fish Game J, Vol 18, No 2, p 135-138, 1971.
Identifiers: American eel, Biomass (Fish), Eel, Fish populations, Rivers, *Rotenone, *New York (Ten Mile River), *Recolonization (Fish).

Recolonization of the upstream 500 ft of a 2100-ft rotenone-treated section of the Ten Mile River was studied over a 10-mo. period. At the end of the period, the fish population and fish biomass were estimated as 69.2 and 32.1% of their respective pretreatment values. Immigrant fish of most species tended to be smaller and younger than fish of the same species in the pretreatment population. A notable exception was the American eel, the species contributing most to the fish biomass.--Copyright 1973, Biological Abstracts, Inc.

EFFECTS OF CONTROLLED FLOW REDUCTION ON A TROUT STREAM,
Alberta Dept. of Lands and Forests, Red Deer. Fish and Wildlife Div.
M. E. Kraft.
J Fish Res Board Can, Vol 29, No 10, p 1405-1411, 1972, Illus.
Identifiers: Controlled flow, Movements (Fish), Streams, Tag, *Trout, *Montana (Blacktail Creek).

The total number of brook trout age I and older in 3 runs of Blacktail Creek, Montana, was reduced approximately 62% when 90% of the normal flow was diverted for about 3 mo., in comparison with 20% for runs in control sections. Both number and weight of trout in pools of the test sections generally increased, whereas those in control pools decreased. Recaptures of tagged trout also indicated movements from runs to pools in the test sections, but not in the control sections. When the flow was reduced 75% or less, there were no consistent changes in number or weight of trout in the test runs and pools, whereas those in the control sections were more marked though also inconsistent. Reduced flows had no consistent effect on the number of underyearlings. The changes in most physical characteristics after 90% flow reduction were considerably less than the degree of reduction, presumably because the stream flowed in a well defined channel. Surface area and average depth were least affected (about 42% decrease) and current velocity (75%) the most. Fast-water portions (current velocity over 0.30 m/sec) comprised over 60% of the surface area at normal flows and slow water portions over 85% of the area when the flow was reduced 90%. A multiple linear regression with the physical characteristics as independent variables and the number of trout as the dependent variable accounted for over 75% of the variation in the number of age I and older trout in runs and pools.--Copyright 1973, Biological Abstracts, Inc.

INVENTORY OF WATER RESOURCES CONDUCTED IN MINNESOTA 1963 THROUGH 1972,
Minnesota Univ., St. Paul. Water Resources Research Center.
W. C. Walton.
Available from the National Technical Information Service as PB-223 432, $7.25 in paper copy, $1.45 in microfiche. Bulletin 65. August 1973. 95 p, 7 tab. OWRR A-028-MINN (2).

Descriptors: *Water resources, *Research, *Minnesota, Manpower, *Universities, Training, Education, *Federal government, *Projects, Industries, Utilities.

Total annual water resource research effort in Minnesota in terms of number of ongoing projects increased from 65 in 1963 to 149 in 1971 and was 140 in 1972. The estimated annual man-years of effort rose from 41.1 in 1963 to 200.1 in 1972. Total annual expenditures increased from $620,000 in 1963 to $3,900,000 in 1972. In 1972, Federal agencies conducted the greatest amount (50 percent of total) of water resources research in Minnesota with the University of Minnesota, Consultant, Private Organizations, State and Private Colleges and State agencies following in that order. The percentages of the total research conducted by individual Federal agencies were as follows: Environmental Protection Agency (National Water Quality Laboratory) - 42, U. S. Department of Agriculture (Agricultural Research Service) - 4, U. S. Department of Agriculture (Forest Service) - 2, and U. S. Department of the Interior (Geological Survey) - 2. Organizations funding the greatest amounts of water resources research in 1972 were: Environmental Protection Agency, U. S. Department of the Interior, U. S. Department of Agriculture, U. S. Department of Navy, National Science Foundation, Atomic Energy Commission, Northern States Power Company, Department of Defense and State agencies.

SUBJECT INDEX

ACACIA
Ecological Response of the Australian Native Species Acacia Harpophylla and a Triplex Nummularia to Soil Salinity: Effects on Water Content, Leaf Area, and Transpiration Rate,
W73-14472 3C

ACIDIZING
Factors that Affect Well Life,
W73-14723 8B

ACIPENSERIDAE FAMILY
Hybridization in the Acipenseridae Family and Perspective Use of it in Sturgeon Farming, (In Russian),
W73-14280 8I

ACOUSTICS
The Borehole Televiewer--A New Logging Concept for Fracture Location and Other Types of Borehole Inspection,
W73-14721 8G

ACTIVATED CARBON
Feasibility Study of a Nuclear Power-Sewage Treatment System for the Conservation and Reclamation of Water Resources,
W73-14360 5D

Influence of Surface Oxides on Adsorption and Catalysis with Activated Carbon,
W73-14394 5D

Simple Water Treating Apparatus,
W73-14695 5F

ACTIVATED SLUDGE
Discharge of Nitrilotriacetate (NTA) From Two Sewage Treatment Facilities Located in a Mid-continental Climate,
W73-14294 5B

Proteins in Wastewater and Wastewater Sludges,
W73-14311 5A

ACTIVATED SLUGE
Sludge Conditioning Using SO2 and Low Pressure for Production of Organic Feed Concentrate,
W73-14222 5D

ADMINISTRATIVE AGENCIES
The Place of Local Authorities in the Management and Development of Water Resources,
W73-14230 6E

ADSORPTION
A Pilot Plant Investigation of the Pulsed Adsorption Bed Process,
W73-14389 5D

Influence of Surface Oxides on Adsorption and Catalysis with Activated Carbon,
W73-14394 5D

AERATED LAGOONS
Discharge of Nitrilotriacetate (NTA) From Two Sewage Treatment Facilities Located in a Mid-continental Climate,
W73-14294 5B

AERATION
Artificial Aeration as a Substitute for Wastewater Treatment,
W73-14464 5G

Waste Treatment System,
W73-14691 5D

AERIAL PHOTOGRAPHY
The Use of Remote Sensing Techniques in the Arid Lands of Australia,
W73-14335 7B

Production of Thematic Maps by Optical Analog Processing of Color Transparencies,
W73-14339 7B

Monitoring the Effects of a Changing Resource Base in an Arid Lands Area: The West Side of the San Joaquin Valley, California,
W73-14345 7B

Strip-mined Watershed Hydrologic Data Acquisition Study,
W73-14368 7B

The Circulation of Prince William Sound,
W73-14588 2L

Estuarine and Coastal Water Dynamics Controlling Sediment Movement and Plume Development in Long Island Sound,
W73-14590 2L

Time Sensing and Analysis of Coastal Waters,
W73-14631 2L

AEROBIC TREATMENT
Batch Sewage Treatment System and Method,
W73-14694 5D

AESTHETICS
Shoreline Analysis of the City of Sarasota.
W73-14239 6B

The Urban River: A Staff Proposal for Waterfront Development in the District of Columbia.
W73-14686 3D

AGE
Date of Maximum Advance of the Last Glaciation Near Grodno (O vozraste maksimal'noy stadii poslednego oledeneniya v rayone Grodno),
W73-14436 2C

AGRICULTURAL WASTES
Dentrification by Anaerobic Filters and Ponds - Phase II.
W73-14219 5D

AGRICULTURE
Future Allocations of Land and Water: Implications for Agricultural and Water Policies,
W73-14521 6D

AIR POLLUTION
Environmental Analysis Problems Created by Unexpected Volatile Beryllium Compounds in Various Samples,
W73-14299 2K

Remote Analysis of Airborne Particles by Polarimetry,
W73-14341 7B

AIR-WATER INTERFACES
Systematic Treatment of Infiltration with Application,
W73-14205 2G

AIRCRAFT
Basic Considerations of High Resolution Side-Looking Radar Imagery,
W73-14332 7B

ALABAMA
Restoration of Alabama's Supply of Seed Oysters,
W73-14595 2L

Environmental Effects of Hydraulic Dredging in Estuaries,
W73-14621 5C

ALASKA
The Limnology of Two Dissimilar Subarctic Streams and Implications of Resource Development,
W73-14203 5B

Metallogenic Significance of Alaskan Geostructures Seen on Nimbus and ERTS Images,
W73-14331 7C

The Circulation of Prince William Sound,
W73-14588 2L

Forecast of the 1972 Pink Salmon Runs, Southeastern Alaska,
W73-14591 2L

A Numerical Model of a Fjord Estuary. I. Basic Considerations and Proposed Finite Difference Schemes,
W73-14619 2L

Oceanographic Surveys of Traitors Cove Revillagigedo Island, Alaska,
W73-14657 2L

Some Aspects of the Oceanography of Little Port Walter Estuary, Baranof Island, Alaska,
W73-14665 2L

ALCOHOLS
The Metabolism of Long-Chain Fatty Acids and Alcohols by Candida Tropicalis and Saccharomyces Cerevisiae,
W73-14325 5C

ALFALFA
Economic Aspects of Sloping Land Drainage,
W73-14523 4A

ALGAE
Algal Photosynthesis, Algal Abundance, and Chemistry of Lake Water at Fairmont, Minnesota,
W73-14364 5C

Interception and Degradation of Pesticides by Aquatic Algae,
W73-14469 5C

ALGORITHMS
Identification of Parameters in Finite Leaky Aquifer System,
W73-14376 2F

ALLUVIUM
The Relationship Between Soil Structure Factor and Both Soluble and Exchangeable Sodium and Calcium in the Nile Alluvium of Egypt,
W73-14474 2G

ALPINE FLORA
Origins and Ecology of the Sierran Alpine Flora and Vegetation,
W73-14545 4A

ALTERNATIVE PLANNING
Guidelines for Systems Planning Investigations and Optimum Utilization of Water Resources and Norms in a Developing Area,
W73-14672 6A

ALUMINUM
Determination of Aluminium by Atomic Absorption Spectrophotometry after Chelation with Oxine and Extraction with Methyl Isobutyl Ketone,
W73-14454 5A

AMARILLO (TEX)
Amarillo, Texas: Report on Sanitary Sewerage and Sewage Treatment, 1967.
W73-14501 5D

AMINO ACIDS
Plant Phenols and Related Organic Compounds in Public Water Sources, Their Relationship to Chlorination,
W73-14468 5B

Stress Metabolism. II: Changes in Proline Concentration in Excised Plant Tissues,
W73-14503 3F

Stress Metabolism. IV: The Influence of (2-Chloroethyl) Trimethylammonium Chloride and Gibberellic Acid on the Growth and Proline Accumulation of Wheat Plants During Water Stress,
W73-14505 3F

Stress Metabolism. III: Variations in Response to Water Deficit in the Barley Plant,
W73-14506 3F

AMMONIA
Determination of Ammonia in Aquaria and in Sea Water Using the Ammonia Electrode,
W73-14298 5A

AMMONIA STRIPPING TOWERS
Mathematical Simulation of Ammonia Stripping Towers for Wastewater Treatment,
W73-14229 5D

ANADROMOUS FISH
Forecast of the 1972 Pink Salmon Runs, Southeastern Alaska,
W73-14591 2L

ANAEROBIC FILTERS
Dentrification by Anaerobic Filters and Ponds - Phase II.
W73-14219 5D

ANALYTICAL TECHNIQUES
Effects of Pollution on Freshwater Fish,
W73-14259 5C

Aquatic Sediments,
W73-14265 5C

Organics,
W73-14317 5A

ANIMAL POPULATIONS
The Mayfly (Ephemeroptera) in Trout Streams of the Beskids. II. Production, Die Eintagsfliegen (Ephemeropta) in Forellenbachen Der Beskiden. II. Produktion),
W73-14292 5A

ANIMAL TISSUES
Effects of Pollution on Freshwater Fish,
W73-14259 5C

Preliminary Survey of Mercury and Other Metals Contained in Animals From the Fraser River Mudelats,
W73-14293 5B

ANION EXCHANGE
Rapid, Selective Method for Lead BY Forced-Flow Liquid Chromatography,
W73-14295 5A

ANISOTROPY
Effect of Anisotropy and Stratification on Pressure Transient Analysis of Wells with Restricted Flow Entry,
W73-14710 8B

ANNUAL
Investigation of the Nature of Variations in Annual Runoff Coefficients in West Siberia (Issledovaniye prirody kolebaniy koeffitsiyentov godovogo stoka Zapadnoy Sibiri),
W73-14429 2E

ANTHROPOLOGY
The Application of Space Imagery to Anthropology,
W73-14342 7B

The Kin Bineola Irrigation Study: An Experiment in the Use Of Aerial Remote Sensing Techniques in Archaeology,
W73-14343 7B

ANTITRANSPIRANTS
Efficiency of Water Use as Influenced by Micrometeorological and Physiological Processes,
W73-14206 2D

AQUARIA
Determination of Ammonia in Aquaria and in Sea Water Using the Ammonia Electrode,
W73-14298 5A

AQUATIC ALGAE
Summer Algal Communities and Primary Productivity in Fish Ponds,
W73-14315 5C

AQUATIC ANIMALS
Some Rotifers from Cambodia,
W73-14313 2I

Concerning the Influence of Herbicides on Several Freshwater Animals, Uber Den Einfluss Der Herbizide Auf Einige Susswassertiere,
W73-14437 5C

AQUATIC FUNGI
Selected Pesticides in Aquatic Fungi in the Three Rivers Area,
W73-14207 5A

AQUATIC INSECTS
Aquatic Insect Communities in the Rivers of the Yoro, Obitsu, and Isumi, Chiba Prefecture, Japan, (In Japanese),
W73-14617 5B

AQUATIC LIFE
Thermal Effects,
W73-14268 5C

AQUATIC POPULATION
A Preliminary Baseline Study of Roberts and Sturgeon Banks,
W73-14486 5A

AQUATIC SOILS
Aquatic Sediments,
W73-14265 5C

AQUEOUS SOLUTIONS
Spectrophotometric Determination of Calcium,
W73-14251 2K

Interferences in Nickel Determinations by Atomic Absorption Spectrometry,
W73-14288 2K

Rapid, Selective Method for Lead BY Forced-Flow Liquid Chromatography,
W73-14295 5A

Direct Determination of Phosphorus by Atomic Absorption Flame Spectrometry,
W73-14296 5A

Determination of Trace Phenol in Aqueous Solution by Aqueous Liquid Chromatography
W73-14303 5A

The Spectrophotometric Determination of Palladium with 4- ((5-Chloro-2-Pyridyl)AZO)-1,3-Diaminobenzene,
W73-14440 5A

Determination of Aluminium by Atomic Absorption Spectrophotometry after Chelation with Oxine and Extraction with Methyl Isobutyl Ketone,
W73-14454 5A

AQUICLUDES
Unsteady Two-Dimensional Flow of Water in Unsaturated Soils Above an Impervious Barrier,
W73-14426 2G

AQUIFER CHARACTERISTICS
Mathematical Management Model of Parts of The Ogallala Aquifer, Texas,
W73-14359 4B

Optimal Identification of Aquifer Parameters in a Distribute System,
W73-14375 2F

Identification of Parameters in Finite Leaky Aquifer System,
W73-14376 2F

Temperature Prospecting for Shallow Glacial and Alluvial Aquifers in Illinois,
